'You've got to do something. Our kid can't stand this. She's coming down with croup and we can't get at her to help her.’

MacRae crowded forward. ‘You should have brought her to me, Joe.’ He looked the baby over, through the plastic, then announced, ‘The kid seems to be doing all right.’

'She's sick, I tell you.’

'Hmm—I can't make much of an examination when I can't get at her. Can't take her temperature, but she doesn't seem to be in any real danger.’

'You're just trying to soothe me down,’ Hartley said angrily. ‘You can't tell anything about it when she is in a sealed crib.’

'Sorry, son,’ the doctor answered.

'A lot of good it does to be sorry! Somebody's got to *do* something. This can't —’ His wife plucked at his sleeve; he turned away and they went into a huddle. Shortly he turned back. ‘Captain Marlowe!’

'Yes, Mr Hartley.’

'The rest of you can do as you like. I've had enough. I've got my wife and baby to think about.’

'The decision is yours,’ Marlowe said stiffly and turned away in abrupt dismissal.

'But —’ said Hartley and stopped, aware that Marlowe was no longer paying any attention to him. He looked uncertain, like a man who wants someone to argue him out of his resolution. His wife touched his arm; he turned then and they went together to the front entrance.

Marlowe said to MacRae, ‘What do they expect of me? Miracles?’

MacRae answered, ‘Exactly, boy. Most people never grow up. They expect papa to get ‘em the pretty Moon.’ The doctor went on, ‘Just the same, Joe accidentally told the truth. We've got to do something.’

'I don't see what we can do until Sutton and Toland get some results.’

'You can't wait any longer for them, son. We've got to crush out of here anyway. Theoretically a man can live for days in a respirator. Practically, it won't work and that is what Beecher is counting on. You can't keep several hundred people crouching here in the dark and the cold, wearing masks to stay alive, not indefinitely. You're going to have a panic on your hands.’

Marlowe looked weary, even through his mask. ‘We can't tunnel out. We can't get out at all, except through the doors. And they've got those doors zeroed. It's suicide.’

'It's got to be done, son. I'll lead the rush.'

Marlowe sighed. 'No, I will.'

'You've got a wife and kids. I've got nobody and I've been living on borrowed time so long I've lost track.'

'It's my privilege. That settles it.'

'We'll see.'

'I said that settles it, sir!'

The argument was left unfinished; the inner door to the pressure lock opened again and Mrs Hartley stumbled inside. She was clutching the tiny crib and sobbing wildly.

It was the case of the Pottles and Gibbs all over again. When MacRae was able to make something out of her sobs, it appeared that they had been very cautious, had waited, had shouted their intention to surrender, and had displayed a light. There had been no answer, so they had shouted again, then Hartley had stepped off the threshold with his hands up and his wife shining the light on him.

He had been struck down as soon as he stepped out the door.

MacRae turned her over to the women, then went out to reconnoitre. He came back in almost at once. 'Somebody get me a chair,' he demanded, and looked around. 'You, Jim—skedaddle.'

'What's up?' asked Marlowe.

'Let you know in a moment. I suspect something.'

'Be careful.'

'That's why I want the chair.'

Jim came back with one; the doctor went through the pressure lock again. He came back in about five minutes later. 'It's a booby trap,' he stated.

'What do you mean?'

'Beecher didn't try to keep men outdoors all night—at least I don't think so. It's automatic. They've put an electric-eye grid across the door. When you break it, a bolt comes across, right where you'd be if you walked through it.' He displayed half a dozen deep burns through the chair.

Marlowe examined them. 'But that's not the important point,' MacRae went on. 'It's automatic but it's inflexible. It hits about two feet above the step and about four feet. A man could crawl through it—if his nerves were steady.'

Marlowe straightened up. 'Show me.'

They came back, with the chair still more burned, in a few minutes. 'Kelly,' Marlowe said briskly, 'I want twenty volunteers to make a sortie. Pass the word around.'

There were at least two hundred volunteers; the problem was to weed them down. Both Frank and Jim tried to get in on it; Jim's father refused to take any but grown, unmarried men—except himself.

MacRae he refused.

The doctor pulled Jim back and whispered to him. ‘Hold your horses. In a few minutes I'll be boss.’

The raiding party started into the lock. Marlowe turned to MacRae. ‘We'll head for the power plant. if we are gone more than two hours, you are on your own.’ He went into the lock and closed the door.

As soon as the door was closed, MacRae said, ‘Okay, twenty more volunteers.’

Kelly said, ‘Aren't you going to wait two hours?’

'You tend to your knitting! When I'm out of here, you're in charge.’ He turned and nodded to Jim and Frank. ‘You two come along.’ MacRae had his party in short order, had apparently selected them in his mind before Marlowe left. They filed into the lock.

Once the outer door was open MacRae flashed his torch into the street. The Pottles and the unfortunate Joseph Hartley lay where they had fallen, but no other bodies littered the street. MacRae turned around and said, ‘Gimme that chair. I'll demonstrate the gimmick.’ He stuck it out into the door. Instantly two bolts cut across the doorway, parallel to the ground. After they were gone and the eye was still dazzled by their brilliance, two soft violet paths of ionization marked where they had been and then gradually dispersed.

'You will note,’ said the doctor, as if he were lecturing medical students, ‘that it does not matter where the chair is inserted.’ He again shoved the chair into the opening, moved it up and down. The bolts repeated at splitsecond intervals, but always at the same places, about knee high and chest high.

'I think it is best,’ continued the doctor, ‘to maintain the attack. Then you can see where you are. First man!’

Jim gulped and stepped forward—or was shoved, he was not sure which. He eyed the deadly fence, stooped over, and with awkward and infinite care stepped through. He went on out into the street. ‘Get moving!’ the doctor ordered. ‘Spread out.’

Jim ran up the street, feeling very much alone but terribly excited. He paused short of the end of the building and cautiously looked around the corner. Nothing either way—he stopped and waited in the darkness, ready to blast anything that moved.

Ahead of him and to the left he could see the curious structure which had almost cost him the top of his head many hours before. It was clear now that the bolts were coming from it.

Someone came up behind him. He whirled and heard a voice yelp, ‘Don't shoot! It's me—Frank.’

'How about the others?’

'They're coming—I think.’

A light flashed at the building ahead, beyond the shield from which the bolts came. Frank said, ‘I think somebody came out there.’

'Can you see him? Do you think we ought to shoot?’

'I don't know.’

Someone else was pounding up the street behind them. Up ahead, from near the spot where Frank had thought he had seen a man a heater flashed out in the darkness; the beam passed them.

Jim's gun answered by pure reflex; he nailed the spot from which the flash had come. ‘You got him,’ said Frank. ‘Good boy!’

'I did?’ said Jim. ‘How about the guy behind me?’ He found that he was trembling.

'Here he is now.’

'Who shot at me?’ the newcomer said. ‘Where are they?’

'Nowhere at the moment,’ Frank answered. ‘Jim nailed him.’ Frank tried to peer into the mask; the night was too dark. ‘Who is it?’

'Smitty.’

Both Frank and Jim gave exclamations of surprise—it was Smythe, the practical man. ‘Don't look at me like that,’ Smythe said defensively. ‘I came along at the last minute—to protect my investment. You guys owe me money.’

'I think Jim just paid it off,’ suggested Frank.

'Not on your life! That's another matter entirely.’

'Later, later,’ said Frank. Others were coming up. Presently MacRae came puffing up and roared, ‘I told you bird brains to spread out!’ He caught his breath and said, ‘We tackle the Company main offices. Dogtrot—and don't bunch together.’

'Doc,’ said Jim, ‘there are some in that building up ahead.’

'Some what?’

'Somebody that shoots at us, that's what.’

'Oh. Hold it, everybody.’ MacRae gave them hoarse instructions, then said, ‘Got it, everybody?’

'Doc,’ asked Frank, ‘how about the gun over there? Why don't we wreck it first?’

'I must be getting old,’ said MacRae. ‘Anybody here enough of a technician to sneak up on it and pull its teeth?’

A faceless figure in the darkness volunteered. ‘Go ahead,’ Doc told him. ‘We'll cover you from here.’ The colonial trotted ahead, swung around behind the shield covering the stationary automatic blaster, and stopped. He worked away for several minutes, then there was a white flash, intensely bright. He trotted back. ‘Shorted it out. Bet I blew every overload breaker in the power house.’

'Sure you fixed it?’

'You couldn't dot an “i” with it now.’

'Okay. You —’ MacRae grabbed one of his squad by the arm. ‘—tear back and tell Kelly. You —’ He indicated the chap who had wrecked the gun. '— go around in back and see what you can do with the set up back there. You two guys cover him. The rest of you follow me—the building ahead, according to plan.'

Jim's assignment called for sneaking along the face of the building and taking a covering position about twenty feet short of the doorway. His way led him over the ground where the man had been at whom he had shot. There was no body on the pavement; he wondered if he had missed. It was too dark to look for blood.

MacRae gave his covering troops time to reach their stations, then made a frontal assault with six to back him up, among them Frank. The doctor himself walked up to the building entrance, tried the outer door. It opened. Motioning the assault group to join him, he went in. The outer door of the building's lock closed on them.

Jim huddled against the icy wall, eyes wide, ready to shoot. It seemed a cold eternity that he waited; he began to fancy that he could see some traces of dawn in the east. At last he saw silhouettes ahead, raised his gun, then identified one as Doc's portly figure.

MacRae had the situation in hand. There were four disarmed prisoners; one was being half carried by two others. 'Take 'em back to the school,' Doc ordered one of his group. 'Shoot the first one of them who makes a funny move. And tell whoever is in charge back there now to lock 'em up. Come on, men. We've got our real job ahead.'

There came a shout behind them; MacRae turned. Kelly's voice called, 'Doc! *Wait for us!'* He came running up and demanded, 'What are the plans?' Behind him, men were pouring out of the school and up the street.

MacRae took a few minutes to recast things on the basis of more guns. One of the platoon leaders, a civil engineer named Alvarez, was left in charge at the school with orders to maintain a guard outside the building and to patrol the neighbourhood with scouts. Kelly was assigned the task of capturing the communications building which lay between the settlement and the space port. It was an important key to control of the whole situation, since it housed not only the local telephone exchange but also the radio link to Deimos and thence to all other outposts on Mars—and also the radar beacons and other aids for incoming ships from Earth.

MacRae reserved for himself the job of taking the planet office—the main offices on Mars of the Company, Beecher's own headquarters. The Resident Agent General's personal apartment was part of the same building; the doctor expected to come to grips with Beecher himself.

MacRae sent a squad of men to reinforce Marlowe at the power house, then called out, 'Let's go, before we all freeze to death. Chop, chop!' He led the way at a ponderous trot.

Jim located Frank in the group and joined him. ‘What took you guys so long in that building?’ he asked. ‘Was there a fight?’

'Took so long?’ said Frank. ‘We weren't inside two minutes.’

'But you must have —’

'Cut out that chatter back there!’ called out Doc. Jim shut up and pondered it.

MacRae had them cross the main canal on ice, avoiding the arching bridge as a possible trap. They crossed in pairs, those behind covering those crossing; in turn they who had crossed spread out and covered those yet to come. The crossing held a nightmarish, slow-motion quality; while on the ice a man was a perfect target—yet it was impossible to hurry. Jim longed for his skates.

On the far side the doctor gathered them together in the shadow of a warehouse. ‘We'll swing around to the east and avoid the dwellings,’ he told them in a hoarse whisper. ‘From here on, *quiet!*—for your life. We won't split up because I don't want you shooting each other in the dark.’ He set forth a plan to surround the building and cover all exits, while MacRae himself and about half their numbers tried to force an entrance at the main door.

'When you get around in back and make contact,’ MacRae warned the two who were to lead the flanking and covering moves, ‘you may have one deuce of a time telling friend from foe. Be careful. The word is Mars; the answer is Freedom.’

Jim was in the assault party. Doc stationed six of them in fan shape around the door, at an easy twenty-five yards range, and had them take cover where available. Three of them were on the open ramp in front of the door; he had them lie down and steady their guns. ‘In case of doubt—shoot,’ he instructed them. ‘Come on, the rest of you.’

Jim was included in the last order. MacRae walked up to the outer door and tried it; it was locked. He pressed the signal switch and waited.

Nothing happened. MacRae pressed the switch again and called out mildly to the speaker grille, ‘Let me in. I have an important message for the Resident.’

Still nothing happened. MacRae changed his tone to pretended exasperation. ‘Hurry up, please! I'm freezing to death out here.’

The door remained dark and silent. MacRae changed his manner to belligerence. ‘Okay, Beecher, open up! We've got the place surrounded and we're ready to blast in the door. You have thirty seconds till we set off the charge.’

The seconds ticked away. Doc muttered to Jim, ‘I wish it were the truth,’ then raised his voice and said, ‘Time's up, Beecher. This is it.’

The door hissed as the compressed air in the lock began to escape to the outside; the lock was starting to cycle. MacRae motioned them back a little; they waited, not breathing, all guns drawn and aimed at the point where the door would begin to open.

Then it was open and a single figure stood in it, the lock's light shining behind him. ‘Don't shoot!’ said a firm, pleasant voice. ‘It's all right. It's all over.’

MacRae peered at the figure. ‘Why, Doctor Rawlings!’ he said. ‘Bless your ugly face.’

13
'It's An Ultimatum'

Rawlings himself had spent half the night locked up, along with half a dozen other prominent citizens who had attempted to reason with Beecher. As the story got around, especially the matter of the deaths of the Pottles, Beecher found himself with no support at all, save from his own clique of sycophants and toadies and the professional, largely disinterested support of the Company's police.

Even Kruger cracked up under the strain, tried to get Beecher to reverse himself—and was stuffed in with the others, which by then included the chief engineer of the power plant. But it was Doctor Rawlings who talked the guard placed over them into risking his job and letting them go—the doctor was treating the guard's wife.

'I don't think Beecher would ever stand trial, even if we had him back on Earth,’ MacRae remarked about the matter to Rawlings and Marlowe. ‘What do you think, Doctor?’ The three were seated in the outer offices of the planet office building. Marlowe had come there after getting word at the power house from MacRae and had gotten busy at once, writing despatches to the Project camps and the other outlying activities, including North Colony itself, trying to round up boats. He had then tried, red-eyed and uncertain from lack of sleep, to compose a suitable report to Earth, until MacRae had interrupted him and insisted that he get some rest first.

'Paranoia?’ said Rawlings.

'A clear case.’

'My opinion, too. I've seen suggestive indications of it, but the case was not fully developed until his will was crossed. He must be hospitalized—and restrained.’ Doctor Rawlings glanced over his shoulder at a closed door. Behind it was Beecher.

Rawlings turned back. ‘What do you think of Howe, Doctor?’

MacRae grunted. ‘Haven't seen enough of him to have an opinion. What do you plan to do with him, Jim?’ he added, turning to Marlowe.

Marlowe frowned. ‘Nothing. The only charges we can make stick aren't worth the trouble. We'll simply ship him back.’

MacRae nodded. ‘That's the ticket. Hanging's too good for him; kick him out.’

'What worries me more,’ Marlowe went on, ‘is whom to get to replace him. The school has to be running again before we leave for Copais. Why don't you volunteer to fill in, Doc? Temporarily, of course.’

MacRae stared. ‘Me? Heaven forbid!’

'Well, I've got to have somebody to ride herd on those youngsters, somebody who can do it without using a straitjacket. They all like you.’

'No—repeat—emphatically—no!’

'There is a young fellow already with the school,’ volunteered Rawlings, ‘whom Professor Steuben was grooming for the job when the Company sent Howe instead. Chap named van der Linden. Seems a good, sensible sort. My boy likes him.’

Marlowe looked interested. ‘I ran into him. He was helpful. Of course I don't have any real authority to appoint him.’

MacRae snorted. ‘Jamie, you'll be the death of me!’

Marlowe put down his coffee cup and wiped his mouth. ‘All that is as may be. I think I'll stretch out on one of these desks for a couple of hours. Doc, will you see that someone wakes me?’

'Certainly,’ agreed MacRae, having no intention of allowing the man to be disturbed until he was fully rested. ‘Don't worry.’

Jim and the others were back at the school where they were to remain until boats could be gotten to take them to Copais. Mrs Palmer was bustling around with her assistants, getting a mammoth breakfast for weary men and boys. Jim himself was dead tired and hungry but much too excited to think about sleeping, even though dawn had broken outside.

He had just received a cup of coffee and was blowing on it when Smythe showed up. ‘Say, I understand you really did kill that cop that took a pot shot at me.’

'No,’ Jim denied, ‘he's in the infirmary now, just wounded. I've seen him.’

Smythe looked troubled. ‘Oh, shucks,’ he said finally, ‘it won't happen more than once in a lifetime. Here's your IOU.’

Jim stared at him. ‘Smitty, you're sick.’

'Probably. Better take it.’

Jim reached back into his subconscious memory and quoted his father. ‘No, thanks, Marlowes pay their debts.’

Smythe looked at him, then said, ‘Oh, the heck with you, you ungracious twerp!’ He tore the IOU into small pieces and stalked away.

Jim looked wonderingly after him. ‘Now what was he sore about?’

He decided to look up Frank and tell him about it.

He found Frank but had no time to tell him about it; a shout came through the crowd: ‘Marlowe! Jim Marlowe!’

'Captain Marlowe's at the planet office,’ someone answered.

'Not him, the kid,’ the first voice replied. ‘Jimmy Marlowe! You're wanted up front, right away.’

'Coming,’ yelled Jim. ‘What for?’ He pushed his way toward the entrance, Frank behind him.

The man who had paged him let him get close before he answered, ‘You won't believe it—I don't myself. Martians.’

Jim and Frank hurried outside. Gathered in front of the school door were more than a dozen Martians. Gekko was there, and G'kuro, but not K'boomch. Nor could Jim make out the old one whom he thought of as ‘head man’ of Gekko's tribe. Gekko spotted them and said in his own speech, ‘Greetings, Jim-Marlowe, greetings, Frank-Sutton, friends sealed with water.’

Another voice called out from one of Gekko's palm flaps, ‘Hi, Jim boy!’ Willis had come home with the bacon, a little late perhaps, but successfully.

Another voice boomed mellowly. Gekko listened, then said, ‘Where is he who stole our little one?’

Jim, uncertain of the dominant tongue, at best, was not sure that he had understood. ‘Huh?’

'He wants to know where Howe is,’ said Frank and answered in fluent, fairly accurate Martian. Howe was still where he had taken refuge, still afraid to face Kelly, despite repeated invitations.

Gekko indicated that he would come into the building. Amazed, but cooperative, the boys led him in. Gekko was forced to fold himself into a shape resembling a hat rack to get into the lock but he managed it; the lock was large. Inside, the sensation caused by his appearance was like that which might have resulted from introducing an elephant into a church. People gave way before him.

The door to the outer office was even more of a squeeze than the air lock, but Gekko made it, with Jim and Frank trailing him. Gekko handed Willis to Jim, then gently explored the handle of the door to Howe's office with a hand flap. Suddenly he pulled and the door came away, not only the lock broken but the door wrenched completely off its hinges. He squatted down further, completely filling the door frame.

The boys looked at each other; Willis closed up. They heard Howe saying ‘What's the meaning of this? Who are —’

Then Gekko stood up as well as he could in a room intended for humans and started for the outer door. The boys hesitated; Frank said, ‘Let's see what he did to him.’ He stepped to the wrecked door and looked in. ‘I don't see him. Hey, Jim—he's not in here at all.’

Nor was he.

They hurried after Gekko and reached him at the air lock. No one stopped Gekko; no one stopped them. The repeated indoctrination concerning Martians swept a path before them. Outside Gekko turned to them. ‘Where is the other one, who would do harm to the little one?’

Frank explained that Beecher was some distance away and not available. ‘You will show us,’ announced Gekko and picked them both up. Another Martian relieved him of Frank.

Jim felt himself cradled in the soft palm flaps, even as Willis was still cradled in Jim's arms. Willis extended his eyes, looked around and remarked, ‘Fine ride, huh?’ Jim was not sure.

The Martians ambled through town at an easy eight miles an hour, over the bridge, and to the planet offices. The pressure lock there was higher and larger than that at the school; the entire party went inside. The ceiling of the building's foyer was quite high enough for even the tallest Martian. Once they were inside Gekko set Jim down, as did the Martian carrying Frank.

There had been the same scurrying surprise as at the school. MacRae came out and looked the situation over without excitement. ‘What's all this jamboree?’ he asked.

'They want to talk to Beecher,’ Frank explained.

MacRae raised his eyebrows, then spoke in clear Martian. One of them answered him; they conversed back and forth. ‘Okay, I'll get him,’ agreed MacRae, then repeated it in Martian. He went into the offices. He returned in a few minutes, pushing Beecher in front of him, and followed by Rawlings and Marlowe. ‘Some people to see you,’ MacRae said and gave Beecher a shove that carried him out onto the floor of the foyer.

'This is the one?’ inquired the Martian spokesman.

'This is verily the one.’

Beecher looked up at them. ‘What do you want me for?’ he said in Basic. The Martians moved so that they were on all sides of him. ‘Now you get away from me!’ he said. They moved in slowly, tightening the circle. Beecher attempted to break out of it; a great hand flap was placed in his way.

They closed in further. Beecher darted this way and that, then he was concealed completely from the spectators by a screen of palm flaps. ‘Let me out!’ he was heard to shout. ‘I didn't do anything. You've got no right to —’ His voice stopped in a scream.

The circle relaxed and broke up. There was no one inside it, not even a spot of blood on the floor.

The Martians headed for the door. Gekko stopped and said to Jim, ‘Would you return with us, my friend?’

'No—oh, no,’ said Jim. ‘I have to stay here,’ then remembered to translate.

'And the little one?’

'Willis stays with me. That's right, isn't it, Willis?’

'Sure, Jim boy.’

'Then tell Gekko so.’ Willis complied. Gekko said farewell sadly to the boys and to Willis and went on out the lock.

MacRae and Rawlings were in whispered, worried conference at the spot where Beecher had last been seen; Captain Marlowe was looking sleepy and confused and listening to them. Frank said, ‘Let's get out of here, Jim.’

'Right.’

The Martians were still outside. Gekko saw them as they came out, spoke to one of his kind, then said, ‘Where is the learned one who speaks our speech? We would talk with him.’

'I guess they want Doc,’ said Frank.

'Is that what he meant?’

'I think so. We'll call him.’ They went back inside and dug MacRae out of a cluster of excited humans. ‘Doc,’ said Frank, ‘they want to talk with you—the Martians.’

'Eh?’ said MacRae. ‘Why me?’

'I don't know.’

The doctor turned to Marlowe. ‘How about it, Skipper? Do you want to sit in on this?’

Mr Marlowe rubbed his forehead. ‘No, I'm too confused to try to handle the language. You take it.’

'Okay.’ MacRae went for his suit and mask, let the boys help dress him, and then did not deny them when they tagged along. However, once outside, they held back and watched from a distance.

MacRae walked down to the group standing on the ramp and addressed them. Voices boomed back at him. He entered the group and the boys could see him talking, answering, gesticulating with his hands. The conference continued quite a long time.

Finally MacRae dropped his arms to his sides and looked tired. Martian voices boomed in what was plainly farewell, then the whole party set out at a rapid, leisurely pace for the bridge and their own city. MacRae plodded back up the ramp.

In the lock Jim demanded, ‘What was it all about, Doc?’

'Eh? Hold your peace, son.’

Inside MacRae took Marlowe's arm and led him toward the office they had preempted. ‘You, too, Rawlings. The rest of you get about your business.’ Nevertheless the boys tagged along and MacRae let them come in. ‘You might as well hear it; you're in it up to your ears.

Mind that door, Jim. Don't let anyone open it.’

'Now what is it?’ asked Jim's father. ‘What are you looking so grim about?’

'They want us to leave.’

'Leave?’

'Get off Mars, go away, go back to Earth.’

'What? Why do they suggest that?’

'It's not a suggestion; it's an order, an ultimatum. They aren't even anxious to give us time enough to get ships here from Earth. They want us to leave, every man jack, woman, and child; they want us to leave right away—and they aren't fooling!’

14
Willis

Four days later doctor MacRae stumbled into the same office. Marlowe still looked tired, but this time it was MacRae who looked exhausted. ‘Get these other people out of here, Skipper.’

Marlowe dismissed them and closed the door. ‘Well?’

'You got my message?’

'Yes.’

'Is the Proclamation of Autonomy written? Did the folks go for it?’

'Yes, it's written—we cribbed a good deal from the American Declaration of Independence I'm afraid, but we wrote one.’

'I'm not interested in the rhetoric of the thing! How about it?’

'It's ratified. Easily enough here. We had quite a few startled queries from the Project camps, but it was accepted. I guess we owe Beecher a vote of thanks on that; he made independence seem like a fine idea.’

'We owe Beecher nothing! He nearly got us all killed.’

'Just how do you mean that?’

'I'll tell you—but I want to know about the Declaration. I had to make some promises. It's gone off?’

'Radioed to Chicago last night. Too soon to expect an answer. But let me ask the questions: were you successful?’

'Yes.’ MacRae rubbed his eyes wearily. ‘We can stay. It was a great fight, Maw, but I won. They'll let us stay.’

Marlowe got up and started to set up a wire recorder. ‘Do you want to talk it into the record and save having to go over it again?’

MacRae waved it away. ‘No. Whatever formal report I make will have to be very carefully edited. I'll try to tell you about it first.’ He paused and looked thoughtful. ‘Jamie, how long has it been since men first landed on Mars? More than fifty Earth years, isn't it? I believe I have learned more about Martians in the past few hours than was learned in all that time. And yet I don't know anything about them. We kept trying to think of them as human, trying to force them into our moulds. But they aren't human; they aren't anything like us at all.'

He added, 'They had interplanetary flight millions of years back ... had it and gave it up.'

'What?' said Marlowe.

'It doesn't matter. It's not important. It's just one of the things I happened to find out while I was talking with the old one, the same old one with whom Jim talked. By the way, Jim was seeing things; he's not a Martian at all.'

'Wait a minute—what is he, then?'

'Oh, I guess he's a native of Mars all right, but he isn't what you and I mean by a Martian. At least he didn't look like one to me.'

'What did he look like? Describe him.'

MacRae looked puzzled. 'Uh, I *can't.* Maybe Jim and I each saw what he wanted us to see. Never mind. Willis has to go back to the Martians and rather soon.'

'I'm sorry,' Marlowe answered. 'Jim won't like that, but it's not a high price to pay if it pleases them.'

'You don't understand, you don't understand at all. Willis is the key to the whole thing.'

'Certainly he's been mixed up in it,' agreed Marlowe, 'but why the key?'

MacRae rubbed his temples. 'It's very complicated and I don't know where to start. Willis *is* important. Look, Jamie, you'll go down in history as the father of your country, no doubt, but, between ourselves, Jim should be credited for being the saviour of it. It was directly due to Jim and Willis—Willis's love for Jim and Jim's staunch befriending of him—that the colonists are alive today instead of pushing up daisies. The ultimatum to get off this globe represented a concession made to Jim; they had intended to exterminate us.'

Marlowe's mouth dropped open. 'But that's impossible! Martians wouldn't do anything like that!'

'Could and would,' MacRae stated flatly. 'They've been having doubts about us for a long time. Beecher's notion of shipping Willis off to a zoo pushed them over the edge—but Jim's relationship to Willis pulled them back again. They compromised.'

'I can't believe that they would,' protested Marlowe, 'nor can I see how they could.'

'Where's Beecher?' MacRae said bluntly.

'Mmm ... yes.'

'So don't talk about what they can or can't do. We don't know anything about them ... not anything.'

'I can't argue with you. But can you clear up some of this mystery about Jim and Willis? Why do they care? After all, Willis is just a bouncer.'

'I don't think I can clear it up,' MacRae admitted, 'but I can sure lace it around with some theories. Do you know Willis's Martian name? Do you know what it means?'

'I didn't know he had one —'

'It reads: In whom the hopes of a world are joined. That suggest anything to you?'

'Gracious, no!'

'I may have translated it badly. Maybe it means Young Hopeful, or merely Hope. Maybe Martians go in for poetical meanings, like we do. Take my name, Donald. Means World Ruler. My parents sure muffed that one. Or maybe Martians enjoy giving bouncers fancy names. I once knew a Pekinese called, believe it or not, Grand Champion Manchu Prince of Belvedere.' MacRae looked suddenly startled. 'Do you know, I just remembered that dog's family-and-fireside name was Willis!'

'You don't say!'

'I do say.' The doctor scratched the stubble on his chin and reflected that he should shave one of these weeks. 'But it's not even a coincidence. I suggested the name Willis to Jim in the first place; I was probably thinking of the Peke. Engaging little devil, with a pop-eyed way of looking at you just like Willis—our Willis. Which is to say that neither one of Willis's names necessarily means anything.'

He sat so long without saying anything that Marlowe said, 'You aren't clearing up the mystery very fast. You think that Willis's real name does mean something, don't you?—else you wouldn't have brought it up.'

MacRae sat up with a jerk. 'I do. I do indeed. I think Willis's name is meant literally. Now wait a minute—don't throw anything. I won't get violent. What do you think Willis is?'

'Me?' said Marlowe. 'I think he's an example of exotic Martian *fauna,* semi-intelligent and adapted to his environment.'

'Big words,' complained the doctor. '*I* think he is what a Martian is before he grows up.'

Marlowe looked pained. 'There is no similarity of structure. They're as different as chalk and cheese.'

'Granted. What's the similarity between a caterpillar and a butterfly?'

Marlowe opened his mouth and closed it. 'I don't blame you,' MacRae went on, 'we never think of such metamorphosis in connection with higher types, whatever a higher type is. But I think that is what Willis is and it appears to be why Willis has to go back to his people soon. He's in the nymph stage; he's about to go into a pupal stage—some sort of a long hibernation. When he comes out he'll be a Martian.’

Marlowe chewed his lip. ‘There's nothing unreasonable about it—just startling.’

'Everything about Mars is startling. But if my theory is correct—and mind you, I'm not saying it is—then it might explain *why* Willis is such an important personage. Eh?’

Marlowe said wearily, ‘You ask me to assimilate too much at once.’

'Emulate the Red Queen. I'm not through. I think the Martians have still another stage, the stage of the old one to whom I talked—and I think it's the strangest one of all. Jamie, can you imagine a people having close and everyday relations with Heaven—*their* heaven—as close and matter of fact as the relations between, say, the United States and Canada?’

'Doc, I'll imagine anything you tell me to.’

'We speak of the Martian other world; what does it mean to you?’

'Nothing. Some sort of a trance, such as the East Indians indulge in.’

'I ask you because I talked, so they told me, to someone in the other world—the old one I mean. Jamie, I think I negotiated our new colonizing treaty with a *ghost.'*

'Now just keep your seat,’ MacRae went on. ‘I'll tell you why. I was getting nowhere with him so I changed the subject. We were talking Basic, by the way; he had picked Jim's brains. He knew every word that Jim might know and none that Jim couldn't be expected to know. I asked him to assume, for the sake of argument, that we were to be allowed to stay—in which case, would the Martians let us use their subway system to get to Copais? I rode one of those subways to the conference. Very clever—the acceleration is always *down,* as if the room were mounted on gymbals. The old one had trouble understanding what I wanted. Then he showed me a globe of Mars—very natural, except that it had no canals. Gekko was with me, just as he was with Jim. The old one and Gekko had a discussion, the gist of which was *what year was I at?* Then the globe changed before my eyes, bit by bit. I saw the canals crawl across the face of Mars. *I saw them being built,* Jamie.

'Now I ask you,’ he concluded, ‘what kind of a being is it that has trouble remembering which millennium he is in? Do you mind if I tag him a ghost?’

'I don't mind anything,’ Marlowe assured him. ‘Maybe we're all ghosts.’

'I've given you one theory, Jamie; here is another: bouncers and Martians and Old Ones are entirely separate races. Bouncers are third class citizens, Martians are second class citizens, and the real owners we never see, because they live down underneath. They don't care what we do with the surface as long as we behave ourselves. We can use the park, we can even walk on the grass, but we mustn't frighten the birds. Or maybe the old one was just hypnosis that Gekko used on me, maybe it's bouncers and Martians only. You name it.’

'I can't,’ said Marlowe. ‘I'm satisfied that you managed to negotiate an agreement that permits us to stay on Mars. I suppose it will be years before we understand the Martians.’

'You are putting it mildly, Jamie. The white man was still studying the American Indian, trying to find out what makes him tick, five hundred years after Columbus—and the Indian and the European are both *men,* like as two peas. These are *Martians.* We'll never understand them; we aren't even headed in the same direction.’

MacRae stood up. ‘I want to get a bath and some sleep ... after I see Jim.’

'Just a minute. Doc, do you think we'll have any real trouble making this autonomy declaration stick?’

'It's got to stick. Relations with the Martians are eight times as delicate as we thought they were; absentee ownership isn't practical. Imagine trying to settle issues like this one by taking a vote back on Earth among board members that have never even *seen* a Martian.’

'That's not what I mean. How much opposition will we run into?’

MacRae scratched his chin again. ‘Men have had to fight for their liberties before, Jamie. I don't know. It's up to us to convince the folks back on Earth that autonomy is necessary. With the food and population problem back on Earth being what it is, they'll do anything necessary—once they realize what we're up against—to keep the peace and continue migration. They don't want anything to hold up the Project.’

'I hope you're right.’

'In the long run I have to be right. We've got the Martians pitching on our team. Well, I'm on my way to break the news to Jim.’

'He's not going to like it,’ said Jim's father.

'He'll get over it. Probably he'll find another bouncer and teach him English and call him Willis, too. Then he'll grow up and not make pets of bouncers. It won't matter.’ He looked thoughtful, and added, ‘But what becomes of Willis? I wish I knew.’

Farmer in the Sky

1. Earth

Our troop had been up in the High Sierras that day and we were late getting back. We had taken off from the camp field on time but Traffic Control swung us 'way east to avoid some weather. I didn't like it; Dad usually won't eat if I'm not home.

Besides that, I had had a new boy shoved off on me as copilot; my usual copilot and assistant patrol leader was sick, so our Scoutmaster, Mr. Kinski, gave me this twerp. Mr. Kinski rode in the other copter with the Cougar Patrol.

"Why don't you put on some speed?" the twerp wanted to know.

"Ever hear of traffic regulations?" I asked him.

The copter was on slave-automatic, controlled from the ground, and was cruising slowly, down a freight lane they had stuck us in.

The twerp laughed. "You can always have an emergency. Here—I'll show you." He switched on the mike. "Dog Fox Eight Three, calling traffic—"

I switched it off, then switched on again when Traffic answered and told them that we had called by mistake. The twerp looked disgusted. "Mother's good little boy!" he said in sticky sweet tones.

That was just the wrong thing to say to me. "Go aft," I told him, "and tell Slats Keifer to come up here."

"Why? He's not a pilot."

"Neither are you, for my money. But he weighs what you do and I want to keep the crate trimmed."

He settled back in his seat. "Old Man Kinski assigned me as copilot; here I stay."

I counted to ten and let it ride. The pilot compartment of a ship in the air is no place for a fight. We had nothing more to say to each other until I put her down on North Diego Platform and cut the tip jets.

I was last one out, of course. Mr, Kinski was waiting there for us but I didn't see him; all I saw was the twerp. I grabbed him by the shoulder. "Want to repeat that crack now?" I asked him.

Mr. Kinski popped up out of nowhere, stepped between us and said, "Bill! Bill! What's the meaning of this?"

"I—" I started to say that I was going to slap the twerp loose from his teeth, but I thought better of it

Mr. Kinski turned to the twerp. "What happened, Jones?"

"I didn't do anything! Ask anybody."

I was about to say that he could tell that to the Pilots' Board. Insubordination in the air is a serious matter. But that "Ask anybody" stopped me. Nobody else had seen or heard anything.

Mr. Kinski looked at each of us, then said, "Muster your patrol and dismiss them, Bill." So I did and went on home.

All in all, I was tired and jumpy by the time I got home. I had listened to the news on the way home; it wasn't good. The ration had been cut another ten calories—which made me still hungrier and reminded me that I hadn't been home to get Dad's supper. The newscaster went on to say that the Spaceship *Mayflower* had finally been commissioned and that the rolls were now opened for emigrants. Pretty lucky for them, I thought. No short rations. No twerps like Jones.

And a brand new planet.

George—my father, that is—was sitting in the apartment, looking over some papers. "Howdy, George," I said to him, "eaten yet?"

"Hello, Bill. No."

"I'll have supper ready right away." I went into the pantry and could see that he hadn't eaten lunch, either. I decided to fix him a plus meal.

I grabbed two Syntho-Steaks out of the freezer and slapped them in quickthaw, added a big Idaho baked potato for Dad and a smaller one for me, then dug out a package of salad and let it warm naturally.

By the time I had poured boiling water over two soup cubes and over coffee powder the steaks were ready for the broiler. I transferred them, letting it cycle at medium rare, and stepped up the gain on the quickthaw so that the spuds would be ready when the steaks were—then back to the freezer for a couple of icekreem cake slices for dessert.

The spuds were ready. I took a quick look at my ration accounts, decided we could afford it, and set out a couple of pats of butterine for them. The broiler was ringing; I removed the steaks, set everything out, and switched on the candles, just as Anne would have done.

"Come and get it!" I yelled and turned back to enter the calorie and point score on each item from the wrappers, then shoved the wrappers in the incinerator. That way you never get your accounts fouled up.

Dad sat down as I finished. Elapsed time from scratch, two minutes and twenty seconds—there's nothing hard about cooking; I don't see why women make such a fuss about it. No system, probably.

Dad sniffed the steaks and grinned. "Oh boy! Bill, you'll bankrupt us."

"You let me worry," I said. I'n still plus for this quarter." Then I frowned. "But I won't be, next quarter, unless they quit cutting the ration."

Dad stopped with a piece of steak on its way to his mouth. "Again?"

"Again. Look, George, I don't get it. This was a good crop year and they started operating the Montana yeast plant besides."

"You follow all the commissary news, don't you, Bill?"

"Naturally."

"Did you notice the results of the Chinese census as well? Try it on your slide rule."

I knew what he meant—and the steak suddenly tasted like old rubber. What's the use in being careful if somebody on the other side of the globe is going to spoil your try? "Those darned Chinese ought to quit raising babies and start raising food!"

"Share and share alike, Bill."

"But—" I shut up. George was right, he usually is, but somehow it didn't seem fair. "Did you hear about the *Mayflower*?" I asked to change the subject.

"What about the *Mayflower*?" Dad's voice was suddenly cautious, which surprised me. Since Anne died —Anne was my mother—George and I have been about as close as two people can be.

"Why, she was commissioned, that's all. They've started picking emigrants."

"So?" There was that cautious tone again. "What did you do today?"

"Nothing much. We hiked about five miles north of camp and Mr. Kinski put some of the kids through tests. I saw a mountain lion."

"Really? I thought they were all gone."

"Well, I thought I saw one."

"Then you probably did. What else?"

I hesitated, then told him about this twerp Jones. "He's not even a member of our troop. How does he get that way, interfering with my piloting?"

"You did right, Bill. Sounds as if this twerp Jones, as you call him, was too young to be trusted with a pilot's license."

"Matter of fact, he's a year older than I am."

"In my day you had to be sixteen before you could even go up for your license."

"Times change, George."

"So they do. So they do."

Dad suddenly looked sad and I knew he was thinking about Anne. I hastily said, "Old enough or not, how does an insect like Jones get by the temperament-stability test?"

"Psycho tests aren't perfect, Bill. Neither are people." Dad sat back and lit his pipe. "Want me to clean up tonight?"

"No, thanks." He always asked; I always turned him down. Dad is absentminded; he lets ration points get into the incinerator. When I salvage, I really salvage. "Feel like a game of cribbage?"

"I'll beat the pants off you."

"You and who else?" I salvaged the garbage, burned the dishes, followed him into the living room. He was getting out the board and cards.

His mind wasn't really on the game. I was around the corner and ready to peg out before he was really under way. Finally he put down his cards and looked square at me. "Son—"

"Huh? I mean, 'Yes, George?'"

"I've decided to emigrate in the *Mayflower*."

I knocked over the cribbage board. I picked it up, eased my throttle, and tried to fly right. "That's swell! When do we leave?"

Dad puffed furiously on his pipe. "That's the point, Bill. You're not going."

I couldn't say anything. Dad had never done anything like this to me before. I sat there, working my mouth like a fish. Finally I managed, "Dad, you're joking."

"No, I'm not, Son."

"But why? Answer me that one question: why?"

"Now see here, Son—"

"Call me 'Bill'."

"Okay, Bill. It's one thing for me to decide to take my chances with colonial life but I've got no right to get you off to a bad start. You've got to finish your education. There are no decent schools on Ganymede. You get your education, then when you're grown, if you want to emigrate, that's your business."

"That's the reason? That's the only reason? To go to school?"

"Yes. You stay here and take your degree. I'd like to see you take your doctor's degree as well. Then, if you want to, you can join me. You won't have missed your chance; applicants with close relatives there have priority."

"No!"

Dad looked stubborn.

So did I, I guess. "George, I'm telling you, if you leave me behind, it won't do any good. I won't go to school. I can pass the exams for third class citizenship right now. Then I can get a work permit and—"

He cut me short. "You won't need a work permit. I'm leaving you well provided for, Bill. You'll—"

" 'Well provided for'! Do you think I'd touch a credit of yours if you go away and leave me? I'll live on my student's allowance until I pass the exams and get my work card."

"Bring your voice down, Sonl" He went on, "You're proud of being a Scout, aren't you?"

"Well--yes."

"I seem to remember that Scouts are supposed to be obedient. And courteous, too."

That one was pretty hot over the plate. I had to think about it. "George——"

"Yes, Bill?"

"If I was rude, I'm sorry. But the Scout Law wasn't thought up to make it easy to push a Scout around. As long as I'm living in your home I'll do what you say. But if you walk out on me, you don't have any more claim on me. Isn't that fair?"

"Be reasonable, Son. I'm doing it for your own good."

"Don't change the subject, George. Is that fair or isn't it? If you go hundreds of millions of miles away, how can you expect to run my life after you're gone? I'll be on my own."

"I'll still be your father."

"Fathers and sons should stick together. As I recall, the fathers that came over in the original *Mayflower* brought their kids with them."

"This is different."

"How?"

"It's further, incredibly further—and dangerous."

"So was that move dangerous—half the Plymouth Rock colony died the first winter; everybody knows that. And distance doesn't mean anything; what matters is how long it takes. If I had had to walk back this afternoon, I'd still be hiking next month. It took the Pilgrims sixty-three days to cross the Atlantic or so they taught me in school, but this afternoon the caster said that the *Mayflower* will reach Ganymede in sixty days. That makes Ganymede closer than London was to Plymouth Rock."

Dad stood up and knocked out his pipe. "I'm not going to argue, Son."

"And I'm not, either." I took a deep breath. I shouldn't have said the next thing I did say, but I was mad. I'd never been treated this way before and I guess I wanted to hurt back. "But I can tell you this: you're not the only one who is sick of short rations. If you think I'm going to stay here while you're eating high on the hog out in the colonies, then you had better think about it again. I thought we were partners."

That last was the meanest part of it and I should have been ashamed. That was what he had said to me the day after Anne died, and that was the way it had always been.

The minute I said it I knew why George had to emigrate and I knew it didn't have anything to do with ration points. But I didn't know how to unsay it.

Dad stared. Then he said slowly, "You think that's how it is? That I want to go away so I can quit skipping lunch to save ration points?"

"What else?" I answered. I was stuck in a groove; I didn't know what to say.

"Hmm... well, if you believe that, Bill, there is nothing I can say. I think I'll turn in."

I went to my room, feeling all mixed up inside. I wanted Mother around so bad I could taste it and I knew that George felt the same way. She would never have let us reach the point where we were actually shouting at each other—at least I had shouted. Besides that, the partnership was busted up, it would never be the same.

I felt better after a shower and a long massage. I knew that the partnership couldn't really be busted up. In the long run, when George saw that I had to go, he wouldn't let college stand in the way. I was sure of that—well, pretty sure at least.

I began to think about Ganymede.

Ganymede!

Why, I had never even been out to the Moon!

There was a boy in my class who had been born on the Moon. His parents were still there; he had been sent home for schooling. He gave himself airs as a deepspace man. But Luna was less than a quarter of a million miles away; you could practically throw rocks at it. It wasn't self-supporting; Moon Colony had the same rations as Earth. It was really part of Earth. But Ganymede!

Let's see—Jupiter was half a billion miles away, more or less, depending on the time of year. What was the tiny distance to the Moon compared with a jump like that?

Suddenly I couldn't remember whether Ganymede was Jupiter's third moon or fourth. And I just had to know. There was a book out in the living room that would tell and more besides—Ellsworth Smith's A Tour of Earth's Colonies. I went out to get it.

Dad hadn't gone to bed. He was sitting up, reading. I said, "Oh—hello," and went to look for the book. He nodded and went on reading.

The book wasn't where it should have been. I looked around and Dad said, "What are you looking for, Bill?"

Then I saw that he was reading it. I said, "Oh, nothing. I didn't know you were using it."

"This?" He held it up.

"It doesn't matter. I'll find something else."

"Take it. I'm through with it."

"Well ... All right-thanks." I took it and turned away.

"Just a minute, Bill."

I waited. "I've come to a decision, Bill. I'm not going."

"Huh?"

"You were right about us being partners. My place is here."

"Yes, but— Look, George, I'm sorry I said what I did about rations. I know that's not the reason. The reason is—well, you've got to go." I wanted to tell him I knew the reason was Anne, but if I said Anne's name out loud I was afraid I'd bawl.

"You mean that you are willing to stay behind—and go to school?"

"Uh—" I wasn't quite ready to say that; I was dead set on going myself. "I didn't quite mean that. I meant that I know why you want to go, why you've got to go."

"Hmm…" He lit his pipe, making a long business of it. "I see. Or maybe I don't" Then he added, "Let's put it this way, Bill. The partnership stands. Either we both go, or we both stay—unless you decide of your own volition that you will stay to get your degree and join me out there later. Is that fair?"

"Huh? Oh, yes!"

"So let's talk about it later."

I said goodnight and ducked into my room quick. William, my boy, I told myself, it's practically in the bag—if you can just keep from getting soft-hearted and agreeing to a split up. I crawled into bed and opened the book.

Ganymede was Jupiter-III; I should have remembered that. It was bigger than Mercury, much bigger than the Moon, a respectable planet, even if it was a moon. The surface gravity was one third of Earth-normal; I would weigh about fortyfive pounds there. First contacted in 1985—which I knew—and its atmosphere project started in 1998 and had been running ever since.

There was a stereo in the book of Jupiter as seen from Ganymede —round as an apple, ruddy orange, and squashed on both poles. And big as all outdoors. Beautiful. I fell asleep staring at it.

Dad and I didn't get a chance to talk for the next three days as my geography class spent that time in Antarctica. I came back with a frostbitten nose and some swell pix of penguins—and some revised ideas. I had had time to think.

Dad had fouled up the account book as usual but he had remembered to save the wrappers and it didn't take me long to straighten things out. After dinner I let him beat me two games, then said, "Look, George——"

"Yes?"

"You know what we were talking about?"

"Well, yes."

"It's this way. I'm under age; I can't go if you won't let me. Seems to me you ought to, but if you don't, I won't quit school. In any case, you ought to go—you need to go—you know why. I'm asking you to think it over and take me along, but I'm not going to be a baby about it."

Dad almost looked embarrassed. "That's quite a speech, Son. You mean you're willing to let me go, you stay here and go to school, and not make a fuss about it?"

"Well, not 'willing'-but I'd put up with it."

"Thanks." Dad fumbled in his pouch and pulled out a flat photo. "Take a look at this."

"What is it?"

"Your file copy of your application for emigration. I submitted it two days ago."

2. The Green-Eyed Monster

I wasn't much good in school for the next few days. Dad cautioned me not to get worked up over it; they hadn't approved our applications as yet. "You know, Bill, ten times as many people apply as can possibly go."

"But most of them want to go to Venus or Mars. Ganymede is too far away; that scares the sissies out."

"I wasn't talking about applications for all the colonies; I meant applications for Ganymede, specifically for this first trip of the *Mayflower*."

"Even so, you can't scare me. Only about one in ten can qualify. That's the way it's always been."

Dad agreed. He said that this was the first time in history that some effort was being made to select the best stock for colonization instead of using colonies as dumping grounds for misfits and criminals and failures. Then he added, "But look, Bill, what gives you the notion that you and I can necessarily qualify? Neither one of us is a superman,"

That rocked me back on my heels. The idea that we might not be good enough hadn't occurred to me. "George, they couldn't turn us down!"

"They could and they might."

"But how? They need engineers out there and you're tops. Me—I'm not a genius but I do all right in school. We're both healthy and we don't have any bad mutations; we aren't color blind or bleeders or anything like that."

"No bad mutations that we know of," Dad answered. "However, I agree that we seem to have done a fair job in picking our grandparents. I wasn't thinking of anything as obvious as that."

"Well, what, then? What could they possibly get us on?"

He fiddled with his pipe the way he always does when he doesn't want to answer right away. "Bill, when I pick a steel alloy for a job, it's not enough to say, 'Well, it's a nice shiny piece of metal; let's use it.' No, I take into account a list of tests as long as your arm that tells me all about that alloy, what it's good for and just what I can expect it to do in the particular circumstances I intend to use it. Now if you had to pick people for a tough job of colonizing, what would you look for?"

"Uh ... I don't know."

"Neither do I. I'm not a social psychometrician. But to say that they want healthy people with fair educations is like saying that I want steel rather than wood for a job. It doesn't tell what sort of steel. Or it might not be steel that was needed; it might be titanium alloy. So don't get your hopes too high."

"But—well, look, what can we do about it?"

"Nothing. If we don't get picked, then tell yourself that you are a darn good grade of steel and that it's no fault of yours that they wanted magnesium."

It was all very well to look at it that way, but it worried me. I didn't let it show at school, though. I had already let everybody know that we had put in for Ganymede; if we missed—well, it would be sort of embarrassing.

My best friend, Duck Miller, was all excited about it and was determined to go, too.

"But how can you?" I asked. "Do your folks want to go?"

"I already looked into that," Duck answered. "All I have to have is a grown person as a sponsor, a guardian. Now if you can tease your old man into signing for me, it's in the bag."

"But what will your father say?"

"He won't care. He's always telling me that when he was my age he was earning his own living. He says a boy should be self reliant. Now how about it? Will you speak to your old man about it—tonight?"

I said I would and I did. Dad didn't say anything for a moment, then he asked: "You really want Duck with you?"

"Sure I do. He's my best friend."

"What does his father say?"

"He hasn't asked him yet," and then I explained how Mr. Miller felt about it

"So?" said Dad. "Then let's wait and see what Mr. Miller says."

"Well—look, George, does that mean that you'll sign for Duck if his father says it's okay?"

"I meant what I said, Bill. Let's wait. The problem may solve itself."

I said, "Oh well, maybe Mr. and Mrs. Miller will decide to put in for it, too, after Duck gets them stirred up."

Dad just cocked an eyebrow at me. "Mr. Miller has, shall we say, numerous business interests here. I think it would be easier to jack up one corner of Boulder Dam than to get him to give them up."

"You're giving up your business."

"Not my business, my professional practice. But I'm not giving up my profession; I'm taking it with me."

I saw Duck at school the next day and asked him what his father had said.

"Forget it," he told me. "The deal is off."

"Huh?"

"My old man says that nobody but an utter idiot would even think of going out to Ganymede. He says that Earth is the only planet in the system fit to live on and that if the government wasn't loaded up with a bunch of starry-eyed dreamers we would quit pouring money down a rat hole trying to turn a bunch of bare rocks in the sky into green pastures. He says the whole enterprise is doomed."

"You didn't think so yesterday."

"That was before I got the straight dope. You know what? My old man is going to take me into partnership. Just as soon as I'm through college he's going to start breaking me into the management end. He says he didn't tell me before because he wanted me to learn self reliance and initiative, but he thought it was time I knew about it. What do you think of that?"

"Why, that's pretty nice, I suppose. But what's this about the 'enterprise being doomed'?"

" 'Nice', he calls it! Well, my old man says that it is an absolute impossibility to keep a permanent colony on Ganymede. It's a perilous toehold, artificially maintained—those were his exact words—and someday the gadgets will bust and the whole colony will be wiped out, every man jack, and then we will quit trying to go against nature."

We didn't talk any more then as we had to go to class. I told Dad about it that night. "What do you think, George?"

"Well, there is something in what he says——"

"Huh?"

"Don't jump the gun. If everything went sour on Ganymede at once and we didn't have the means to fix it, it would revert to the state we found it in. But that's not the whole answer. People have a funny habit of taking as 'natural' whatever they are used to—but there hasn't been any 'natural' environment, the way they mean it, since men climbed down out of trees. Bill, how many people are there in California?"

"Fifty-five, sixty million."

"Did you know that the first four colonies here starved to death? 'S truthl How is it that fifty-odd million can live here and not starve?

Barring short rations, of course."

He answered it himself. "We've got four atomic power plants along the coast just to turn sea water into fresh water. We use every drop of the Colorado River and every foot of snow that falls on the Sierras. And we use a million other gadgets. If those gadgets went bad—say a really big earthquake knocked out all four atomic plants—the country would go back to desert. I doubt if we could evacuate that many people before most of them died from thirst. Yet I don't think Mr. Miller is lying awake nights worrying about it. He regards Southern California as a good 'natural' environment.

"Depend on it, Bill. Wherever Man has mass and energy to work with and enough savvy to know how to manipulate them, he can create any environment he needs."

I didn't see much of Duck after that. About then we got our preliminary notices to take tests for eligibility for the Ganymede colony and that had us pretty busy. Besides, Duck seemed different—or maybe it was me. I had the trip on my mind and he didn't want to talk about it. Or if he did, he'd make some crack that rubbed me the wrong way.

Dad wouldn't let me quit school while it was still uncertain as to whether or not we would qualify, but I was out a lot, taking tests. There was the usual physical examination, of course, with some added wrinkles. A g test, for example—I could take up to eight gravities before I blacked out, the test showed. And a test for low-pressure tolerance and hemorrhaging—they didn't want people who ran to red noses and varicose veins. There were lots more.

But we passed them. Then came the psycho tests which were a lot worse because you never knew what was expected of you and half the time you didn't even know you were being tested. It started off with hypno-analysis, which really puts a fellow at a disadvantage. How do you know what you've blabbed while they've got you asleep?

Once I sat around endlessly waiting for a psychiatrist to get around to seeing me. There were a couple of clerks there; when I came in one of them dug my medical and psycho record out of file and laid it on a desk. Then the other one, a redheaded guy with a permanent sneer, said, "Okay, Shorty, sit down on that bench and wait."

After quite a while the redhead picked up my folder and started to read it. Presently he snickered and turned to the other clerk and said, "Hey, Ned—get a load of this!"

The other one read what he was pointing to and seemed to think it was funny, too. I could see they were watching me and I pretended not to pay any attention.

The second clerk went back to his desk, but presently the redhead went over to him, carrying my folder, and read aloud to him, but in such a low voice that I couldn't catch many of the words. What I did catch made me squirm.

When he had finished the redhead looked right at me and laughed. I stood up and said, "What's so funny?"

He said, "None of your business, Shorty. Sit down."

I walked over and said, "Let me see that."

The second clerk stuffed it into a drawer of his desk. The redhead said, "Mamma's boy wants to see it, Ned. Why don't you give it to him?"

"He doesn't really want to see it," the other one said.

"No, I guess not." The redhead laughed again and added, "And to think he wants to be a big bold colonist."

The other one looked at me while chewing a thumbnail and said, "I don't think that's so funny. They could take him along to cook."

This seemed to convulse the redhead. "Ill bet he looks cute in an apron."

A year earlier I would have poked him, even though he outweighed me and outreached me. That "Mamma's boy" remark made me forget all about wanting to go to Ganymede; I just wanted to wipe the silly smirk off his face.

But I didn't do anything. I don't know why; maybe it was from riding herd on that wild bunch of galoots, the Yucca Patrol—Mr. Kinski says that anybody who can't keep order without using his fists can't be a patrol leader under him.

Anyhow I just walked around the end of the desk and tried to open the drawer. It was locked. I looked at them; they were both grinning, but I wasn't. "I had an appointment for thirteen o'clock," I said. "Since the doctor isn't here, you can tell him I'll phone for another appointment." And I turned on my heel and left

I went home and told George about it. He just said he hoped I hadn't hurt my chances.

I never did get another appointment. You know what? They weren't clerks at all; they were psychometricians and there was a camera and a mike on me the whole time.

Finally George and I got notices saying that we were qualified and had been posted for the *Mayflower*, "subject to compliance with all requirements."

That night I didn't worry about ration points; I really set us out a feast.

There was a booklet of the requirements mentioned. "Satisfy all debts"—that didn't worry me; aside from a half credit I owed Slats Keifer I didn't have any. "Post an appearance bond"—George would take care of that "Conclude any action before any court of superior jurisdiction"—I had never been in court except the Court of Honor.

There were a flock of other things, but George would handle them.

I found some fine print that worried me. "George," I said, "It says here that emigration is limited to families with children."

He looked up. "Well, aren't we such a family? If you don't mind being classified as a child."

"Oh. I suppose so. I thought it meant a married couple and kids."

"Don't give it a thought."

Privately I wondered if Dad knew what he was talking about.

We were busy with innoculations and blood typing and immunizations and I hardly got to school at all. When I wasn't being stuck or being bled, I was sick with the last thing they had done to me. Finally we had to have our whole medical history tattooed on us —identity number, Rh factor, blood type, coag time, diseases you had had, natural immunities and inoculations. The girls and the women usually had it done in invisible ink that showed up only under infrared light, or else they put it on the soles of their feet.

They asked me where I wanted it, the soles of my feet? I said no, I don't want to be crippled up; I had too much to do. We compromised on putting it where I sit down and then I ate standing up for a couple of days. It seemed a good place, private anyhow. But I had to use a mirror to see it.

Time was getting short; we were supposed to be at Mojave Space Port on 26 June, just two weeks away. It was high time I was picking out what to take. The allowance was fifty-seven and six-tenths pounds per person and had not been announced until all our body weights had been taken.

The booklet had said, "Close your terrestrial affairs as if you were dying." That's easy to say. But when you die, you can't take it with you, while here we could— fifty-seven-odd pounds of it.

The question was: what fifty-seven pounds?

My silkworms I turned over to the school biology lab and the same for the snakes. Duck wanted my aquarium but I wouldn't let him; twice he's had fish and twice he's let them die. I split them between two fellows in the troop who already had fish. The birds I gave to Mrs. Fishbein on our deck. I didn't have a cat or a dog; George says ninety floors up is no place to keep junior citizens—that's what he calls them.

I was cleaning up the mess when George came in. "Well," he says, "first time I've been able to come into your room without a gas mask."

I skipped it; George talks like that. "I still don't know what to do," I said, pointing at the heap on my bed.

"Microfilmed everything you can?"

"Yes, everything but this picture." It was a cabinet stereo of Anne, weighing about a pound and nine ounces.

"Keep that, of course. Face it, Bill, you've got to travel light. We're pioneers."

"I don't know what to throw out."

I guess I looked glum for he said, "Quit feeling sorry for yourself. Me, I've got to give up this—and that's tough, believe me." He held out his pipe.

"Why?" I asked. "A pipe doesn't weigh much."

"Because they aren't raising tobacco on Ganymede and they aren't importing any."

"Oh. Look, George, I could just about make it if it weren't for my accordion. But it licks me."

"Hmm… Have you considered listing it as a cultural item?"

"Huh?"

"Read the fine print. Approved cultural items are not covered by the personal weight schedule. They are charged to the colony."

It had never occurred to me that I might have anything that would qualify. "They wouldn't let me get away with it, George!"

"Can't rule you out for trying. Don't be a defeatist."

So two days later I was up before the cultural and scientific board, trying to prove that I was an asset. I knocked out Turkey in the Straw, Nehru's Opus 81, and the introduction to Morgenstern's Dawn of the 22nd Century, as arranged for squeeze boxes. I gave them The Green Hills of Earth for an encore.

They asked me if I liked to play for other people and told me politely that I would be informed as to the decision of the board… and about a week later I got a letter directing me to turn my accordion over to the Supply Office, Hayward Field. I was in, I was a "cultural asset"!

Four days before blastoff Dad came home early-he had been closing his office—and asked me if we could have something special for dinner; we were having guests. I said I supposed so; my accounts showed that we would have rations to turn back.

He seemed embarrassed. "Son—"

"Huh? Yes, George?"

"You know that item in the rules about families?"

"Uh, yes."

"Well, you were right about it, but I was holding out on you and now I've got to confess. I'm getting married tomorrow."

There was a sort of roaring in my ears. Dad couldn't have surprised me more if he had slapped me.

I couldn't say anything. I just stood there, looking at him. Finally I managed to get out, "But, George, you can't do that!"

"Why not, Son?"

"How about Anne?"

"Anne is dead."

"But— But—" I couldn't say anything more; I ducked into my room and locked myself in. I lay on the bed, trying to think.

Presently I heard Dad trying the latch. Then he tapped on the door and said, "Bill?"

I didn't answer. After a while he went away. I lay there a while longer. I guess I bawled, but I wasn't bawling over the trouble with Dad. It seemed the way it did the day Anne died, when I couldn't get it through my head that I wouldn't ever see her again. Wouldn't ever see her smile at me again and hear her say, "Stand tall, Billy."

And I would stand tall and she would look proud and pat my arm.

How could George do it? How could he bring some other woman into Anne's home?

I got up and had a look at myself in the mirror and then went in and set my 'fresher for a needle shower and a hard massage. I felt better afterwards, except that I still had a sick feeling in my stomach. The 'fresher blew me off and dusted me and sighed to a stop. Through the sound it seemed to me I could hear Anne speaking to me, but that must have been in my head.

She was saying, "Stand tall, Son." I got dressed again and went out.

Dad was messing around with dinner and I do mean messing. He had burned his thumb on the shortwave, don't ask me how. I had to throw out what he had been fiddling with, all except the salad. I picked out more stuff and started them cycling. Neither of us said anything.

I set the table for three and Dad finally spoke. "Better set it for four, Bill. Molly has a daughter, you know."

I dropped a fork. "Molly? You mean Mrs. Kenyon?"

"Yes. Didn't I tell you? No, you didn't give me a chance to."

I knew her all right. She was Dad's draftsman. I knew her daughter, too—a twelve-year-old brat. Somehow, it being Mrs. Kenyon made it worse, indecent. Why, she had even come to Anne's Farewell and had had the nerve to cry.

I knew now why she had always been so chummy with me whenever I was down at Dad's office. She had had her eye on George.

I didn't say anything. What was there to say?

I said "How do you do?" politely when they came in, then went out and pretended to fiddle with dinner. Dinner was sort of odd. Dad and Mrs. Kenyon talked and I answered when spoken to. I didn't listen. I was still trying to figure out how he could do it. The brat spoke to me a couple of times but I soon put her in her place.

After dinner Dad said how about all of us going to a show? I begged off, saying that I still had sorting to do. They went.

I thought and thought about it. Any way I looked at it, it seemed like a bad deal.

At first I decided that I wouldn't go to Ganymede after all, not if they were going. Dad would forfeit my bond, but I would work hard and pay it back—I wasn't going to owe them anything!

Then I finally figured out why Dad was doing it and I felt some better, but not much. It was too high a price.

Dad got home late, by himself, and tapped on my door. It wasn't locked and he came in. "Well, Son?" he said.

"'Well' what?"

"Bill, I know that this business comes as a surprise to you, but you'll get over it."

I laughed, though I didn't feel funny. Get over it! Maybe he could forget Anne, but I never would.

"In the meantime," he went on, "I want you to behave yourself. I suppose you know you were as rude as you could be without actually spitting in their faces?"

"Me rude?"I objected. "Didn't I fix dinner for them? Wasn't I polite?"

"You were as polite as a judge passing sentence. And as friendly. You needed a swift kick to make you remember your manners."

I guess I looked stubborn. George went on, "That's done; let's forget it. See here, Bill—in time you are going to see that this was a good idea. All I ask you to do is to behave yourself in the meantime. I don't ask you to fall on their necks; I do insist that you be your own normal, reasonably polite and friendly self. Will you try?"

"Uh, I suppose so." Then I went on with, "See here, Dad, why did you have to spring it on me as a surprise?"

He looked embarrassed. "That was a mistake. I suppose I did it because I knew you would raise Cain about it and I wanted to put it off."

"But I would have understood if you had only told me. I know why you want to marry her—"

"Eh?"

"I should have known when you mentioned that business about rules. You have to get married so that we can go to Ganymede——"

"What?"

I was startled. I said, "Huh? That's right, isn't it? You told me so yourself. You said—"

"I said nothing of the sort!" Dad stopped, took a deep breath, then went on slowly, "Bill, I suppose you possibly could have gathered that impression—though I am not flattered that you could have entertained it. Now I'll spell out the true situation: Molly and I are not getting married in order to emigrate. We are emigrating because we are getting married. You may be too young to understand it, but I love Molly and Molly loves me. If I wanted to stay here, she'd stay. Since I want to go, she wants to go. She's wise enough to understand that I need to make a complete break with my old background. Do you follow me?"

I said I guessed so.

"I'll say goodnight, then."

I answered, "Goodnight." He turned away, but I added, "George—" He stopped.

I blurted out. "You don't love Anne any more, do you?"

Dad turned white. He started back in and then stopped. "Bill," he said slowly, "it has been some years since I've laid a hand on you—but this is the first time I ever wanted to give you a thrashing."

I thought he was going to do it. I waited and I had made up my mind that if he touched me he was going to get die surprise of his life. But he didn't come any nearer; he just closed the door between us.

After awhile I took another shower that I didn't need and went to bed. I must have lain there an hour or more, thinking that Dad had wanted to hit me and wishing that Anne were around to tell me what to do. Finally I switched on the dancing lights and stared at them until they knocked me out.

Neither one of us said anything until breakfast was over and neither of us ate much, either. Finally Dad said, "Bill, I want to beg your pardon for what I said last night. You hadn't done or said anything to justify raising a hand to you and I had no business thinking it or saying it."

I said, "Oh, that's all right." I thought about it and added, "I guess I shouldn't have said what I did."

"It was all right to say it What makes me sad is that you could have thought it. Bill, I've never stopped loving Anne and I'll never love her any less."

"But you said—" I stopped and finished, "I just don't get it."

"I guess there is no reason to expect you to." George stood up. "Bill, the ceremony is at fifteen o'clock. Will you be dressed and ready about an hour before that time?"

I hesitated and said, "I won't be able to, George. I've got a pretty full day."

His face didn't have any expression at all and neither did his voice. He said, "I see," and left the room. A bit later he left the apartment. A while later I. tried to call him at his office, but the autosecretary ground out the old stall about "Would you like to record a message?" I didn't. I figured that George would be home some time before fifteen hundred and I got dressed in my best. I even used some of Dad's beard cream.

He didn't show up. I tried the office again, and again, got the "Would-you-like-to-recorda-message?" routine. Then I braced myself and looked up the code on Mrs. Kenyon.

He wasn't there. Nobody was there.

The time crawled past and there was nothing I could do about it. After a while it was fifteen o'clock and I knew that my father was off somewhere getting married but I didn't know where. About fifteen-thirty I went out and went to a show.

When I got back the red light was shining on the phone. I dialed playback and it was Dad: "Bill I tried to reach you but you weren't in and I can't wait. Molly and I are leaving on a short trip. If you need to reach me, call Follow Up Service, Limited, in Chicago—we'll be somewhere in Canada. We'll be back Thursday night. Goodbye." That was the end of the recording.

Thursday night—blastoff was Friday morning.

3. Space Ship *Bifrost*

Dad called me from Mrs. Kenyon's—I mean from Molly's—apartment Thursday night. We were both polite but uneasy. I said yes, I was all ready and I hoped they had had a nice time. He said they had and would I come over and we would all leave from there in the morning.

I said I hadn't known what his plans were, so I had bought a ticket to Mojave port and had reserved a room at Hotel Lancaster. What did he want me to do?

He thought about it and said, "It looks like you can take care of yourself, Bill."

"Of course I can."

"All right. We'll see you at the port. Want to speak to Molly?"

"Uh, no, just tell her hello for me."

"Thanks, I will." He switched off.

I went to my room and got my kit—fifty-seven and fifty-nine hundredths pounds; I couldn't have added a clipped frog's hair. My room was bare, except for my Scout uniform. I couldn't afford to take it, but I hadn't thrown it away yet.

I picked it up, intending to take it to the incinerator, then stopped. At the physical exam I had been listed at one hundred thirtyone and two tenths pounds mass in the clothes I would wear for blast off.

But I hadn't eaten much the last few days.

I stepped into the 'fresher and onto the scales—one hundred twenty-nine and eight tenths. I picked up the uniform and stepped back on the scales—one hundred thirty-two and five tenths.

William, I said, you get no dinner, you get no breakfast, and you drink no water tomorrow morning. I bundled up my uniform and took it along.

The apartment was stripped. As a surprise for the next tenant I left in the freezer the stuff I had meant to eat for supper, then switched all the gadgets to zero except the freezer, and locked the door behind me. It felt funny; Anne and George and I had lived there as far back as I could remember.

I went down to subsurface, across town, and caught the In-Coast tube for Mojave. Twenty minutes later I was at Hotel Lancaster in the Mojave Desert.

I soon found out that the "room" I had reserved was a cot in the billiard room. I trotted down to find out what had happened.

I showed the room clerk the 'stat that said I had a room coming to me. He looked at it and said, "Young man, have you ever tried to bed down six thousand people at once?"

I said no, I hadn't.

"Then be glad you've got a cot. The room you reserved is occupied by a family with nine children."

I went.

The hotel was a madhouse. I couldn't have gotten anything to eat even if I hadn't promised myself not to eat; you couldn't get within twenty yards of the dining room. There were children underfoot everywhere and squalling brats galore. There were emigrant families squatting in the ball room. I looked them over and wondered how they had picked them; out of a grab bag?

Finally I went to bed. I was hungry and got hungrier. I began to wonder why I was going to all this trouble to hang on to a Scout uniform I obviously wasn't going to use.

If I had had my ration book I would have gotten up and stood in line at the dining room—but Dad and I had turned ours in. I still had some money and thought about trying to find a free-dealers; they say you can find them around a hotel. But Dad says that "free-dealer" is a fake word; they are black marketeers and no gentleman will buy from them.

Besides that I didn't have the slightest idea of how to go about finding one.

I got up and got a drink and went back to bed and went through the relaxing routine. Finally I got to sleep and dreamed about strawberry shortcake with real cream, the kind that comes from cows.

I woke up hungry but I suddenly remembered that this was it!—my last day on Earth. Then I was too excited to be hungry. I got up, put on my Scout uniform and my ship suit over it.

I thought we would go right on board. I was wrong.

First we had to assemble under awnings spread out in front of the hotel near the embarking tubes. It wasn't air conditioned outside, of course, but it was early and the desert wasn't really hot yet. I found the letter "L" and sat down under it, sitting on my baggage. Dad and his new family weren't around yet; I began to wonder if I was going to Ganymede by myself. I didn't much care.

Out past the gates about five miles away, you could see the ships standing on the field, the *Daedalus* and the *Icarus,* pulled off the EarthMoon run for this one trip, and the old *Bifrost* that had been the shuttle rocket to Supra-New-York space station as far back as I could remember.

The *Daedalus* and the *Icarus* were bigger but I hoped I would get the *Bifrost*; she was the first ship I ever saw blast off.

A family put their baggage down by mine. The mother looked out across the field and said, "Joseph, which one is the *Mayflower*?"

Her husband tried to explain to her, but she still was puzzled. I nearly burst, trying to keep from laughing. Here she was, all set to go to Ganymede and yet she was so dumb she didn't even know that the ship she was going in had been built out in space and couldn't land anywhere.

The place was getting crowded with emigrants and relatives coming to see them off, but I still didn't see anything of Dad. I heard my name called and turned around and there was Duck Miller. "Gee, Bill," he said, "I thought I'd missed you."

"Hi, Duck. No, I'm still here."

"I tried to call you last night but your phone answered 'service discontinued,' so I hooked school and came up."

"Aw, you shouldn't have done that."

"But I wanted to bring you this." He handed me a package, a whole pound of chocolates. I didn't know what to say.

I thanked him and then said, "Duck, I appreciate it, I really do. But I'll have to give them back to you."

"Huh? Why?"

"Weight Mass, I mean. I can't get by with another ounce."

"You can carry it."

"That won't help. It counts just the same."

He thought about it and said, "Then let's open it."

I said, "Fine," and did so and offered him a piece. I looked at them myself and my stomach was practically sitting up and begging. I don't know when I've been so hungry.

I gave in and ate one. I figured I would sweat it off anyhow; it was getting hot and I had my Scout uniform on under my ship suit—and that's no way to dress for the Mojave Desert in June! Then I was thirstier than ever, of course; one thing leads to another.

I went over to a drinking fountain and took a very small drink. When I came back I closed the candy box and handed it back to Duck and told him to pass it around at next Scout meeting and tell the fellows I wished they were going along. He said he would and added, "You know, Bill, I wish I was going. I really do."

I said I wished he was, too, but when did he change his mind? He looked embarrassed but about then Mr. Kinski showed up and then Dad showed up, with Molly and the brat—Peggy—and Molly's sister, Mrs. van Metre. Everybody shook hands all around and Mrs. van Metre started to cry and the brat wanted to know what made my clothes so bunchy and what was I sweating about?

George was eyeing me, but about then our names were called and we started moving through the gate.

George and Molly and Peggy were weighed through and then it was my turn. My baggage was right on the nose, of course, and then I stepped on the scales. They read one hundred and thirtyone and one tenth pounds—I could have eaten another chocolate.

"Check!" said the weightmaster, then he looked up and said, "What in the world have you got on, son?"

The left sleeve of my uniform had started to unroll and was sticking out below the half sleeve of my ship suit. The merit badges were shining out like signal lights.

I didn't say anything. He started feeling the lumps the uniform sleeves made. "Boy," he said, "you're dressed like an arctic explorer; no wonder you're sweating. Didn't you know you weren't supposed to wear anything but the gear you were listed in?"

Dad came back and asked what the trouble was? I just stood there with my ears burning. The assistant weightmaster got into the huddle and they argued what should be done. The weightmaster phoned somebody and finally he said, "He's inside his weight limit; if he wants to call that monkey suit part of his skin, we'll allow it. Next customer, please!"

I trailed along, feeling foolish. We went down inside and climbed on the slide strip, it was cool down there, thank goodness. A few minutes later we got off at the loading room down under the rocket ship. Sure enough, it was the *Bifrost*, as I found out when the loading elevator poked above ground and stopped at the passenger port. We filed in.

They had it all organized. Our baggage had been taken from us in the loading room; each passenger had a place assigned by his weight. That split us up again; I was on the deck immediately under the control room. I found my place, couch 14-D, then went to a view port where I could see the *Daedalus* and the *Icarus*.

A brisk little stewardess, about knee high to a grasshopper, checked my name off a list and offered me an injection against dropsickness. I said no, thanks.

She said, "You've been out before?"

I admitted I hadn't; she said, "Better take it."

I said I was a licensed air pilot; I wouldn't get sick I didn't tell her that my license was just for copters. She shrugged and turned away. A loudspeaker said, "The *Daedalus* is cleared for blasting." I moved up to get a good view.

The *Daedalus* was about a quarter of a mile away and stood up higher than we did. She had fine lines and was a mighty pretty sight, gleaming in the morning sunshine. Beyond her and to the right, clear out at the edge of the field, a light shone green at the traffic control blockhouse.

She canted slowly over to the south, just a few degrees.

Fire burst out of her base, orange, and then blinding white. It splashed down into the ground baffles and curled back up through the ground vents. She lifted.

She hung there for a breath and you could see the hills shimmer through her jet. And she was gone.

Just like that—she was gone. She went up out of there like a scared bird, just a pencil of white fire in the sky, and was gone while we could still hear and feel the thunder of her jets inside the compartment.

My ears were ringing. I heard someone behind me say, "But I haven't had breakfast. The Captain will just have to wait. Tell him, Joseph."

It was the woman who hadn't known that the *Mayflower* was a space-to-space ship. Her husband tried to hush her up, but he didn't have any luck. She called over the stewardess. I heard her answer, "But, madam, you can't speak to the Captain now. He's preparing for blastoff."

Apparently that didn't make any difference. The stewardess finally got her quiet by solemnly promising that she could have breakfast after blastoff. I bent my ears at that and I decided to put in a bid for breakfast, too.

The *Icarus* took off twenty minutes later and then the speaker said, "All hands! Acceleration stations–prepare to blast off." I went back to my couch and the stewardess made sure that we were all strapped down. She cautioned us not to unstrap until she said we could. She went down to the deck below.

I felt my ears pop and there was a soft sighing in the ship. I swallowed and kept swallowing. I knew what they were doing: blowing the natural air out and replacing it with the standard helium-oxygen mix at half sea-level pressure. But the woman—the same one—didn't like it. She said, "Joseph, my head aches. Joseph, I can't breathe. Do something!"

Then she clawed at her straps and sat up. Her husband sat up, too, and forced her back down.

The *Bifrost* tilted over a little and the speaker said, "Minus three minutes!"

After a long time it said, "Minus two minutes!"

And then "Minus one minutel" and another voice took up the count:

"Fifty-nine! Fifty-eight! Fifty-seven!"

My heart started to pound so hard I could hardly hear it. But it went on: "-thirty-five! Thirty-four! Thirty-three! Thirty-two! Thirtyone! Half! Twenty-nine! Twentyeight!"

And it got to be: "Ten!"

And "Nine!"

"Eight!

"Seven!

"And six!

"And five!

"And four!

"And three!

"And two—"

I never did hear them say "one" or "fire" or whatever they said. About then something fell on me and I thought I was licked. Once, exploring a cave with the fellows, a bank collapsed on me and I had to be dug out. It was like that—but nobody dug me out.

My chest hurt My ribs seemed about to break. I couldn't lift a finger. I gulped and couldn't get my breath.

I wasn't scared, not really, because I knew we would take off with a high g, but I was awfully uncomfortable. I managed to turn my head a little and saw that the sky was already purple. While I watched, it turned black and the stars came out, millions of stars. And yet the Sun was still streaming in through the port

The roar of the jets was unbelievable but the noise started to die out almost at once and soon you couldn't hear it at all. They say the old ships used to be noisy even after you passed the speed of sound; the *Bifrost* was not. It got as quiet as the inside of a bag of feathers.

There was nothing to do but lie there, stare out at that black sky, try to breathe, and try not to think about the weight sitting on you.

And then, so suddenly that it made your stomach turn flipflops, you didn't weigh anything at all.

4. Captain DeLongPre

Let me tell you that the first time you fall is no fun. Sure, you get over it. If you didn't you would starve. Old space hands even get so they like it—weightlessness, I mean. They say that two hours of weightless sleep is equal to a full night on Earth. I got used to it, but I never got to like it.

The *Bifrost* had blasted for a little more than three minutes. It seemed lots longer because of the high acceleration; we had blasted at nearly six g. Then she was in free orbit for better than three hours and we fell the whole time, until the Captain started to maneuver to match orbits with the *Mayflower*.

In other words we fell straight up for more than twenty thousand miles.

Put that way, it sounds silly. Everybody knows that things don't fall up; they fall down.

Everybody knew the world was flat, too.

We fell up.

Like everybody, I had had the elements of space ballistics in grammar school physics, and goodness knows there have been enough stories about how you float around in a spaceship when it's in a free orbit. But, take it from me, you don't really believe it until you've tried it.

Take Mrs. Tarbutton—the woman who wanted breakfast. I suppose she went to school like everybody else. But she kept insisting that the Captain had to do something about it. What he could do I don't know; find her a small asteroid, maybe.

Not that I didn't sympathize with her—or with myself, I guess. Ever been in an earthquake? You know how everything you ever depended on suddenly goes back on you and terra firma isn't firma any longer? It's like that, only much worse. This is no place to review grammar school physics but when a spaceship is in a free trajectory, straight up or any direction, the ship and everything in it moves along together and you fall, endlessly—and your stomach darn near falls out of you.

That was the first thing I noticed. I was strapped down so that I didn't float away, but I felt weak and shaky and dizzy and as if I had been kicked in the stomach. Then my mouth filled with saliva and I gulped and I was awfully sorry I had eaten that chocolate.

But it didn't come up, not quite.

The only thing that saved me was no breakfast. Some of the others were not so lucky. I tried not to look at them. I had intended to unstrap as soon as we went free and go to a port so I could look at Earth, but I lost interest in that project entirely. I stayed strapped down, and concentrated on being miserable.

The stewardess came floating out the hatch from the next deck, shoved herself along with a toe, checked herself with a hand at the center stanchion, and hovered in the air in a swan dive, looking us over. It was very pretty to watch if I'd been in shape to appreciate it.

"Is everybody comfy?" she said cheerfully.

It was a silly remark but I suppose nurses get that way. Somebody groaned and a baby on the other side of the compartment started to cry. The stewardess moved over to Mrs. Tarbutton and said, "You may have breakfast now. What would you like? Scrambled eggs?"

I clamped my jaw and turned my head away, wishing she would shut up. Then I looked back. She had paid for that silly remark—and she had to clean it up.

When she was through with Mrs. Tarbutton I said, "Uh-oh, Miss—"

"Andrews."

"Miss Andrews, could I change my mind about that dropsick injection?"

"Righto, chum," she agreed, smiling, and whipped out an injector from a little kit she had at her belt. She gave me the shot. It burned and for a moment I thought I was going to lose the chocolate after all. But then things quieted down and I was almost happy in a miserable sort of way.

She left me and gave shots to some others who had kidded themselves the same way I had. Mrs. Tarbutton she gave another sort of shot to knock her out entirely. One or two of the hardier souls unstrapped themselves and went to the ports; I decided I was well enough to try it.

It's not as easy as it looks, this swimming around in free fall. I undid the safety belts and sat up; that's all I meant to do. Then I was scrambling in the air, out of control, trying frantically to grasp at anything.

I turned over in the air and cracked the back of my head against the underside of the control room deck and saw stars, not the ones out the ports—some of my own. Then the deck with the couches on it was approaching me slowly.

I managed to grab a safety belt and came to anchor. The couch it belonged to was occupied by a little plump man. I said, "Excuse me."

He said, "Don't mention it," and turned his face away, looking as if he hated me. I couldn't stay there and I couldn't even get back to my own couch without grabbing handholds on other couches that were occupied, too, so I pushed off again, very gently this time, and managed to grab hold when I bumped against the other deck.

It had handholds and grab lines all over it. I didn't let go again, but pulled myself along, monkey fashion, to one of the ports.

And there I got my first view of Earth from space.

I don't know what I expected, but it wasn't what I expected. There it was, looking just like it does in the geography books, or maybe more the way it does in the station announcements of Super-New-York TV station. And yet it was different. I guess I would say it was like the difference between being told about a good hard kick in the rear and actually being kicked.

Not a transcription. Alive.

For one thing it wasn't prettily centered in a television screen; it was shouldering into one side of the frame of the port, and the aft end of the ship cut a big chunk out of the Pacific Ocean. And it was moving, shrinking. While I hung there it shrunk to about half the size it was when I first got there and got rounder and rounder. Columbus was right.

From where I was it was turned sideways; the end of Siberia, then North America, and finally the north half of South America ran across from left to right. There were clouds over Canada and the eastern part of the rest of North America; they were the whitest white I ever saw—whiter than the north pole cap. Right opposite us was the reflection of the Sun on the ocean; it hurt my eyes. The rest of the ocean was almost purple where there weren't clouds.

It was so beautiful my throat ached and I wanted to reach out and touch it.

And back of it were stars, even brighter and bigger and more of them than the way they look from Little America.

Pretty soon there were more people crowding around, trying to see, and kids shoving and their mothers saying, "Now, now, darling!" and making silly remarks themselves. I gave up. I pulled myself back to my couch and put one belt around me so I wouldn't float away and thought about it. It makes you proud to know that you come from a big, fancy planet like that. I got to thinking that I hadn't seen all of it, not by a long sight, in spite of all the geography trips I had made and going to one Scout roundup in Switzerland and the time George and Anne and I went to Siam.

And now I wasn't going to see any more of it. It made me feel pretty solemn.

I looked up; there was a boy standing in front of me. He said, "What's the trouble, William, my boy? Dropsick?"

It was that twerp Jones. You could have knocked me out with a feather. If I had known he was going to emigrate, I would have thought twice about it.

I asked him where in the world he had come from.

"The same place you did, naturally. I asked you a question."

I informed him that I was not dropsick and asked him whatever gave him that silly notion. He reached out and grabbed my arm and turned it so that the red spot the injection had made showed. He laughed and I jerked my arm away.

He laughed again and showed me his arm; it had a red spot on it, too. "Happens to the best of us," he said. "Don't be shy about it."

Then he said, "Come on. Let's look around the joint before they make us strap down again."

I went along. He wasn't what I would pick for a buddy but he was a familiar face. We worked our way over to the hatch to the next deck. I started to go through but Jones stopped me. "Let's go into the control room," he suggested.

"Huh? Oh, they wouldn't let us!"

"Is it a crime to try? Come on." We went back the other way and through a short passage. It ended in a door that was marked: CONTROL ROOM-STAY OUT! Somebody had written under it: This means you!!! and somebody else had added: Who? Me?

Jones tried it; it was locked. There was a button beside it; he pushed it.

It opened and we found ourselves staring into the face of a man with two stripes on his collar. Behind him was an older man with four stripes on his; he called out, "Who is it, Sam? Tell 'em we're not in the market."

The first man said, "What do you kids want?"

Jones said, "Please, sir, we're interested in astrogation. Could we have permission to visit the control room?"

I could see he was going to chuck us out and I had started to turn away when the older man called out, "Oh, shucks, Sam, bring 'em in!"

The younger fellow shrugged and said, "As you say, Skipper."

We went in and the Captain said, "Grab on to something; don't float around. And don't touch anything, or I'll cut your ears off. Now who are you?"

We told him; he said, "Glad to know you, Hank–same to you, Bill. Welcome aboard." Then he reached out and touched the sleeve of my uniform—it had come loose again. "Son, your underwear is showing."

I blushed and told him how I happened to be wearing it. He laughed and said, "So you swindled us into lifting it anyway. That's rich—eh, Sam? Have a cup of coffee."

They were eating sandwiches and drinking coffee— not from cups, of course, but from little plastic bags like they use for babies. The bags even had nipples on them. I said no, thanks. While the shot Miss Andrews gave me had made me feel better, it hadn't made me feel that much better. Hank Jones turned it down, too.

The control room didn't have a port in it of any sort. There was a big television screen forward on the bulkhead leading to the nose, but it wasn't turned on. I wondered what Mrs. Tarbutton would think if she knew that the Captain couldn't see where we were going and didn't seem to care.

I asked him about the ports. He said ports were strictly for tourists. "What would you do with a port if you had one?" he asked. "Stick your head out the window and look for road signs? We can see anything we need to see. Sam, heat up the video and show the kids."

"Aye aye, Skipper." The other chap swam over to his couch and started turning switches. He left his sandwich hanging in the air while he did so.

I looked around. The control room was circular and the end we came in was bigger than the other end; it was practically up in the nose of the ship and the sides sloped in. There were two couches, one for the pilot and one for the copilot, flat against the wall that separated the control room from the passenger compartments. Most of the space between the couches was taken up by the computer.

The couches were fancier than the ones the passengers had; they were shaped to the body and they lifted the knees and the head and back, like a hospital bed, and there were arm rests to support their hands over the ship's controls. An instrument board arched over each couch at the middle, where the man in the couch could see the dials and stuff even when his head was pushed back into the cushions by high g.

The TV screen lighted up and we could see Earth; it filled most of the screen. "That's 'View Aft'," the copilot said, "from a TV camera in the tail. We've got 'em pointing in all directions. Now we'll try 'View Forward'." He did, but it didn't amount to anything, just a few tiny little dots that might have been stars. Hank said you could see more stars out a port.

"You don't use it to look at stars," he answered. "When you need to take a star sight, you use the coelostats. Like this." He lay back on the couch and reached behind his head, pulling an eye piece arrangement over his face until the rubber guard fitted over one eye without lifting his head off the couch. "Coelostat" is just a trick name for a telescope with a periscope built into it. He didn't offer to let us look through it, so I looked back at the instrument board. It had a couple of radar presentations, much like you'll find in any atmosphere ship, even in a copter, and a lot of other instruments, most of which I didn't understand, though some of them were pretty obvious, like approach rate and throat temperature and mass ratio and ejection speed and such.

"Watch this," said the copilot. He did something at his controls; one of the tiny blips on the TV screen lit up very brightly, blinked a few times, then died away. "That was Supra-New-York; I triggered her radar beacon. You are not seeing it by television; it's radar brought on to the same screen." He fiddled with the controls again and another light blinked, two longs and a short. "That's where they're building the Star Rover."

"Where's the *Mayflower*?" Hank asked.

"Want to see where you're going, eh?" He touched his controls again; another light came on, way off to one side, flashing in groups of three.

I said it didn't look much like we were going there. The Captain spoke up. "We're taking the long way round, past the fair grounds. That's enough, Sam. Lock your board."

We all went back where the Captain was still eating. "You an Eagle Scout?" he asked me. I said yes and Hank said he was too.

"How old were you when you made it?" he wanted to know. I said I had been thirteen, so Hank said twelve, whereupon the Captain claimed he had made it at eleven. Personally I didn't believe either one of them.

The Captain said so now we were going out to Ganymede; he envied both of us. The copilot said what was there to envy about that?

The Captain said, "Sam, you've got no romance in your soul. You'll live and die running a ferry boat."

"Maybe so," the copilot answered, "but I sleep home a lot of nights."

The Captain said pilots should not marry. "Take me," he said, "I always wanted to be a deepspace man. I was all set for it, too, when I was captured by pirates and missed my chance. By the time I had the chance again, I was married."

"You and your pirates," said the copilot.

I kept my face straight. Adults always think anybody younger will swallow anything; I try not to disillusion them.

"Well, all that's as may be," said the Captain. "You two young gentlemen run along now. Mr. Mayes and I have got to fake up a few figures, or we'll be landing this bucket in South Brooklyn."

So we thanked him and left.

I found Dad and Molly and the Brat in the deck aft of my own. Dad said, "Where have you been, Bill? I've been looking all over the ship for you."

I told them, "Up in the control room with the Captain."

Dad looked surprised and the Brat made a face at me and said, "Smarty, you have not. Nobody can go up there."

I think girls should be raised in the bottom of a deep, dark sack until they are old enough to know better. Then when it came time, you could either let them out or close the sack and throw them away, whichever was the best idea.

Molly said, "Hush, Peggy."

I said, "You can just ask Hank. He was with me. We—" I looked around but Hank was gone. So I told them what had happened, all but the part about pirates.

When I finished the Brat said, "I want to go into the control room, too."

Dad said he didn't think it could be arranged. The Brat said, "Why not? Bill went."

Molly said hush again. "Bill is a boy and older than you are." The Brat said it wasn't fair.

I guess she had something there—but things hardly ever are. Dad went on, "You should feel flattered, Bill, being entertained by the famous Captain DeLongPre."

"Huh?"

"Maybe you are too young to remember it. He let himself be sealed into one of the robot freighters used to jump thorium ore from the lunar mines—and busted up a ring of hijackers, a gang the newscasters called the 'Ore Pirates.'"

I didn't say anything.

I wanted to see the *Mayflower* from space, but they made us strap down before I could locate it. I got a pretty good view of Supra-New-York though; the *Mayflower* was in the 24-hour orbit the space station rides in and we were closing almost directly on it when the word came to strap down.

Captain DeLongPre was quite some pilot. He didn't fiddle around with jockeying his ship into the new groove; he gave one long blast on the jet, the right time, the right amount, and the right direction. As it says in the physics book, "every one-plane correction-of-orbit problem which can be solved at all, can be solved with a single application of acceleration"—provided the pilot is good enough.

He was good enough. When we went weightless again, I looked over my shoulder out a port and there was the *Mayflower*, with the Sun gleaming on her, large as life and not very far away. There was the softest sort of a correction bump and the loudspeaker sang out, "Contact completed. You may unstrap."

I did and went to the port from which we could see the *Mayflower*. It was easy to see why she could never land; she had no airfoils of any sort, not even fins, and she was the wrong shape—almost spherical except that one side came out to a conical point.

She looked much too small—then I realized that a little bulge that was sticking out past her edge at one point was actually the bow of the *Icarus*, unloading on the far side. Then suddenly she was enormous and the little flies on her were men in space suits.

One of them shot something at us and a line came snaking across. Before the knob on the end of it quite reached us there was a bright purple brush discharge from the end of it and every hair on my head stood straight up and my skin prickled. A couple of the women in the compartment squealed and I heard Miss Andrews soothing them down and telling them that it was just the electrical potential adjusting between the two ships. If she had told them it was a bolt of lightning she would have been just as correct, but I don't suppose that would have soothed them.

I wasn't scared; any kid who had fooled around with radio or any sort of electronics would have expected it.

The knob on the line clunked against the side of the ship and after a bit the little line was followed by a heavier line and then they warped us together, slowly. The *Mayflower* came up until she filled the port.

After a bit my ears popped and the loudspeaker said, "All hands—prepare to disembark."

Miss Andrews made us wait quite a while, then it was our deck's turn and we pulled ourselves along to the deck we had come in by. Mrs. Tarbutton didn't come along; she and her husband were having some sort of a discussion with Miss Andrews.

We went right straight out of our ship, through a jointed steel drum about ten feet long, and into the *Mayflower*.

5. Captain Harkness

Do you know the worst thing about spaceships? They smell bad.

Even the *Mayflower* smelled bad and she was brand new. She smelled of oil and welding and solvents and dirty, sweaty smells of all the workmen who had lived in her so long. Then we came, three shiploads of us, most of us pretty whiff with that bad odor people get when they're scared or very nervous. My stomach still wasn't happy and it almost got me.

The worst of it is that there can't be very good 'freshers in a ship; a bath is a luxury. After the ship got organized we were issued tickets for two baths a week, but how far does that go, especially when a bath means two gallons of water to sponge yourself off with?

If you felt you just had to have a bath, you could ask around and maybe buy a ticket from somebody who was willing to skip one. There was one boy in my bunk room who sold his tickets for four weeks running until we all got sick of it and gave him an unscheduled bath with a very stiff brush. But I'm getting ahead of myself.

And you couldn't burn your clothes either; you had to wash them.

When we first got into the *Mayflower* it took them maybe half an hour to get us all sorted out and into our acceleration couches. The people from the *Daedalus* and the *Icarus* were supposed to be stowed away by the time we got there, but they weren't and the passageways were traffic jams. A traffic jam when everybody is floating, and you don't know which end is up, is about eight times as confusing as an ordinary one.

There weren't any stewardesses to get us straight, either; there were emigrants instead, with signs on their chests reading SHIP'S AIDE–but a lot of them needed aid themselves; they were just as lost as anybody else. It was like amateur theatricals where the ushers don't know how to find the reserved seats.

By the time I was in the bunk room I was assigned to and strapped down there were bells ringing all over the place and loudspeakers shouting: "Prepare for acceleration! Ten minutes!"

Then we waited.

It seemed more like half an hour. Presently the count-off started. I said to myself, William, if the blastoff from Earth was rugged, this is going to knock the teeth right out of your head. I knew what we were going to build up to—better than ninety-three miles per second. That's a third of a million miles an hour! Frankly I was scared.

The seconds ticked away; there was a soft push that forced me down against the cushions—and that was all. I just lay there; the ceiling was the ceiling again and the floor was under me, but I didn't feel extra heavy, I felt fine.

I decided that was just the first step; the next one would be a dilly.

Up overhead in the bunk room was a display screen; it lighted up and I was looking into the face of a man with four collar stripes; he was younger than Captain DeLongPre. He smiled and said, "This is your Captain speaking, friends—Captain Harkness. The ship will remain at one gravity for a little more than four hours.I think it is time to serve lunch, don't you?"

He grinned again and I realized that my stomach wasn't bothering me at all—except that I was terribly hungry. I guess he knew that all of us ground hogs would be starving to death as soon as we were back to normal weight. He went on:

"We'll try to serve you just as quickly as possible. It is all right for you to unstrap now, sit up, and relax, but I must ask you to be very careful about one thing:

"This ship is precisely balanced so that the thrust of our drive passes exactly through our center of gravity. If that were not so, we would tend to spin instead of moving in a straight line—and we might fetch up in the heart of the Sun instead of at Ganymede.

"None of us wants to become an impromptu barbecue, so I will ask each of you not to move unnecessarily from the neighborhood of your couch. The ship has an automatic compensator for a limited amount of movement, but we must not overload it—so get permission from your ship's aide before moving as much as six inches from your present positions."

He grinned again and it was suddenly a most unpleasant grin. "Any one violating this rule will be strapped down by force—and the Captain will assign punishment to fit the crime after we are no longer under drive."

There wasn't any ship's aide in our compartment; all we could do was wait. I got acquainted with the boys in the bunkroom, some older, some younger. There was a big, sandy-haired boy about seventeen, by the name of Edwards—"Noisy" Edwards. He got tired of waiting.

I didn't blame him; it seemed like hours went past and still nothing to eat. I thought we had been forgotten.

Edwards had been hanging around the door, peering out. Finally he said, "This is ridiculous! We can't sit here all day. I'm for finding out what's the hold up. Who's with me?"

One of the fellows objected, "The Captain said to sit tight."

"What if he did? And what can he do if we don't? We aren't part of the crew."

I pointed out that the Captain had authority over the whole ship, but he brushed me off. "Tommyrot! We got a right to know what's going on—and a right to be fed. Who's coming along?"

Another boy said, "You're looking for trouble, Noisy."

Edwards stopped; I think he was worried by the remark but he couldn't back down. Finally he said, "Look, we're supposed to have a ship's aide and we haven't got one. You guys elect me ship's aide and I'll go bring back chow. How's that?"

Nobody objected out loud. Noisy said, "Okay, here I go."

He couldn't have been gone more than a few seconds when a ship's aide showed up carrying a big box of packaged rations. He dealt them out and had one left over. Then he counted the bunks. "Weren't there twenty boys in here?" he asked.

We looked at each other but nobody said anything. He pulled out a list and called our names. Edwards didn't answer, of course, and he left, taking Noisy's ration with him.

Then Noisy showed up and saw us eating and wanted to know where his lunch was. We told him; he said, "For the love of Mike! Why didn't you guys save it for me? A fine bunch you turned out to be." And he left again.

He came back shortly, looking mad. A ship's aide followed him and strapped him down.

We had about reached the teeth-picking stage when the screen on the ceiling lit up again and there was the Moon. It looked as if we were headed right toward it and coming up fast. I began to wonder if

Captain Harkness had dropped a decimal point.

I lay back on my couch and watched it grow. After a while it looked worse. When it had grown until it filled the screen and more and it seemed as if we couldn't possibly miss, I saw that the mountains were moving past on the screen from right to left. I breathed a sigh of relief; maybe the Old Man knew what he was doing after all.

A voice came over the speaker: "We are now passing the Moon and tacking slightly in so doing. Our relative speed at point of closest approach is more than fifty miles per second, producing a somewhat spectacular effect."

I'll say it was spectacular! We zipped across the face of the Moon in about half a minute, then it faded behind us. I suppose they simply kept a TV camera trained on it, but it looked as if we had dived in, turned sharply, and raced out again. Only you don't make sharp turns at that speed.

About two hours later they stopped gunning her. I had fallen asleep and I dreamed I was making a parachute jump and the chute failed to open. I woke up with a yell, weightless, with my stomach dropping out of me again. It took me a moment to figure out where I was.

The loudspeaker said: "End of acceleration. Spin will be placed on the ship at once."

But it did not happen all at once; it happened very slowly. We drifted toward one wall and slid down it toward the outer wall of the ship. That made what had been the outer wall the floor; we stood on it — and the side with the bunks on it was now a wall and the side with the TV screen on it, which had been the ceiling, was now the opposite wall. Gradually we got heavier.

Noisy was still strapped to his couch; the ship's aide had moved the buckles so that he could not reach them himself. Now he was up against the wall, hanging on the straps like a papoose. He began to yell for us to help him down.

He was not in any danger and he could not have been too uncomfortable, for we weren't up to a full gravity, not by a whole lot. It turned out later that the Captain had brought the spin up to one-third g and held it there, because Ganymede has one-third g. So there wasn't any urgent need to turn Noisy loose.

Nor was there any rush to do so. We were still discussing it and some of the fellows were making comical remarks which Noisy did not appreciate when the same ship's aide came in, unstrapped Noisy, and told all of us to follow him.

That's how I happened to attend Captain's mast.

"Captain's mast" is a sort of court, like when in ancient times the lord of the countryside would sit and dispense the high and middle justice. We followed the aide, whose name was Dr. Archibald, to Captain Harkness's cabin. There were a lot of other people waiting there in the passage outside the cabin. Presently Captain Harkness came out and Noisy was the first case.

We were all witnesses but the Captain didn't question but a few of us; I wasn't questioned. Dr. Archibald told about finding Noisy wandering around the ship while we were under acceleration and the Captain asked Noisy if he had heard the order to stay at his bunk?

Noisy beat around the bush a good deal and tried to spread the blame on all of us, but when the Captain pinned him down he had to admit that he had heard the order.

Captain Harkness said, "Son, you are an undisciplined lunk. I don't know what sort of trouble you'll run into as a colonist, but so far as my ship is concerned, you've had it."

He mused for a moment, than added, "You say you did this because you were hungry?"

Noisy said yes, he hadn't had anything since breakfast and he still hadn't had his lunch.

"Ten days bread and water," said the Captain. "Next case."

Noisy looked as if he couldn't believe his ears.

The next case was the same thing, but a woman-one of those large, impressive ones who run things. She had had a row with her ship's aide and had stomped off to tell the Captain about it personally—while we were under acceleration.

Captain Harkness soon cut through the fog. "Madam," he said, with icy dignity, "by your bullheaded stupidity you have endangered the lives of all of us. Do you have anything to say for yourself?"

She started a tirade about how "rude" the aide had been to her and how she never heard of anything so preposterous in her life as this kangaroo court, and so forth, and so forth. The Captain cut her short.

"Have you ever washed dishes?" he asked.

"Why, no!"

"Well, you are going to wash dishes—for the next four hundred million miles."

6. E = MC^2

I looked up dad after they let us go. It was like finding a needle in a haystack but I kept asking and presently I found him. Molly and he had a room to themselves. Peggy was there and I thought she was rooming with them, which annoyed me some, until I saw that there were only two couches and realized that Peggy must be in a dormitory. It turned out that all the kids over eight were in dormitories.

Dad was busy unclamping their couches and moving them to what was the floor, now that the ship was spinning. He stopped when I came in and we sat around and talked. I told him about Captain's mast. He nodded. "We saw it in the screen. I didn't notice your shining face, however."

I said I hadn't been called on.

"Why not?" Peggy wanted to know.

"How should I know?" I thought about mast for a bit and said, "Say, George, the skipper of a ship in space is just about the last of the absolute monarchs, isn't he?"

Dad considered it and said, "Mmm… no, he's a constitutional monarch. But he's a monarch all right."

"You mean we have to bow down to him and say 'Your Majesty?" Peggy wanted to know.

Molly said, "I don't think that would be advisable, Peg."

"Why not? I think it would be fun."

Molly smiled. "Well, let me know how you make out. I suspect that he will just turn you over his knee and paddle you."

"Oh, he wouldn't dare! I'd scream."

I wasn't so sure. I remembered those four hundred million miles of dirty dishes. I decided that, if the Captain said "Frog," I'd hop.

If Captain Harkness was a monarch, he didn't seem anxious to rule; the first thing he had us do was to hold an election and set up a ship's council. After that we hardly laid eyes on him.

Everybody over eighteen could vote. The rest of us got to vote, too; we were told to setup a junior council—not that it was ever good for anything.

But the senior council, the real council, ran the ship from then on. It even acted as a court and the Captain never handed out punishments again. Dad told me that the Captain reviewed everything that the council did, that he had to, to make it legal—but I never heard of him overruling their decisions.

And you know what the first thing was that that council did—after setting up meal hours and simple things like that? They decided we had to go to school!

The junior council promptly held a meeting and passed a resolution against it, but it didn't mean anything. We had school, just the same.

Peggy was on the junior council. I asked her why she didn't resign if she wasn't going to do anything. I was just teasing—as a matter of fact she put up quite a battle for us.

School wasn't so bad, though. There is very little to do in space and when you've seen one star you've seen 'em all. And the first thing we had in school was a tour of the ship, which was all right.

We went in groups of twenty and it took all day–"day" by ship's time, I mean. The *Mayflower* was shaped like a ball with a cone on one side—top shaped. The point of the cone was her jet—although Chief Engineer Ortega, who showed us around, called it her "torch."

If you count the torch end as her stern, then the round end, her bow, was where the control room was located; around it were the Captain's cabin and the staterooms of the officers. The torch and the whole power plant space were cut off from the rest of the ship by a radiation shield that ran right through the ship. From the shield forward to the control room was a big cargo space. It was a cylinder more than a hundred feet in diameter and was split up into holds. We were carrying all sorts of things out to the colony —earth moving machinery, concentrated soil cultures, instruments, I don't know what all.

Wrapped around this central cylinder were the decks for living, "A" deck just inside the skin of the ship, "B" deck under it, and "C" deck just inside that, with "D" deck's ceiling being the outer wall of the cargo space. "D" deck was the mess rooms and galley and recreation rooms and sick bay and such; the three outer decks were bunk rooms and staterooms. "A" deck had steps in it every ten or fifteen feet because it was fitted into the outer curve of the ship; this made the ceilings in it of various heights. The furthest forward and furthest aft on "A" deck were only about six feet between floor and ceiling and some of the smaller kids lived in them, while at the greatest width of the ship the ceilings in "A" deck must have been twelve or thirteen feet high.

From inside the ship it was hard to see how it all fitted together. Not only was it all chopped up, but the artificial gravity we had from spinning the ship made directions confusing—anywhere you stood on a deck it seemed level, but it curved sharply up behind you and in front of you. But you never came to the curved part; if you walked forward it was still level. If you walked far enough you looped the loop and came back to where you started, having walked clear around the ship.

I never would have figured it out if Mr. Ortega hadn't drawn a sketch for us.

Mr. Ortega told us that the ship was spinning three and six-tenths revolutions per minute or two hundred and sixteen complete turns an hour, which was enough to give "B" deck a centrifugal force of one-third g. "B" deck was seventy-five feet out from the axis of the *Mayflower*; "A" deck where I lived was further out and you weighed maybe a tenth more there, while "C" deck caught about a tenth less.

"D" deck was quite a lot less and you could make yourself dizzy if you stood up suddenly in the mess room.

The control room was right on the axis; you could float in it even when the ship was spinning—or so they told me; I never was allowed inside.

Spinning the ship had another odd effect: all around us was "down." I mean to say that the only place you could put a view port was in the floor plates of "A" deck and that's where they were, four of them—big ones, each in its own compartment.

Mr. Ortega took us into one of these view galleries. The view port was a big round quartz plate in the floor, with a guard rail around it.

The first ones into the room went up to the guard rail and then backed away from it quick and two of the girls squealed. I pushed forward and got to the rail and looked down , . . and I was staring straight into the very bottom of the universe, a million trillion miles away and all of it down.

I didn't shy away—George says I'm more acrobat than acrophobe—but I did sort of grip the railing. Nobody wants to fall that far. The quartz was surface-treated so that it didn't give off reflections and it looked as if there were nothing at all between you and Kingdom Come.

The stars were reeling across the hole from the ship spinning, which made it worse. The Big Dipper came swinging in from the left, passed almost under me, and slid away to the right—and a few seconds later it was back again. I said, "This is where I came in," and gave up my place so that someone else could have a look, but nobody seemed anxious to.

Then we went through the hydroponics plant, but there wasn't anything fancy about that—just enough plants growing to replace the oxygen we used up breathing. Eel grass, it was mostly, but there was a vegetable garden as well. I wondered how they had gotten it going before they had the passengers aboard? Mr. Ortega pointed to a CO_2 fitting in the wall. "We had to subsidize them, of course."

I guess I should have known it; it was simple arithmetic.

The Chief led us back into one of the mess rooms, we sat down, and he told us about the power plant.

He said that there had been three stages in the development of space ships: first was the chemical fuel rocket ship that wasn't very different from the big German war rockets used in the Second World War, except that they were step rockets. "You kids are too young to have seen such rockets," he said, "but they were the biggest space ships ever built. They had to be big because they were terribly inefficient. As you all know, the first rocket to reach the Moon was a four-stage rocket. Its final stage was almost as long as the *Mayflower*—

yet its pay load was less than a ton.

"It is characteristic of space ship development that the ships have gotten smaller instead of bigger. The next development was the atom-powered rocket. It was a great improvement; steps were no longer necessary. That meant that a ship like the *Daedalus* could take off from Earth without even a catapult, much less step rockets, and cruise to the Moon or even to Mars. But such ships still had the shortcomings of rockets; they depended on an atomic power plant to heat up reaction mass and push it out a jet, just as their predecessors depended on chemical fuel for the same purpose.

"The latest development is the mass-conversion ship, such as the *Mayflower*, and it may be the final development—a mass-conversion ship is theoretically capable of approaching the speed of light. Take this trip: we accelerated at one gravity for about four hours and twenty minutes which brought us up to more than ninety miles a second. If we had held that drive for a trifle less than a year, we would approach the speed of light.

"A mass-conversion ship has plenty of power to do just that. At one hundred per cent efficiency, it would use up about one per cent of her mass as energy and another one per cent as reaction mass. That's what the Star Rover is going to do when it is finished."

One of the younger kids was waving his hand. "Mister Chief Engineer?"

"Yes, son?"

"Suppose it goes on a few weeks longer and passes the speed of light?"

Mr. Ortega shook his head. "It can't."

"Why not, sir?"

"Eh, how far have you gone in mathematics, sonny?"

"Just through grammer school calculus," the kid answered.

'Tm afraid there is no use in trying to explain it, then. Just take it from me that the big brains are sure it can't be done."

I had worried about that very point more than once. Why can't you go faster than light? I know all that old doubletalk about how the Einstein equations show that a speed faster than light is a meaningless quantity, like the weight of a song or the color of a sound, because it involves the square root of minus one—but all of that is just theory and if the course we had in history of science means anything at all, it means that scientists change their theories about as often as a snake changes his skin. I stuck up my hand.

"Okay," he says. "You with the cowlick. Speak up."

"Mr. Ortega, admitting that you can't pass the speed of light, what would happen if the Star Rover got up close to the speed of light—and then the Captain suddenly stepped the drive up to about six g and held it there?"

"Why, it would— No, let's put it this way—" He broke off and grinned; it made him look real young. "See here, kid, don't ask me questions like that. I'm an engineer with hairy ears, not a mathematical physicist." He looked thoughtful and added, "Truthfully, I don't know what would happen, but I would sure give a pretty to find out. Maybe we would find out what the square root of minus one looks like— from the inside."

He went on briskly, "Let's go on about the *Mayflower*. You probably know that when the original Star Rover failed to come back, the *Mayflower* was designed to be the Star Rover II, but the design was obsolete before they ever started putting her together. So they shifted the name over to the new intersteller ship, the Star Rover III, renamed this one the *Mayflower* and grabbed her for the colonial service.

"You kids should consider how lucky you are. Up to now, emigrants to Ganymede have had to spend two years and nine months in space, just to get there. You're making it in two months."

"Couldn't we go faster?" somebody wanted to know.

"We could," he told us. "But we don't need to and it runs up the astrogation and control difficulties. In these new ships the power plant has gotten 'way ahead of the instrumentation. Be patient; your grandchildren will make the trip in a week, blasting at one g all the way. There'll be so many ships they'll have to have traffic cops and maybe we can come close to shipping out as many people as there are extras bom each year.

"Enough about that," he went on. "Who here can tell me what 'E equals M C squared' means?"

I could have answered but I had already spoken up once and it doesn't do to get a reputation for apple polishing. Finally one of the older kids said, "It means that mass can be converted into energy."

"Right!" Mr. Ortega agreed. "The first real demonstration of that was the atom bomb they set off 'way back in 1945 at Alamogordo, New Mexico. That was a special case; they still didn't know how to control it; all they could do was to make one whale of a big bang. Then came the uranium power plants, but that still didn't amount to much because it was a very special case and only a microscopic percentage of the mass was converted into energy. It wasn't until Kilgore's energy transformation equations—don't worry about them; you'll study them when you are older if you are interested—it wasn't until Kilgore showed how it could be done that we had any idea of how to do what Dr. Einstein's energy-mass equation said, clear back in 1905.

"And we still didn't know how to control it. If we were going to turn mass into energy, we needed more mass with which to surround the reaction, a very special sort of mass that would not turn into energy when we didn't want it to and would hold the reaction where we wanted it. Ordinary metal wouldn't do; one might as well use soft butter.

"But the Kilgore equations showed how to do that, too, when they were read correctly. Now has anyone here any notion of how much energy you get when you convert a chunk of mass into raw energy?"

Nobody knew. "It's all in that one equation," he said, "good old Doc Einstein's 'E equals M C squared.' It comes out that one gram of mass gives nine times ten to the twentieth power ergs." He wrote it down for us: 1 gm. = 9 x 10^{20} ergs.

"Doesn't look like much, does it?" he said. "Now try it this way:" He wrote down

900,000,000,000,000,000,000 ergs.

"Read it off. Nine hundred thousand million billion ergs. It still doesn't mean much, does it? Figures like that are impossible to comprehend. The nuclear physicists keep a barrel of zeroes around handy the way a carpenter does a keg of nails.

"I’ll try once more," he went on. "A pound of mass, any old mass, say a pound of feathers, when converted into energy equals fifteen billion horsepower-hours. Does that give anyone a notion of why the *Mayflower* was assembled out in an orbit and will never ever land anywhere?"

"Too hot," somebody said.

"'Too hot' is an understatement. If the Mayftower had blasted off from Mojave space port the whole Los Angeles Borough of the City of Southern California would have been reduced to a puddle of lava and people would have been killed by radiation and heat from Bay City to Baja California. And that will give you an idea of why the shielding runs right through the ship between here and the power plant, with no way at all to get at the torch."

We had the misfortune to have Noisy Edwards along, simply because he was from the same bunk room. Now he spoke up and said, "Suppose you have to make a repair?"

"There is nothing to go wrong," explained Mr. Ortega. "The power plant has no moving parts of any sort"

Noisy wasn't satisfied. "But suppose something did go wrong, how would you fix it if you can't get at it?"

Noisy has an irritating manner at best; Mr. Ortega sounded a little impatient when he answered. "Believe me, son, even if you could get at it, you wouldn't want to. No indeed!"

"Humph!" said Noisy. "All I've got to say is, if there isn't any way to make a repair when a repair is needed, what's the use in sending engineer officers along?"

You could have heard a pin drop. Mr. Ortega turned red, but all he said was, "Why, to answer foolish questions from youngsters like yourself, I suppose." He turned to the rest of us. "Any more questions?"

Naturally nobody wanted to ask any then. He added, "I think that's enough for one session. School's out."

I told Dad about it later. He looked grim and said, "I'm afraid Chief Engineer Ortega didn't tell you the whole truth."

"Huh?"

"In the first place there is plenty for him to do in taking care of the auxiliary machinery on this side of the shield. But it is possible to get at the torch, if necessary."

"Huh? How?"

"There are certain adjustments which could conceivably have to be made in extreme emergency. In which case it would be Mr. Ortega's proud privilege to climb into a space suit, go outside and back aft, and make them."

"You mean——"

"I mean that the assistant chief engineer would succeed to the position of chief a few minutes later. Chief engineers are very carefully chosen, Bill, and not just for their technical knowledge."

It made me feel chilly inside; I didn't like to think about it.

7. Scouting in Space

Making a trip in a space ship is about the dullest way to spend time in the world, once the excitement wears off. There's no scenery, nothing to do, and no room to do it in. There were nearly six thousand of us crowded into the *Mayflower* and that doesn't leave room to swing a cat.

Take "B" deck—there were two thousand passengers sleeping in it. It was 150 feet across—fore and aft, mat is—and not quite 500 feet around, cylinder fashion. That gives about forty square feet per passenger, on the average, but a lot was soaked up in stairs, passageways, walls, and such. It worked out that each one had about room enough for his bunk and about that much left over to stand on when he wasn't sleeping.

You can't give a rodeo in that kind of space; you can't even get up a game of ring-around-the-rosy.

"A" deck was larger and "C" deck was smaller, being nearer the axis, but they averaged out the same. The council set up a staggered system to get the best use out of the galley and the mess rooms and to keep us from falling over each other in the 'freshers. "A" deck was on

Greenwich time; "B" deck was left on zone plus-eight time, or Pacific West Coast time; and "C" deck drew zone minus-eight time, Philippine time.

That would have put us on different days, of course, but the day was always figured officially on Greenwich time; the dodge was just to ease the pressure on eating facilities.

That was really all we had to worry about. You would wake up early, not tired but bored, and wait for breakfast Once breakfast was over, the idea was to kill time until lunch. All afternoon you could look forward to the terrific excitement of having dinner.

I have to admit that making us go to school was a good plan; it meant that two and a half hours every morning and every afternoon was taken care of. Some of the grown ups complained that the mess rooms and all the spare space was always crowded with classes, but what did they expect us to do? Go hang on sky hooks? We used up less space in class than if we had been under foot.

Still, it was a mighty odd sort of school. There were some study machines in the cargo but we couldn't get at them and there wouldn't have been enough to go around. Each class consisted of about two dozen kids and some adult who knew something about something. (You'd be surprised how many adults don't know anything about anything!) The grown up would talk about what he knew best and the kids would listen, then we would ask questions and he would ask questions. No real examinations, no experiments, no demonstrations, no stereos.

Dad says this is the best kind of a school, that a university consists of a log with a teacher on one end and a pupil on the other. But Dad is a sort of romantic.

Things got so dull that it was hardly worth while to keep up my diary, even if I had been able to get microfilm, which I wasn't.

Dad and I played an occasional game of cribbage in the evening—somehow Dad had managed to squeeze the board and a pack of cards into his weight allowance. Then he got too busy with technical planning he was doing for the council and didn't have time. Molly suggested that I teach her to play, so I did.

After that I taught Peggy to play and she pegged a pretty sharp game, for a girl. It worried me a little that I wasn't being loyal to Anne in getting chummy with Peg and her mother, but I decided that Anne would want me to do just what I did. Anne was always friendly with everybody.

It still left me with time on my hands. What with only one-third gravity and no exercise I couldn't sleep more than six hours a night. The lights were out eight hours but they didn't make us go to bed, not after the trouble they had with it the first week. I used to fool around the corridors after lights out, usually with Hank Jones, until we both would get sleepy. We talked a lot. Hank turned out not to be such a bad guy as long as you kept him trimmed down to size.

I still had my Scout suit with me and kept it folded up in my bunk. Hank came in one morning while I was making up my bunk and noticed it. "See here, William," he said, "why do you hang on to that? Let the dead past bury its dead."

"I don't know," I admitted. "Maybe there will be Scouting on Ganymede."

"Not that I ever heard of."

"Why not? There is Scouting on the Moon."

"Proves nothing," he answered.

But it got us to talking about it and Hank got a brilliant idea. Why not start up Scouting right now, in the *Mayflower*?

We called a meeting. Peggy spread the word around for us, through the junior council, and we set it for fifteen-thirty that same afternoon, right after school. Fifteen-thirty Greenwich, or "A" deck time, that is. That made it seven-thirty in the morning for the "B" deck boys and a half hour before midnight for the fellows on "C" deck. It was the best we could do. "B" deck could hurry through breakfast and get to the meeting if they wanted to and we figured that those who were really interested from "C" would stay up for the meeting.

I played my accordion while they were drifting in because Hank's father said that you needed music to warm up a meeting before it got down to work. The call had read "all Scouts and former Scouts;" by fifteen-forty we had them packed in and spilling into the corridors, even though we had the use of the biggest mess room. Hank called them to order and I put away my accordion and acted as Scribe pro tem, having borrowed a wire recorder from the Communications Officer for the purpose.

Hank made a little speech. I figure him for politics when he grows up. He said that all of us had enjoyed the benefits, the comradeship, and the honorable traditions of Scouting on Earth and it seemed a shame to lose them. He said that the Scouting tradition was the tradition of the explorer and pioneer and there could be no more fitting place and time for it than in the settlement of a new planet In fact the spirit of Daniel Boone demanded that we continue as Scouts.

I didn't know he had it in him. It sounded good.

He stopped and slipped me the wink. I got up and said that I wanted to propose a resolution. Then I read it—it had been a lot longer but we cut it down. It read: "Be it resolved—we the undersigned, Scouts and former Scouts of many jurisdictions and now passengers in the good ship *Mayflower*, having as our purpose to continue the Scouting tradition and to extend the Scouting trail out to the stars, do organize ourselves as the Boy Scouts of Ganymede in accordance with the principles and purpose of Scouting and in so doing do reaffirm the Scout Law."

Maybe it was flowery but it sounded impressive; nobody laughed. Hank said, "You have heard the resolution; what is your pleasure? Do I hear a second?"

He surely did; there were seconds all over the place. Then he asked for debate.

Somebody objected that we couldn't call ourselves the Boy Scouts of Ganymede because we weren't on Ganymede yet. He got a chilly reception and shut up. Then somebody else pointed out that Ganymede wasn't a star, which made that part about "Carrying the Scouting trail out to the stars" nonsense.

Hank told him that was poetic license and anyhow going out to Ganymede was a step in the right direction and that there would be more steps; what about the Star Rover III? That shut him up.

The worst objection was from "Millimetre" Muntz, a weary little squirt too big for his britches. He said, "Mr. Chairman, this is an outlaw meeting. You haven't any authority to set up a new Scouting jurisdiction. As a member in good standing of Troop -Ninety-Six, New Jersey, I object to the whole proceeding."

Hank asked him just what authority he thought Troop Ninety-Six, New Jersey, had out around the orbit of Mars? Somebody yelled, "Throw him out!"

Hank banged on the mess table. "It isn't necessary to throw him out —but, since Brother Millimetre thinks this is not a proper meeting, then it isn't proper for him to take part in it. He is excused and the chair will recognize him no further. Are you ready to vote?"

It was passed unanimously and then Hank was elected organizational chairman. He appointed a flock of committees, for organization and for plans and programs and for credentials and tests and for liaison, and such. That last was to dig out the men in the ship who had been troop masters and commissioners and things and get a Court of Honor set up. There were maybe a dozen of the men passengers at the meeting, listening. One of them, a Dr. Archibald who was an aide on "A" deck, spoke up.

"Mr. Chairman, I was a Scoutmaster in Nebraska. I'd like to volunteer my services to this new organization."

Hank looked him straight in the eye. "Thank you, sir. Your application will be considered."

Dr. Archibald looked startled, but Hank went smoothly on, "We want and need and will appreciate the help of all you older Scouts. The liaison committee is instructed to get the names of any who are willing to serve."

It was decided that we would have to have three troops, one for each deck, since it wasn't convenient to try to meet all at the same time. Hank asked all the Explorer Scouts to stand up. There were too many of them, so he asked those who were Eagles to remain standing. There were about a dozen of us.

Hank separated us Eagles by decks and told us to get busy and organize our troops and to start by picking an acting senior patrol leader. "A" deck had only three Eagles, me, Hank, and a kid from another bunk room whom I hadn't met before, Douglas MacArthur Okajima. Doug and Hank combined on me and I found myself tagged with the job.

Hank and I had planned to finish the meeting with setting up exercises, but there just wasn't room, so I got out my accordion again and we sang The Scouting Trail and followed it with The Green Hills of Earth. Then we took the oath together again:

"Upon my honor I will do my best to do my duty to God and my planet, and to keep myself physically fit, mentally alert, and morally straight."

After that the meeting busted up.

For a while we held meetings every day. Between troop meetings and committee meetings and Explorer meetings and patrol leader meetings we didn't have time to get bored. At first the troops were just "A" troop, "B" troop, and "C" troop, after the decks, but we wanted names to give them some personality. Anyhow I wanted a name for my troop; we were about to start a membership drive and I wanted something with more oomph to it than "'A'" deck troop."

Somebody suggested "The Space Rats" but that was voted down, and somebody else suggested "The *Mayflower*s"; they didn't bother to vote on that; they simply sat on him.

After that we turned down "The Pilgrims," "Deep Space Troop," "Star Rovers," and "Sky High." A kid named John Edward Forbes-Smith got up. "Look," he said, "we're divided into three troops on the basis of the time zones we use, aren't we? "B" deck has California time; "C" deck has Philippine time; and we have Greenwich or English time. Why don't we pick names that will show that fact? We could call ourselves the Saint George Troop."

Bud Kelly said it was a good idea as far as it went but make it Saint Patrick instead of Saint George; after all, Dublin was on Greenwich time, too, and Saint Patrick was a more important saint.

Forbes-Smith said, "Since when?"

Bud said, "Since always, you limey—" So we sat on both of them, too, and it was decided not to use saints. But Johnny Edwards had a good idea, just the same; we settled on the Baden-Powell Troop, Boy Scouts of Ganymede, which tied in with the English time zone and didn't offend anybody.

The idea took hold; "C" deck picked Aguinaldo as a name and "B" deck called themselves the Junipero Serra Troop. When I heard that last I was kind of sorry our deck didn't have California time so that we could have used it. But I got over it; after all "Baden-Powell" is a mighty proud name, too.

For that matter they were all good names—scouts and explorers and brave men, all three of them. Two of them never had a chance to be Scouts in the narrow, organized meaning, but they were all Scouts in the wider sense—like Daniel Boone.

Dad says there is a lot in a name.

As soon as they heard about what we were doing the girls set up Girl Scouting, too, and Peggy was a member of the Florence Nightingale Troop. I suppose there was no harm in it, but why do girls copy what the boys do? We were too busy to worry about them, though; we had to revamp Scouting activities to fit new conditions.

We decided to confirm whatever ranks and badges a boy had held in his former organization—permanent rankings, I mean, not offices. Having been a patrol leader or a scribe didn't mean anything, but if you were an Eagle on Earth, you stayed one in the B.S.G.; if you were a Cub, then you were still a Cub. If a boy didn't have records—and about half of them didn't— we took his Scout oath statement as official.

That was simple; working over the tests and the badges was complicated. After all you can't expect a boy to pass beekeeping when you haven't any bees.

(It turned out that there were several swarms of bees sleep-frozen in the cargo, but we didn't have the use of them.)

But we could set up a merit badge in hydroponics and give tests right there in the ship. And Mr. Ortega set up a test for us in spaceship engineering and Captain Harkness did the same for ballistics and astrogation. By the end of the trip we had enough new tests to let a boy go up for Eagle Scout, once we had a Court of Honor.

That came last. For some reason I couldn't figure Hank had kept putting off the final report of the liaison committee, the committee which had as its job getting Scout Masters and Commissioners and such. I asked him about it, but he just looked mysterious and said that I would see.

I did see, eventually. At last we had a joint meeting of all three troops to install Scout Masters and dedicate the Court of Honor and such. And from then on the adults ran things and we went back to being patrol leaders at the most. Oh well—it was fun while it lasted.

8. Trouble

When we were fifty-three days out and about a week to go to reach Ganymede, Captain Harkness used the flywheel to precess the ship so that we could see where we were going—so that the passengers could see, that is; it didn't make any difference to his astrogation.

You see, the axis of the *Mayflower* had been pointed pretty much toward Jupiter and the torch had been pointed back at the Sun. Since the view ports were spaced every ninety degrees around the sides, while we had been able to see most of the sky, we hadn't been able to see ahead to Jupiter nor behind to the Sun. Now he tilted the ship over ninety degrees and we were rolling, so to speak, along our line of flight. That way, you could see Jupiter and the Sun both, from any view port, though not both at the same time.

Jupiter was already a tiny, ruddy-orange disc. Some of the boys claimed they could make out the moons. Frankly, I couldn't, not for the first three days after the Captain precessed the ship. But it was mighty fine to be able to see Jupiter.

We hadn't seen Mars on the way out, because Mars happened to be on the far side of the Sun, three hundred million miles away. We hadn't seen anything but the same old stars you can see from Earth. We didn't even see any asteroids.

There was a reason for that. When we took off from the orbit of Supra-New-York, Captain Harkness had not aimed the *Mayflower* straight for where Jupiter was going to be when we got there; instead he had lifted her north of the ecliptic high enough to give the asteroid belt a wide berth. Now anybody knows that meteors are no real hazard in space. Unless a pilot does deliberately foolish things like driving his ship through the head of a comet it is almost impossible to get yourself hit by a meteor. They are too far between.

On the other hand the asteroid belt has more than its fair share of sky junk. The older power-pile ships used to drive straight through the belt, taking their chances, and none of them was ever hit to amount to anything. But Captain Harkness, having literally all the power in the world, preferred to go around and play it safe. By avoiding the belt there wasn't a chance in a blue moon that the *Mayflower* would be hit.

Well, it must have been a blue moon. We were hit.

It was just after reveille, "A" deck time, and I was standing by my bunk, making it up. I had my Scout uniform in my hands and was about to fold it up and put it under my pillow. I still didn't wear it. None of the others had uniforms to wear to Scout meetings so I didn't wear mine. But I still kept it tucked away in my bunk.

Suddenly I heard the goldarnest noise I ever heard in my life. It sounded like a rifle going off right by my ear, it sounded like a steel door being slammed, and it sounded like a giant tearing yards and yards of cloth, all at once.

Then I couldn't hear anything but a ringing in my ears and I was dazed. I shook my head and looked down and I was staring at a raw hole in the ship, almost between my feet and nearly as big as my fist.

There was scorched insulation around it and in the middle of the hole I could see blackness—then a star whipped past and I realized that I was staring right out into space.

There was a hissing noise.

I don't remember thinking at all. I just wadded up my uniform, squatted down, and stuffed it in the hole. For a moment it seemed as if the suction would pull it on through the hole, then it jammed and stuck and didn't go any further. But we were still losing air. I think that was the point at which I first realized that we were losing air and that we might be suffocated in vacuum.

There was somebody yelling and screaming behind me that he was killed and alarm bells were going off all over the place. You couldn't hear yourself think. The airtight door to our bunk room slid across automatically and settled into its gaskets and we were locked in.

That scared me to death.

I know it has to be done. I know that it is better to seal off one compartment and kill the people who are in it than to let a whole ship die—but, you see, I was in that compartment, personally. I guess I'm just not the hero type.

I could feel the pressure sucking away at the plug my uniform made. With one part of my mind I was recalling that it had been advertised as "tropical weave, self ventilating" and wishing that it had been a solid plastic rain coat instead. I was afraid to stuff it in any harder, for fear it would go all the way through and leave us sitting there, chewing vacuum. I would have passed up desserts for the next ten years for just one rubber patch, the size of my hand.

The screaming had stopped; now it started up again. It was Noisy Edwards, beating on the airtight door and yelling, "Let me out of here! Get me out of here!"

On top of that I could hear Captain Harkness's voice coming through the bull horn. He was saying,

"H-twelve! Report! H-twelve! Can you hear me?"

On top of that everybody was talking at once.

I yelled: "Quiet!" at the top of my voice—and for a second or so there was quiet.

Peewee Brunn, one of my Cubs, was standing in front of me, looking big-eyed. "What happened, Billy?" he said.

I said, "Grab me a pillow off one of the bunks. Jump!"

He gulped and did it. I said, "Peel off the cover, quick!"

He did, making quite a mess of it, and handed it to me—but I didn't have a hand free. I said, "Put it down on top of my hands."

It was the ordinary sort of pillow, soft foam rubber. I snatched one hand out and then the other, and then I was kneeling on it and pressing down with the heels of my hands. It dimpled a little in the middle and I was scared we were going to have a blowout right through the pillow. But it held. Noisy was screaming again and Captain Harkness was still asking for somebody, anybody, in compartment H-12 to tell him what was going on. I yelled "Quiet!" again, and added, "Somebody slug Noisy and shut him up."

That was a popular idea. About three of them jumped to it. Noisy got clipped in the side of the neck, then somebody poked him in the pit of his stomach and they swarmed over him. "Now everybody keep quiet," I said, "and keep on keeping quiet. If Noisy lets out a peep, slug him again," I gasped and tried to take a deep breath and said, "H-twelve, reporting!"

The Captain's voice answered, "What is the situation there?"

"There is a hole in the ship, Captain, but we got it corked up."

"How? And how big a hole?"

I told him and that is about all there was to it. They took a while to get to us because—I found this out afterward—they isolated that stretch of corridor first, with the airtight doors, and that meant they had to get everybody out of the rooms on each side of us and across the passageway. But presently two men in space suits opened the door and chased all the kids out, all but me. Then they came back. One of them was Mr. Ortega. "You can get up now, kid," he said, his voice sounding strange and far away through his helmet. The other man squatted down and took over holding the pillow in place.

Mr. Ortega had a big metal patch under one arm. It had sticky padding on one side. I wanted to stay and watch him put it on but he chased me out and closed the door. The corridor outside was empty but I banged on the airtight door and they let me through to where the rest were waiting. They wanted to know what was happening but I didn't have any news for them because I had been chased out.

After a while we started feeling light and Captain Harkness announced that spin would be off the ship for a short time. Mr. Ortega and the other man came back and went on up to the control room. Spin was off entirely soon after that and I got very sick. Captain Harkness kept the ship's speaker circuits cut in on his conversations with the men who had gone outside to repair the hole, but I didn't listen. I defy anybody to be interested in anything when he is drop sick

Then spin came back on and everything was all right and we were allowed to go back into our bunkroom. It looked just the same except that there was a plate welded over the place where the meteorite had come in.

Breakfast was two hours late and we didn't have school that morning.

That was how I happened to go up to Captain's mast for the second time. George was there and Molly and Peggy and Dr. Archibald, the Scoutmaster of our deck, and all the fellows from my bunk room and all the ship's officers. The rest of the ship was cut in by visiplate. I wanted to wear my uniform but it was a mess—torn and covered with sticky stuff. I finally cut off the merit badges and put it in the ship's incinerator.

The First Officer shouted, "Captain's Mast for punishments and rewards!" Everybody sort of straightened up and Captain Harkness walked out and faced us. Dad shoved me forward.

The Captain looked at me. "William Lermer?" he said.

I said, "Yessir."

He said, "I will read from yesterday's log: 'On twenty-one August at ohseven-oh-four system standard, while cruising in free fall according to plan, the ship was broached by a small meteorite. Safety interlocks worked satisfactorily and the punctured volume, compartment H-twelve, was isolated with no serious drop in pressure elsewhere in the ship.

" 'Compartment H-twelve is a bunk room and was occupied at the time of the emergency by twenty passengers. One of the passengers, William J. Lermer, contrived a makeshift patch with materials at hand and succeeded in holding sufficient pressure for breathing until a repair party could take over.

" 'His quick thinking and immediate action unquestionably saved the lives of all persons in compartment H-twelve.' "

The Captain looked up from the log and went on, "A certified copy of this entry, along with depositions of witnesses, will be sent to Interplanetary Red Cross with recommendation for appropriate action. Another copy will be furnished you. I have no way to reward you except to say that you have my heartfelt gratitude. I know that I speak not only for the officers but for all the passengers and most especially for the parents of your bunk mates."

He paused and waggled a finger for me to come closer. He went on in a low voice, to me alone, "That really was a slick piece of work. You were on your toes. You have a right to feel proud."

I said I guessed I had been lucky.

He said, "Maybe. But that sort of luck comes to the man who is prepared for it."

He waited a moment, then said, "Lermer, have you ever thought of putting in for space training?"

I said I suppose I had but I hadn't thought about it very seriously. He said, "Well, Lermer, if you ever do decide to, let me know. You can reach me care of the Pilots' Association, Luna City."

With that, mast was over and we went away, George and I together and Molly and Peggy following along. I heard Peggy saying, "That's my brother."

Molly said, "Hush, Peggy. And don't point."

Peggy said, "Why not? He is my brother—well, isn't he?"

Molly said, "Yes, but there's no need to embarrass him."

But I wasn't embarrassed.

Mr. Ortega looked me up later and handed me a little, black, twisted piece of metal, about as big as a button. "That's all there was left of it," he said, "but I thought you would like to have it—pay you for messing up your Scout suit, so to speak."

I thanked him and said I didn't mind losing the uniform; after all, it had saved my neck, too. I looked at the meteorite. "Mr. Ortega, is there any way to tell where this came from?"

"Not really," he told me, "though you can get the scientific johnnies to cut it up and then express an opinion—if you don't mind them destroying it."

I said no, I'd rather .keep it—and I have; I've still got it as a pocket piece. He went on, "It's either a bit of a comet or a piece of the Ruined Planet. We can't tell which because where we were there shouldn't have been either one."

"Only there was," I said.

"As you say, there was."

"Uh, Mr. Ortega, why don't they put enough armor on a ship to stop a little bitty thing like this?" I remembered what the skin of the ship looked like where it had been busted; it seemed awful thin.

"Well, now, in the first place, this meteor is a real giant, as meteors go. In the second place—do you know anything about cosmic rays, Bill?"

"Uh, not much, I guess."

"You undoubtedly know that the human body is transparent to primary cosmic radiation and isn't harmed by it. That is what we encounter out here in space. But metal is not completely transparent to it and when it passes through metal it kicks up all sorts of fuss—secondary and tertiary and quaternary cosmic radiation. The stuff cascades and it is not harmless, not by a darn sight. It can cause mutations and do you and your descendants a lot of harm. It adds up to this: a man is safest in space when he has just enough ship around him to keep the air in and ultraviolet out."

Noisy didn't have much to say around the compartment for the next couple of days and I thought maybe he had learned his lesson. I was wrong. I ran into him in one of the lower passageways when there was nobody else around. I started to go around him but he stepped in my way. "I want to talk to you," he said.

"Okay," I answered. "What's on your mind?" "You think you're pretty smart, don't you?" I didn't like the way he said it, nor what he said. I said, "I don't think I'm smart; I am smart." He made me tired.

"Pretty cocky, aren't you? You think I ought to be kissing your hand and telling you how grateful I am for saving my life, don't you?"

I said, "Oh, yeah? If that's what is worrying you, you can just skip it; I didn't do it for you."

"I know that," he answered," and I'm not grateful, see?"

"That's fine with me," I told him. "I wouldn't want a guy like you being grateful to me."

He was breathing hard. "I've had just about enough of you," he said slowly. And the next thing I knew I had a mouthful of knuckles and I was down.

I got up cautiously, trying to surprise him. But it was no good; he knocked me down again. I tried to kick him while I was down, but he danced out of my way.

The third time he hit me I stayed down. When I quit seeing stars he was gone—and I hadn't managed to lay a finger on him. I never was any good in a fight; I'm still talking when I ought to be slugging.

I went to a scuttlebutt and bathed my face. Hank ran across me there and asked me what in the world I had been doing. I told him I had run into a door. I told Dad the same thing.

Noisy didn't bother me any more and we never had anything to say to each other again. I lay awake a long time that night, trying to figure it out. I didn't get it. The chap who thought up that malarkey about "my strength is as the strength of ten because my heart is pure" certainly had never met Noisy Edwards. For my taste Noisy was a no good so-and-so and I wished I had been able to use his face to stuff the hole the meteor made. I thought about a number of ways to fix him, but none of them was any good. As Dad says, sometimes there just isn't any cure for a situation.

9. The Moons of Jupiter

Nothing much happened until it was time to make our approach to Jupiter, except that a four-year-old kid turned up missing. The kid's parents searched all around and they passed the word from the control room for everybody to keep an eye open but they still couldn't find him.

So we had a chance to try out the Scouts' emergency organization. The ship's officers couldn't search the ship, since there was just the Captain and two watch officers and Mr. Ortega and his assistant chief. Captain Harkness supplied plans to each of the Scoutmasters and we went through that ship like a kid searching his clothes for a half credit. We turned the kid up, all right, in about twenty minutes. Seems the little devil had snuck into the hydroponics room while it was being serviced and had got himself locked in.

While he was in there he had got thirsty and had tried to drink the solutions they raise the plants in–had drunk some, in fact. The result was just about what you would expect. It didn't do him any real harm but, boy, was that place a mess!

I was talking to Dad about it that night over a game. Peggy had a Girl Scout meeting and Molly was off somewhere; we were alone for once. The baby's mother had raised particular Ned, just as if there had really been something wrong—I mean, what can happen in a space ship? The kid couldn't fall overboard.

Dad said her reaction was perfectly natural.

I said, "See, here, George, does it seem to you that some of the emigrants don't have what it takes to be colonists?"

"Mmmm .. . possibly."

I was thinking of Noisy but the ones I mentioned were Mrs. Tarbutton, who gave up and didn't even come along, and that female —Mrs. Grigsby—who got in trouble and had to wash dishes. And another fellow named Saunders who was continually in trouble with the council for trying to live his own life, wild and free, no matter what it did to the rest of us. "George, how did those characters get past the psycho tests?"

George stopped to peg fifteen-four, then said, "Bill, haven't you ever heard of political influence?"

All I said was, "Huh?"

"It's a shocking thought I know, but you are old enough to get used to the world as it is, instead of the way it ought to be. Take a hypothetical case: I don't suppose that a niece of a state councilor would be very likely to fail the psycho tests. Oh, she might fail the first tests, but a review board might find differently–if the councilor really wanted her to pass."

I chewed this over a while. It did not sound like George; he isn't the cynical type. Me, I'm cynical, but George is usually naive. "In that case, George, there is no use in having psycho tests at all, not if people like that can sneak past."

"Contrariwise. The tests are usually honest. As for those who sneak past, it doesn't matter. Old Mother Nature will take care of them in the long run. Survivors survive." He finished dealing and said, "Wait till you see what I'm going to do to you this hand. You haven't a chance."

He always says that. I said, "Anybody who would use public office like that ought to be impeached!"

George said mildly, "Yep. But don't bum out your jets, son; we've got human beings, not angels, to work with."

On the twenty-fourth of August Captain Harkness took spin off and started bringing us in. We decelerated for better than four hours and then went into free fall about six hundred thousand miles out from Jupiter and on the opposite side from where Ganymede was then. Weightlessness still wasn't any fun but this time we were ready and everyone got shots for it who wanted them. I took mine and no nonsense.

Theoretically the *Mayflower* could have made it in one compound maneuver, ending up at the end of deceleration in a tight circular orbit around Ganymede. Practically it was much better to sneak in easy and avoid any more trouble with meteorites—with the "false rings," that is.

Of course Jupiter doesn't have rings like Saturn, but it does have quite a lot of sky junk traveling around in the same plane as its moons. If there were enough of it, it would show up like Saturn's rings. There isn't that much, but there is enough to make a pilot walk on eggs coming in. This slow approach gave us a fine front seat for a tour of Jupiter and its satellites.

Most of this stuff we were trying to avoid is in the same plane as Jupiter's equator, just the way Saturn's rings are—so Captain Harkness brought us in over the top of Jupiter, right across Jupiter's north pole. That way, we never did get in the danger zone until we had curved down on the other side to reach Ganymede—and by then we were going fairly slow.

But we weren't going slow when we passed over Jupiter's north pole, no indeedy! We were making better than thirty miles a second and we were close in, about thirty thousand miles. It was quite a sight.

Jupiter is ninety thousand miles thick; thirty thousand miles is close—too close for comfort.

I got one good look at it for about two minutes from one of the view ports, then had to give up my place to somebody who hadn't had a turn yet and go back to the bunk room and watch through the vision screen. It was an odd sight; you always think of Jupiter with equatorial bands running parallel across it. But now we were looking at it end on and the bands were circles. It looked like a giant archery target, painted in orange and brick red and brown— except that half of it was chewed away. We saw it in half moon, of course.

There was a dark spot right at the pole. They said that was a zone of permanent clear weather and calm and that you could see clear down to the surface there. I looked but I couldn't see anything; it just looked dark.

As we came over the top, Io—that's satellite number one— suddenly came out of eclipse. Io is about as big as the Moon and was about as far away from us at the time as the Moon is from the Earth, so it looked about Moon size. There was just black sky and then there was a dark, blood red disc and in less than five minutes it was brilliant orange, about the color of Jupiter itself. It simply popped up, like magic.

I looked for Barnard's satellite while we were close in, but missed it. It's the little one that is less than one diameter from the surface of Jupiter—so close that it whirls around Jupiter in twelve hours. I was interested in it because I knew that the Jovian observatory was on it and also the base for Project Jove.

I probably didn't miss anything; Barnard's satellite is only about a hundred and fifty miles in diameter. They say a man can come pretty close to jumping right off it. I asked George about it and he said, no, the escape speed was about five hundred feet per second and who had been filling me up with nonsense?

I looked it up later; he was right. Dad is an absolute mine of useless information. He says a fact should be loved for itself alone.

Callisto was behind us; we had passed her on the way in, but not very close. Europa was off to the right of our course nearly ninety degrees; we saw her in half moon. She was more than four hundred thousand miles away and was not as pretty a sight as the Moon is from Earth.

Ganymede was straight ahead, almost, and growing all the time—and here was a funny thing; Callisto was silvery, like the Moon, but not as bright; Io and Europa were bright orange, as bright as Jupiter itself. Ganymede was downright dull!

I asked George about it; he came through, as usual "Ganymede used to be about as bright as Io and Europa," he told me. "It's the greenhouse effect—the heat trap. Otherwise we wouldn't be able to live on it."

I knew about that, of course; the greenhouse effect is the most important part of the atmosphere project When the 1985 expedition landed Ganymede had a surface temperature a couple of hundred degrees below zero—that's cold enough to freeze the milk of human kindness! "But look, George," I objected, "sure, I know about the heat trap, but why is it so dark? It looks like the inside of a sack."

"Light is heat; heat is light," he answered. "What's the difference? It's not dark on the ground; it goes in and doesn't come out—and a good thing, too."

I shut up. It was something new to me and I didn't understand it, so I decided to wait and not pound my teeth about it.

Captain Harkness slowed her down again as we came up to Ganymede and we got in one good meal while she was under drive. I never did get so I could eat at free fall, even with injections. He leveled her off in a tight circular orbit about a thousand miles up from Ganymede. We had arrived—just as soon as we could get somebody to come and get us.

It was on the trip down to Ganymede's surface that I began to suspect that being a colonist wasn't as glamorous and romantic as it had seemed back on Earth. Instead of three ships to carry us all at once, there was just one ship, the Jitterbug, and she would have fitted into one of the *Bifrost*'s compartments. She could carry only ninety of us at a time and that meant a lot of trips.

I was lucky; I had to wait only three days in free fall. But I lost ten pounds.

While I waited, I worked, helping to stow the freight that the Jitterbug brought up each trip. At last it came our turn and we piled into the Jitterbug. She was terrible; she had shelves rather than decks—they weren't four feet apart. The air was stale and she hadn't been half way cleaned up since the last trip. There weren't individual acceleration couches; there were just pads covering the deck space and we covered the pads, shoulder to shoulder—and foot in your eye, for that matter.

The skipper was a loudmouthed old female they called "Captain Hattie" and she kept bawling us out and telling us to hurry. She didn't even wait to make sure that we were all strapped down.

Fortunately it didn't take very long. She drove away so hard that for the first time except in tests I blacked out, then we dropped for about twenty minutes; she gunned her again, and we landed with a terrible bump. And Captain Hattie was shouting, "Out you come, you ground hogsl This is it."

The Jitterbug carried oxygen, rather than the helium-oxygen mix of the *Mayflower*. We had come down at ten pounds pressure; now Captain Hattie spilled the pressure and let it adjust to Ganymede normal, three pounds. Sure, three pounds of oxygen is enough to live on; that's all Earth has—the other twelve pounds are nitrogen. But a sudden drop in pressure like that is enough to make you gasp anyhow. You aren't suffocating but you feel as if you were.

We were miserable by the time we got out and Peggy had a nose bleed. There weren't any elevators; we had to climb down a rope ladder. And it was cold!

It was snowing; the wind was howling around us and shaking the ladder—the smallest kids they had to lower with a line. There was about eight inches of snow on the ground except where the splash of the Jitterbugs jet had melted it. I could hardly see, the wind was whipping the snow into my face so, but a man grabbed me by the shoulder, swung me around, and shouted, "Keep moving! Keep moving! Over that way."

I headed the way he pointed. There was another man at the edge of the blast clearing, singing the same song, and there was a path through the snow, trampled to slush. I could see some other people disappearing in the snow ahead and I took out after them, dogtrotting to keep warm.

It must have been half a mile to the shelter and cold all the way. We weren't dressed for it. I was chilled through and my feet were soaking wet by the time we got inside.

The shelter was a big hangarlike building and it was not much warmer, the door was open so much, but it was out of the weather and it felt good to be inside. It was jammed with people, some of them in ship suits and some of them Ganymedeans—you couldn't miss the colonial men; they were bearded and some of them wore their hair long as well. I decided that was one style I was not going to copy; I'd be smooth shaven, like George.

I went scouting around, trying to find George & Co. I finally did. He had found a bale of something for Molly to sit on and she was holding Peggy on her lap. Peg's nose had stopped bleeding. I was glad to see, but there were dried tears and blood and dirt on her face. She was a sight.

George was looking gloomy, the way he did the first few days without his pipe. I came up and said, "Hi, folks!"

George looked around and smiled and said, "Well, Bill, fancy meeting you here! How is it going?"

"Now that you ask me," I answered, "it looks like a shambles."

He looked gloomy again and said, "Oh, I suppose they will get things straightened out presently."

We didn't get a chance to discuss it. A colonist with snow on his boots and hair on his face stopped near us, put his little fingers to his lips, and whistled. "Pipe down!" he shouted. "I want twelve able-bodied men and boys for the baggage party." He looked around and started pointing. "You—and you—and you—"

George was the ninth "You"; I was the tenth.

Molly started to protest. I think George might have balked if she had not. Instead he said, "No, Molly, I guess it has to be done. Come on, Bill."

So we went back out into the cold.

There was a tractor truck outside and we were loaded in it standing up, then we lumbered back to the rocket site. Dad saw to it that I was sent up into the Jitterbug to get me out of the weather and I was treated to another dose of Captain Hattie's tongue; we couldn't work fast enough to suit her. But we got our baggage lowered finally; it was in the truck by the time I was down out of the ship. The trip back was cold, too.

Molly and Peggy were not where we had left them. The big room was almost empty and we were told to go on into another building through a connecting door. George was upset, I could see, from finding Molly gone.

In the next building there were big signs with arrows: MEN & BOYS-TO THE RIGHT and WOMEN & GIRLS-TO THE LEFT. George promptly turned to the left. He got about ten yards and was stopped by a stem-faced woman dressed like a colonial, in a coverall. "Back the other way," she said firmly. "This is the way to the ladies' dormitory."

"Yes, I know," agreed Dad, "but I want to find my wife."

"You can look for her at supper."

"I want to see her now."

"I haven't any facilities for seeking out any one person at this time. You'll have to wait."

"But—" There were several women crowding past us and going on inside. Dad spotted one from our deck in the *Mayflower*. "Mrs. Archibald!"

She turned around. "Oh—Mr. Lermer. How do you do?"

"Mrs. Archibald," Dad said intently, "could you find Molly and let her know that I'm waiting here?"

"Why, I'd be glad to try, Mr. Lermer."

"Thanks, Mrs. Archibald, a thousand thanks!"

"Not at all." She went away and we waited, ignoring the stern-faced guard. Presently Molly showed up without Peggy. You would have thought Dad hadn't seen her for a month.

"I didn't know what to do, dear," she said. "They said we had to come and it seemed better to get Peggy settled down. I knew you would find us."

"Where is Peggy now?"

"I put her to bed."

We went back to the main hall. There was a desk there with a man behind it; over his head was a sign: IMMIGRATION SERVICE-INFORMATION. There was quite a line up at it; we took our place in the queue.

"How is Peggy?" Dad asked.

"I'm afraid she is catching a cold."

"I hope-" Dad said. "Ah, I HOPE-Atchoo!"

"And so are you," Molly said accusingly.

"I don't catch cold," Dad said, wiping his eyes. "That was just a reflex."

"Hmm—" said Molly.

The line up took us past a low balcony. Two boys, my age or older, were leaning on the rail and looking us over. They were colonials and one was trying to grow a beard, but it was pretty crummy.

One turned to the other and said, "Rafe, will you look at what they are sending us these days?"

The other said, "It's sad."

The first one pointed a thumb at me and went on, "Take that one, now—the artistic type, no doubt."

The second one stared at me thoughtfully. "Is it alive?" he asked.

"Does it matter?" the first one answered.

I turned my back on them, whereupon they both laughed. I hate self-panickers.

10. The Promised Land

Mr. Saunders was ahead of us in line. He was crabbing about the weather. He said it was an outrage to expose people the way we had been. He had been with us on the working party, but he had not worked much.

The man at the desk shrugged. "The Colonial Commission set your arrival date; we had nothing to say about it. You can't expect us to postpone winter to suit your convenience."

"Somebody's going to hear about this!"

"By all means." The man at the desk handed him a form, "Next, please!" He looked at Dad and said, "What may I do for you, citizen?"

Dad explained quietly that he wanted to have his family with him. The man shook his head. "Sorry. Next case, please."

Dad didn't give up his place. "You can't separate a man and wife. We aren't slaves, nor criminals, nor animals. The Immigration Service surely has some responsibilities toward us."

The man looked bored. "This is the largest shipload we've ever had to handle. We've made the best arrangements we could. This is a frontier town, not the Astor."

"All I'm asking for is a minimum family space, as described in the Commission's literature about Ganymede."

"Citizen, those descriptions are written back on Earth. Be patient and you will be taken care of."

"Tomorrow?”

"No, not tomorrow. A few days—or a few weeks."

Dad exploded. "Weeks, indeed! Confound it, I'll build an igloo out on the field before I'll put up with this."

"That's your privilege." The man handed Dad a sheet of paper. "If you wish to lodge a complaint, write it out on this."

Dad took it and I glanced at it. It was a printed form—and it was addressed to the Colonial Commission back on Earth! The man went on, "Turn it in to me any time this phase and it will be ultramicrofilmed in time to go back with the mail in the *Mayflower*."

Dad looked at it, snorted, crumpled it up, and stomped away.

Molly followed him and said, "George! Georgel Don't be upset. We'll live through it."

Dad grinned sheepishly. "Sure we will, honey. It's the beauty of the system that gets me. Refer all complaints to the head office—half a billion miles away!"

The next day George's reflexes were making his nose run. Peggy was worse and Molly was worried about her and Dad was desperate. He went off somewhere to raise a stink about the way things were being handled.

Frankly, I didn't have it too bad. Sleeping in a dormitory is no hardship to me; I could sleep through the crack of doom. And the food was everything they had promised.

Listen to this: For breakfast we had corn cakes with syrup and real butter, little sausages, real ham, strawberries with cream so thick I didn't know what it was, tea, all the milk you could drink, tomato juice, honeydew melon, eggs—as many eggs as you wanted.

There was an open sugar bowl, too, but the salt shaker had a little sign on it; DON'T WASTE THE SALT.

There wasn't any coffee, which I wouldn't have noticed if George had not asked for it. There were other things missing, too, although I certainly didn't notice it at the time. No tree fruits, for example—no apples, no pears, no oranges. But who cares when you can get strawberries and watermelon and pineapples and such? There were no tree nuts, too, but there were peanuts to burn.

Anything made out of wheat flour was a luxury, but you don't miss it at first.

Lunch was choice of corn chowder or jellied consomme, cheese souffle, fried chicken, corned beef and cabbage, hominy grits with syrup, egg plant au gratin, little pearl onions scalloped with cucumbers, baked stuffed tomatoes, sweet potato surprise, German-fried Irish potatoes, tossed endive, coleslaw with sour cream, pineapple and cottage cheese with lettuce. Then there was peppermint ice cream, angel berry pie, frozen egg nog, raspberry ice, and three kinds of pudding—but I didn't do too well on the desserts. I had tried to try everything, taking a little of this and a dab of that, and by the time desserts came along I was short on space. I guess I ate too much.

The cooking wasn't fancy, about like Scout camp, but the food was so good you couldn't ruin it. The service reminded me of camp, too—queueing up for servings, no table cloths, no napkins. And the dishes had to be washed; you couldn't throw them away or burn them—they were imported from Earth and worth their weight in uranium.

The first day they took the first fifty kids in the chow line and the last fifty lads to leave the mess hall and made them wash dishes. The next day they changed pace on us and took the middle group. I got stuck both times.

The first supper was mushroom soup, baked ham, roast turkey, hot corn bread with butter, jellied cold meats, creamed asparagus, mashed potatoes and giblet gravy, spinach with hard boiled egg and grated cheese, corn pudding, creamed peas and carrots, smothered lettuce and three kinds of salad. Then there was frozen custard and raisin pudding with hard sauce and Malaga and Thompson grapes and more strawberries with powdered sugar.

Besides that you could drop around to the kitchen and get a snack any time you felt like it.

I didn't go outside much the first three days. It snowed and although we were in Sun phase when we got there it was so murky that you couldn't see the Sun, much less Jupiter. Besides, we were in eclipse part of the time. It was as cold as Billy-be-switched and we still didn't have any cold weather clothes.

I was sent along with the commissary tractor once to get supplies over in town. Not that I saw much of the town—and not that Leda is much of a town, anyhow, to a person who has lived in Diego Borough—but I did see the hydroponics farms. There were three of them, big multiple sheds, named for what they grew in them, "Oahu," "Imperial Valley," and "Iowa." Nothing special about them, just the usual sort of soiless gardening. I didn't hang around because the flicker lighting they use to force the plants makes my eyes burn.

But I was interested in the tropical plants they grew in "Oahu"—I had never seen a lot of them before. I noticed that most of the plants were marked "M-G" while a few were tagged "N. T." I asked one of the gardeners; he said that "M-G" meant "mutation-Ganymede" and the other meant "normal terrestrial."

I found out later that almost everything grown on Ganymede was a special mutation adapted to Ganymede conditions.

Beyond there was another of the big multiple sheds named "Texas"; it had real cows in it and was very interesting. Did you know a cow moves its lower jaw from side to side? And no matter what you've heard, there is not one teat that is especially for cream.

I hated to leave, but "Texas" shed smelled too much like a space ship. It was only a short dash through the snow to the Exchange where all of Leda's retail buying and selling takes place—big and little shops all under one roof.

I looked around, thinking I might take a present back to Peggy, seeing that she was sick. I got the shock of my life. The prices!

If I had had to buy in the Exchange the measly fifty-eight pounds of stuff they had let me bring with me, it would have cost—I'm telling the truth!—several thousand credits. Everything that was imported from Earth cost that kind of money. A tube of beard cream was two hundred and eighty credits.

There were items for sale made on Ganymede, hand work mostly, and they were expensive, too, though not nearly as expensive as the stuff brought up from Earth.

I crept out of that place in a hurry. As nearly as I could figure the only thing cheap on Ganymede was food.

The driver of the commissary tractor wanted to know where I had been when there was loading to do? "I should have left you behind to walk back," he groused. I didn't have a good answer so I didn't say anything.

They shut off winter soon after that. The heat trap was turned on full force, the skies cleared and it was lovely. The first view I got of the Ganymede sky was a little after dawn next Sun phase. The heat trap made the sky a pale green but Jupiter shone right through it, ruddy orange, and big. Big and beautiful—I've never gotten tired of looking at Jupiter!

A harvest moon looks big, doesn't it? Well, Jupiter from Ganymede is sixteen or seventeen times as wide as the Moon looks and it covers better than two hundred and fifty times as much sky. It hangs there in the sky, never rising, never setting, and you wonder what holds it up.

I saw it first in half-moon phase and I didn't see how it could be any more beautiful than it was. But the Sun crept across the sky and a day later Jupiter was a crescent and better than ever. At the middle of Sun phase we went into eclipse, of course, and Jupiter was a great red, glowing ring in the sky, brightest where the Sun had just passed behind it.

But the best of all is during dark phase.

Maybe I ought to explain how the phases work; I know I didn't understand it until I came to Ganymede. Ganymede is such a small planet and so close to its primary that it is tide-locked, just the way the Moon is; it keeps one face always toward Jupiter and therefore Jupiter does not move in the sky. The sun moves, the other Jovian moons move, the stars move—but not good old Jove; it just hangs there.

Ganymede takes just over an Earth week to revolve around Jupiter, so we have three and a half days of sunlight and then three and a half days of darkness. By Ganymede time the period of rotation is exactly one week; twenty-four Ganymede hours is one seventh of the period. This arrangement makes a Ganymede minute about a standard second longer than an Earth minute, but who cares? Except scientists, of course, and they have clocks that keep both sorts of time.

So here is the way a week goes on Ganymede: the Sun rises at Sunday midnight every week; when you get up Monday morning it's a little above the eastern horizon and Jupiter is in half-moon phase. The

Sun keeps climbing higher and about suppertime on Tuesday it slides behind Jupiter and Ganymede is in eclipse; eclipse can last an hour or so up to a maximum of about three hours and a half. The stars come out and Jupiter shows that beautiful red ring effect because of its thick atmosphere. Then it's light again by bedtime Tuesday.

At noon on Thursday the Sun goes down and we start the dark phase; that's best of all. Jupiter's colors really show and the other moons are easier to see. They can be almost anywhere and in almost any combination.

Jupiter and its satellites is sort of a miniature solar system; from Ganymede you have a front seat for the show. There is always something new in the sky. Besides the eleven "historical" satellites ranging in size from Ganymede down to Jay-ten or Nicholson-Alpha, which is a ball of rock and ice only fifteen miles thick, there are maybe a dozen more a few miles or less in diameter but big enough to be called moons and heaven knows how many smaller than that. Sometimes these little ones come close enough to Ganymede to show discs; they mostly have very eccentric orbits. Any time there will be several that are conspicuous lights in the sky, like the planets are from Earth.

Io, and Europa, and Callisto are always discs. When Europa passes between Jupiter and Ganymede it is as big in the sky as the Moon is from Earth. It actually is as big as the Moon and at that time it is only about a quarter of a million miles away.

Then it swings around to the far side and is very much smaller— more than a million miles away and less than a quarter as wide. Io goes through the same sorts of changes, but it never gets as big.

When Io and Europa pass between Ganymede and Jupiter you can see them move with your naked eye, chasing their shadows or running ahead of them, depending on the phase. Io and Europa, being inside Ganymede's orbit, never get very far away from Jupiter, Io sticks within a couple of diameters of the big boy; Europa can get about sixty degrees away from it. Callisto is further out than Ganymede and goes all around the sky.

It's a show you never get tired of. Earth's sky is dull.

By six o'clock Saturday morning Jupiter would be in full phase and it was worthwhile to get up to see it. Not only was it the most gorgeous thing I had ever seen, but there was always the reverse eclipse, too, and you could see Ganymede's shadow, a little round black dot, crawling across old Jupiter's face. It gave you an idea of just how colossally big Jupiter was— there was the shadow of your whole planet on it and it wasn't anything more than a big freckle.

Jupiter is ninety thousand miles across the equator, eighty-four thousand from pole to pole. Ganymede is only a little better than three thousand.

For the next couple of days after full phase Jupiter would wane and at Sunday midnight it would be in half phase again, the Sun would rise and a new light phase would start. One thing I expected but didn't find was dim sunlight. Jupiter is a long way out; it gets only one twenty-seventh the sunlight that Earth does. I expected that we would always be in a sort of twilight.

It didn't work out that way. It seemed to me that the sunlight was just as bright as on Earth.

George says that this is an optical illusion and that it has to do with the way the human eye works, because the iris of the eye simply shuts out light it doesn't need. Bright desert sunlight back on Earth is maybe ten thousand foot-candles; the same thing on Ganymede is only four hundred foot-candles. But really good bright artificial light is only twenty-five foot candles and a "well-lighted" room is seldom that bright.

If you've got only a two-gallon bucket does it make any difference whether you fill it from the ocean or from a small pond? Sunlight on Ganymede was still more than the eye could accept, so it looked just as bright as sunlight on Earth.

I did notice, however, that it was almost impossible to get a sunburn.

11. "Share Croppers"

George got us a place to live when we had been there about a week, which was a lot better than most of the other immigrants did, but it didn't suit him and it didn't suit Molly and it didn't really suit me.

The trouble was he had to take a job as a staff engineer with the colonial government to get quarters for us—and that meant he would be too tied down to prove a piece of land for homestead. But it did carry private family quarters with it, if you could call two rooms twelve feet square a home.

It was like this: the colony was made up of homesteaders and townies. The townies worked for the government and lived in government-owned buildings —except for a very few who were in private trade. The townies included the Colonial Commission representative, Captain Hattie the pilot, the hydroponics engineers, the hospital staff, the engineers who ran the power plant and the heat trap, the staff of the local office of Project Jove, and everybody else who worked at anything but land farming. But most of the colonials were homesteaders and that's what George had meant us to be. Like most everybody, we had come out there on the promise of free land and a chance to raise our own food.

There was free land, all right, a whole planet of it. Putting up a house and proving a farm was another matter.

Here is the way it was supposed to work: A colonist comes out from Earth with his family and lands at Leda. The Colonial Commission gives him an apartment in town on arrival, helps him pick out a piece of land to improve and helps him get a house up on it. The Commission will feed him and his family for one Earth year—that is, two Ganymede years—while he gets a couple of acres under cultivation. Then he has ten G-years in which to pay back the Commission by processing at least twenty acres for the Commission—and he is allowed to process as much land for himself as for the Commission during the time he is paying what he owes. At the end of five Earth years he owns a tidy little farm, free and clear. After that, he can spread out and acquire more land, get into trade, anything he likes. He has his toehold and has paid off his debt.

The Colonial Commission had a big expensive investment in having started the atmosphere project and made the planet fit to live on in the first place. The land processed by the colonists was its return on the investment; the day would come when the Colonial Commission would own thousands of acres of prime farmland on Ganymede which it could then sell Earthside to later settlers ... if you wanted to emigrate from Earth you would have to pay for the privilege and pay high. People like us would not be able to afford it.

By that time, although Ganymede would be closed to free immigration, Callisto would have an atmosphere and pioneers could move in there and do it all over again. It was what the bankers call "Self-liquidating," with the original investment coming from Earth.

But here is the way it actually did work out: when we landed there were only about thirty thousand people on Ganymede and they were geared to accept about five hundred immigrants an Earth year, which was about all the old-type ships could bring out. Remember, those power-pile ships took over five years for the round trip; it took a fleet of them to bring in that many a year.

Then the Star Rover II was renamed the *Mayflower* and turned over to the Colonial Commission, whereupon six thousand people were dumped on them all at once. We were about as welcome as unexpected overnight guests when there is sickness in the family.

The colonists had known, for a full Earth year, that we were coming, but they had not been able to protest. While Earth Sender can punch a message through to Ganymede anytime except when the Sun is spang in the way, at that time the best radio the colony could boast had to relay via Mars to reach Earth—and then only when Mars was at its closest approach to Jupiter— which it wasn't.

I've got to admit that they did what they could for us. There was plenty to eat and they had managed to fix up places for us to sleep. The Immigrants' Receiving Station had formerly been split up into family apartments; they had torn out the partitions and used the partitions to build bunks for the big dormitories we were stacked in. They had moved their town hall and made it over into a mess hall and kitchen for us. We were in out of the weather and well fed, even if we were about as crowded as we had been in the *Mayflower*.

You may ask why, with a year to get ready, they had not built new buildings for us? Well, we asked the same thing, only we weren't asking, we were demanding, and we were sore about it!

They hadn't built new buildings because they could not. Before the Earthmen moved in, Ganymede was bare rock and ice. Sure, everybody knows that—but does everybody know what that means? I'm sure I didn't.

No lumber. No sheet metal. No insulation. No wires, No glass. No pipe. The settlers in North America built log cabins—no logs.

The big hydroponics sheds, the Receiving Station and a few other public buildings had been built with materials lifted a half a billion miles from Earth. The rest of Leda and every homesteader's farm house had been built the hard way, from country rock. They had done their best for us, with what they had.

Only we didn't appreciate it.

Of course we should not have complained. After all, as George pointed out, the first California settlers starved, nobody knows what happened to the Roanoke Colony, and the first two expeditions to Venus died to the last man. We were safe.

Anyhow, even if we had to put up with barracks for a while, there was all that free land, waiting for us.

On close inspection, it looked as if it would have to wait quite a while. That was why George had given in and taken a staff engineering job. The closest land to town open to homesteading was nine miles away. To find enough land for six thousand people meant that most of them would have to go about eighteen to twenty miles away.

"What's twenty miles? A few minutes by tube, an up-and-down hop for a copter—brother, have you ever walked twenty miles? And then walked back again?

It wasn't impossible to settle six thousand people that far from town; it was just difficult—and slow. The pioneer explorer used to set out with his gun and an axe; the settler followed by hitching his oxen to a wagonload of furniture and farm tools. Twenty miles meant nothing to them.

They weren't on Ganymede.

The colony had two tractor trucks; another had come in the *Mayflower*. That's all the transportation there was on the whole planet —not just to settle six thousand people but for the daily needs of thirty thousand people who were there ahead of us.

They explained it all to us at a big meeting of heads of families. I wasn't supposed to be there but it was held outdoors and there was nothing to stop me. The chief ecologist and the chief engineer of the planet were there and the chairman of the colony council presided. Here was the proposition:

What Ganymede really needed was not more farmers, but manufacturing. They needed prospectors and mines and mills and machine shops. They needed all the things you can make out of metal and which they simply could not afford to import from Earth. That's what they wanted us to work on and they would feed any of us who accepted, not just for a year, but indefinitely.

As for any who insisted on homesteading—well, the land was there; help ourselves. There wasn't enough processing machinery to go around, so it might be two or three years before any particular immigrant got a chance to process his first acre of ground.

Somebody stood up near the front of the crowd and yelled, "We've been swindled!"

It took Mr. Tolley, the chairman, quite a while to calm them down. When they let him talk again, he said, "Maybe you have been swindled, maybe you haven't. That's a matter of opinion. I'm quite willing to concede that conditions here are not the way they were represented to you when you left Earth. In fact—"

Somebody yelled. "That's mighty nice of you!" only the tone was sarcastic.

Mr. Tolley looked vexed. "You folks can either keep order, or I'll adjourn this meeting."

They shut up again and he went on. Most of the present homesteaders had processed more land than they could cultivate. They could use hired hands to raise more crops. There was a job waiting for every man, a job that would keep him busy and teach him Ganymede farming—and feed his wife and family-while he was waiting his turn to homestead.

You could feel a chill rolling over the crowd when the meaning of Mr. Tolley's words sunk in. They felt the way Jacob did when he had labored seven years and then was told he would have to labor another seven years to get the girl he really wanted. I felt it myself, even though George had already decided on the staff job.

A man spoke up. "Mr. Chairman!"

"Yes? Your name, please."

"Name of Saunders. I don't know how the rest of them feel, but I'm a farmer. Always have been. But I said 'farmer,' not sharecropper. I didn't come here to hire out to no boss. You can take your job and do what you see fit with it. I stand on my rights!"

There was scattered applause and the crowd began to perk up. Mr. Tolley looked at him and said, "That's your privilege, Mr. Saunders."

"Huh? Well, I'm glad you feel that way, Mr. Chairman. Now let's cut out the nonsense. I want to know two things: what piece of land am I going to get and when do I lay hands on some machinery to start putting it into condition?"

Mr. Tolley said, "You can consult the land office about your first question. As to the second, you heard the chief engineer say that he estimates the average wait for processing machinery will be around twenty-one months."

"That's too long."

"So it is, Mr. Saunders."

"Well, what do you propose to do about it?" Mr. Tolley shrugged and spread his hands. "I'm not a magician. We've asked the Colonial Commission by urgent message going back on the *Mayflower* not to send us any more colonists on the next trip, but to send us machinery. If they agree, there may be some relief from the situation by next winter. But you have seen—all of you have already seen—that the Colonial Commission makes decisions without consulting us. The first trip of the *Mayflower* should have been all cargo; you folks should have waited."

Saunders thought about it. "Next winter, eh? That's five months away. I guess I can wait—I'm a reasonable man. But no sharecropping; that's outl"

"I didn't say you could start homesteading in five months, Mr. Saunders. It may be twenty-one months or longer."

"No, indeedy!"

"Suit yourself. But you are confronted with a fact, not a theory. If you do have to wait and you won't work for another farmer, how do you propose to feed yourself and your family in the mean time?"

Mr. Saunders looked around and grinned, "Why, in that case, Mr. Chairman, I guess the government will just have to feed us until the government can come through on its end of the deal. I know my rights."

Mr. Tolley looked at him as if he had just bitten into an apple and found Saunders inside. "We won't let your children starve," he said slowly, "but as for you, you can go chew rocks. If you won't work, you won't eat."

Saunders tried to bluster. "You can't get away with it! I'll sue the government and I'll sue you as the responsible government official You can't—"

"Shut up!" Mr. Tolley went on more quietly, speaking to all of us. "We might as well get this point straight. You people have been enticed into coming out here by rosy promises and you are understandably disappointed. But your contract is with the Colonial Commission back on Earth. But you have no contract with the common council of Ganymede, of which I am chairman, and the citizens of Ganymede owe you nothing. We are trying to take care of you out of common decency.

"If you don't like what we offer you, don't start throwing your weight around with me; I won't stand for it. Take it up with the representative of the Immigration Service. That's what he is here for. Meeting's adjourned!"

But the immigration representative wasn't there; he had stayed away from the meeting.

12. Bees and Zeroes

We had been swindled all right. It was equally clear that there was no help for it. Some of the immigrants did see the Colonial Commission representative, but they got no comfort out of him. He had resigned, he said, fed up with trying to carry out impossible instructions five hundred million miles from the home office. He was going home as soon as his relief arrived.

That set them off again; if he could go home so could they. The *Mayflower* was still in orbit over us, taking on cargo. A lot of people demanded to go back in her.

Captain Harkness said no, he had no authority to let them deadhead half way across the system. So they landed back on the Commission representative, squawking louder than ever.

Mr. Tolley and the council finally settled it. Ganymede wanted no soreheads, no weak sisters. If the Commission refused to ship back those who claimed they were gypped and didn't want to stay, then the next shipload wouldn't even be allowed to land. The representative gave in and wrote Captain Harkness out a warrant for their passage.

We held a family powwow over the matter, in Peggy's room in the hospital—it had to be there because the doctors were keeping her in a room pressurized to Earth normal

Did we stay, or did we go back? Dad was stuck in a rut. Back Earthside he at least had been working for himself; here he was just an employee. If he quit bis job and elected to homestead, it meant working two or three G-years as a field hand before we could expect to start homesteading.

But the real rub was Peggy. In spite of having passed her physical examination Earthside she hadn't adjusted to Ganymede's low pressure. "We might as well face it," George said to Molly. "We've got to get Peg back to the conditions she's used to."

Molly looked at him; his face was as long as my arm. "George, you don't want to go back, do you?"

"That's not the point, Molly. The welfare of the kids comes first." He turned to me and added, "You're not bound by this, Bill. You are big enough to make up your own mind. If you want to stay, I am sure it can be arranged."

I didn't answer right away. I had come into the family get-together pretty disgusted myself, not only because of the run-around we had gotten, but also because of a run-in I had had with a couple of the Colonial kids. But you know what it was that swung me around? That pressurized room. I had gotten used to low pressure and I liked it. Peggy's room, pressurized to Earth normal, felt like swimming in warm soup. I could hardly breath. "I don't think I want to go back," I said.

Peggy had been sitting up in bed, following the talk with big eyes, like a little lemur. Now she said, "I don't want to go back, eitherl"

Molly patted her hand and did not answer her, "George," she said, "I've given this a lot of thought You don't want to go back, I know. Neither does Bill But we don't all have to go back. We can—"

"That's out, Molly," Dad answered firmly. "I didn't marry you to split up. If you have to go back, I go back."

"I didn't mean that. Peggy can go back with the O'Farrells and my sister will meet her and take care of her at the other end. She wanted me to leave Peggy with her when she found I was determined to go. It will work out all right." She didn't look at Peggy as she said it.

"But, Molly!" Dad said.

"No George," she answered, "I've thought this all out. My first duty is to you. It's not as if Peggy wouldn't be well taken care of; Phoebe will be a mother to her and—"

By now Peggy had caught her breath. "I don't want to go live with Aunt Phoebe!" she yelled and started to bawl.

George said, "It won't work, Molly."

Molly said, "George, not five minutes ago you were talking about leaving Bill behind, on his own."

"But Bill is practically a man!"

"He's not too old to be lonesome. And I'm not talking about leaving Peggy alone; Phoebe will give her loving care. No, George, if the womenfolk ran home at the first sign of trouble there never would be any pioneers. Peggy has to go back, but I stay."

Peggy stopped her blubbering long enough to say, "I won't go back! I'm a pioneer, too—ain't I, Bill?"

I said, "Sure kid, sure!" and went over and patted her hand. She grabbed onto mine.

I don't know what made me say what I did then. Goodness knows the brat had never been anything but a headache, with her endless questions and her insistence that she be allowed to do anything I did. But I heard myself saying, "Don't worry, Peggy. If you go. back, I'll go with you."

Dad looked at me sharply, then turned to Peggy. "Bill spoke hastily, Baby. You mustn't hold him to that."

Peggy said, "You did so mean it, didn't you, Bill?"

I was regretting it already. But I said, "Sure, Peggy."

Peggy turned back to Dad. "See? But it doesn't matter; we're not going back, not any of us. Please Daddy —I'll get well, I promise you I will. I'm getting better every day."

Sure, she was—in a pressurized room. I sat there, sweating, and wishing I had kept my big mouth shut. Molly said, "It defeats me, George. What do you think?"

"Mmmm—"

"Well?"

"Uh, I was thinking we could pressurize one room in our quarters. I could rig some sort of an impeller in the machine shop."

Peggy was suddenly all over her tears. "You mean I can get out of the hospital?"

"That's the idea, Sugar, if Daddy can work it."

Molly looked dubious. "That's no answer to our problems, George."

"Maybe not." Dad stood up and squared his shoulders. "But I have decided one thing; we all go, or we'll all stay. The Lermers stand together. That's settled."

Homesteading wasn't the only thing we had been mistaken about. There was Scouting on Ganymede even if the news hadn't gotten back to Earth. There hadn't been any meetings of the *Mayflower* troops after we landed; everybody had been just too busy to think about it. Organized Scouting is fun, but sometimes there just isn't time for it.

There hadn't been any meetings of the Leda Troop, either. They used to meet in their town hall; now we had their town hall as a mess hall, leaving them out in the cold. I guess that didn't tend to make them fee! chummy towards us.

I ran into this boy over in the Exchange. Just as he was passing me I noticed a little embroidered patch on his chest. It was a homemade job and not very good, but I spotted it. "Hey!" I said.

He stopped. " 'Hey' yourself! Were you yelling at me?"

"Uh, yes. You're a Scout, aren't you?"

"Certainly."

"So am I. My name's Bill Lermer. Shake." I slipped him the Scout grip.

He returned it. "Mine's Sergei Roskov." He looked me over. "You're one of the Johnny-Come-Latelies, aren't you?"

"I came over in the *Mayflower*" I admitted.

"That's what I meant. No offense— I was born Earthside, myself. So you used to be a Scout, back home. That's good. Come around to meeting and we'll sign you up again."

"I'm still a Scout," I objected.

"Huh? Oh, I get you—'Once a Scout, always a Scout.' Well, come around and we'll make it official."

That was a very good time for me to keep my lip zipped. But not me—oh, no! When comes the Tromp of Doom, I'll still be talking instead of listening. I said, "It's as official as it can be. I'm senior patrol leader, Baden-Powell Troop."

"Huh? You're kind of far away from your troop, aren't you?"

So I told him all about it. He listened until I was through, then said quietly, "And you laddie bucks had the nerve to call yourselves the 'Boy Scouts of Ganymede.' Anything else you would like to grab? You already have our meeting hall; maybe you'd like to sleep in our beds?"

"What do you mean?"

"Nothing." He seemed to be thinking it over. "Just a friendly warning, Bill——"

"Huh?"

"There is only one senior patrol leader around here–and you're looking right at him. Don't make any mistake about it. But come on around to meeting anyhow," he added. "You'll be welcome. We're always glad to sign up a new tenderfoot."

I went back to the Receiving Station and looked up Hank Jones and told him all about it. He looked at me admiringly. "William, old son," he said, "I've got to hand it to you. It takes real talent to louse things up that thoroughly. It's not easy."

"You think I've messed things up?"

"I hope not. Well, let's look up Doc Archibald and see what can be done."

Our troop master was holding clinic; we waited until the patients were out of the way, then went in. He said, "Are you two sick, or just looking for a ticket to gold brick?"

"Doc," I said, "we were wrong. There are so Scouts on Ganymede."

"So I know," he answered.

I said, "Huh?"

"Mr. Ginsberg and Mr. Bruhn and I have been negotiating with the senior Scout officials here to determine just how our troops will be taken into the parent organization. It's a bit complicated as there are actually more *Mayflower* Scouts than there are in the local troop. But they have jurisdiction, of course."

I said, "Oh."

"Well have a joint meeting in a few days, after we get the rules ironed out."

I thought it over and decided I had better tell him what had happened, so I did.

He listened, not saying anything. Finally I said, "Hank seems to think I've messed things up. What do you think, Doc?"

"Mmmm—" he said. "Well, I hope he's wrong. But I think I may say you haven't helped the situation any."

I didn't know what to say. "Don't look so tragic about it," he urged. "You'll get well. Now run along and forget it. It may not make any difference."

But it did make a difference. Doc and the others had been pitching for our troops to be recognized as properly constituted troops, with all ratings acknowledged. But after Sergei spread the word around, the regular Ganymede Scouts all squawked that we were nothing but a bunch of tenderfeet, no matter what we had been back on Earth. The place for us to start was the bottom; if we were any good, we could prove it— by tests.

It was compromised; George says things like that are always compromised. Ratings were confirmed on probation, with one G-year to make up any tests that were different. Our troops were kept intact But there was one major change:

All patrol leaders had to be from the original Ganymede Scouts; they were transferred from the Leda troop. I had to admit the justice of it. How could I be a patrol leader on Ganymede when I was still so green that I didn't know northwest from next week? But it didn't set well with the other fellows who had been patrol leaders when the word got around that I was responsible for the flies in the soup.

Hank talked it over with me. "Billy my boy," he told me, "I suppose you realize that you are about as popular as ants at a picnic?"

"Who cares?" I objected.

"You care. Now is the time for all good men to perform an auto da fé"

"What in great blazing moons is an auto da fé?"

"In this case it means for you to transfer to the Leda Troop."

"Have you gone crazy? You know what those guys think of us, especially me. I'd be lucky to get away with my life."

"Which just goes to show how little you know about human nature. Sure, it would be a little rough for a while, but it's the quickest way to gain back some respect."

"Hank, you really are nuts. In that troop I really would be a tenderfoot—and how!"

"That's just the point," Hank went on quietly, "We're all tenderfeet—only here in our own troop it doesn't show. If we stay here, we'll keep on being tenderfeet for a long time. But if we transfer, we'll be with a bunch who really know their way around—and some of it will rub off on us."

"Did you say 'we'?"

"I said 'we'."

"I catch on. You want to transfer, so you worked tip this gag about how I ought to do so, so you would have company. A fine chum you are!"

He just grinned, completely unembarrassed. "Good old Bill! Hit him in the head eight or nine times and he can latch on to any idea. It won't be so bad, Bill. In precisely four months and nine days we won't be tenderfeet; we'll be old timers."

"Why the exact date?"

"Because that is the due date of the *Mayflower* on her next trip—as soon as they arrive they'll be the Johnny-Come-Latelies."

"Oh!"

Anyhow, we did it—and it was rough at first, especially on me… like the night they insisted that I tell them how to be a hero. Some twerp had gotten hold of the meteorite story. But the hazing wasn't too bad and Sergei put a stop to it whenever he caught them at it. After a while they got tired of it.

Sergei was so confounded noble about the whole thing that I wanted to kick him.

The only two merit badges to amount to anything that stood in the way of my getting off probation and back up to my old rating of Eagle Scout were agronomy and planetary ecology, Ganymede style. They were both tough subjects but well worth studying. On Ganymede you had to know them to stay alive, so I dug in.

Ecology is the most involved subject I ever tackled. I told George so and he said possibly politics was worse—and on second thought maybe politics was just one aspect of ecology. The dictionary says ecology is "the science of the interrelations of living organisms and their environment." That doesn't get you much, does it? It's like defining a hurricane as a movement of air.

The trouble with ecology is that you never know where to start because everything affects everything else. An unseasonal freeze in Texas can affect the price of breakfast in Alaska and that can affect the salmon catch and that can affect something else. Or take the old history book case: the English colonies took England's young bachelors and that meant old maids at home and old maids keep cats and the cats catch field mice and the field mice destroy the bumble bee nests and bumble bees are necessary to clover and cattle eat clover and cattle furnish the roast beef of old England to feed the soldiers to protect the colonies that the bachelors emigrated to, which caused the old maids.

Not very scientific, is it? I mean you have too many variables and you can't put figures to them. George says that if you can't take a measurement and write it down in figures you don't know enough about a thing to call what you are doing with it "science" and, as for him, hell stick to straight engineering, thank you.

But there were some clear cut things about applied ecology on Ganymede which you could get your teeth into. Insects, for instance—on Ganymede, under no circumstances do you step on an insect. There were no insects on Ganymede when men first landed there. Any insects there now are there because the bionomics board planned it that way and the chief ecologist okayed the invasion. He wants that insect to stay right where it is, doing whatever it is that insects do; he wants it to wax and grow fat and raise lots of little insects.

Of course a Scout doesn't go out of his way to step on anything but black widow spiders and the like, anyhow—but it really brings it up to the top of your mind to know that stepping on an insect carries with it a stiff fine if you are caught, as well as a very pointed lecture telling you that the colony can get along very nicely without you but the insects are necessary.

Or take earthworms. I know they are worth their weight in uranium because I was buying them before I was through. A farmer can't get along without earthworms.

Introducing insects to a planet isn't as easy as it sounds. Noah had less trouble with his animals, two by two, because when the waters went away he still had a planet that was suited to his load. Ganymede isn't Earth. Take bees—we brought bees in the *Mayflower* but we didn't turn them loose; they were all in the shed called "Oahu" and likely to stay there for a smart spell. Bees need clover, or a reasonable facsimile. Clover would grow on Ganymede but our real use for clover was to fix nitrogen in the soil and thereby refresh a worn out field. We weren't planting clover yet because there wasn't any nitrogen in the air to fix—or not much.

But I am ahead of my story. This takes us into the engineering side of ecology. Ganymede was bare rock and ice before we came along, cold as could be, and no atmosphere to speak of—just traces of ammonia and methane. So the first thing to do was to give it an atmosphere men could breathe.

The material was there—ice. Apply enough power, bust up the water molecule into hydrogen and oxygen. The hydrogen goes up—naturally—and the oxygen sits on the surface where you can breathe it. That went on for more than fifty years.

Any idea how much power it takes to give a planet the size of Ganymede three pressure-pounds of oxygen all over its surface?

Three pressure-pounds per square inch means nine mass pounds, because Ganymede has only one third the surface gravitation of Earth. That means you have to start with nine pounds of ice for every square inch of Ganymede—and that ice is cold to start with, better than two hundred degrees below zero Fahrenheit

First you warm it to die freezing point, then you melt it, then you dissociate the water molecule into oxygen and hydrogen—not in the ordinary laboratory way by electrolysis, but by extreme heat in a mass converter. The result is three pressure pounds of oxygen and hydrogen mix for that square inch. It's not an explosive mixture, because the hydrogen, being light, sits on top and the boundary layer is too near to being a vacuum to maintain burning.

But to carry out this breakdown takes power and plenty of it—65,000 Btus for each square inch of surface, or for each nine pounds of ice, whichever way you like it. That adds up; Ganymede may be a small planet but it has 135,000,000,000,000,000 square inches of surface. Multiply that by 65,000 Btus for each square inch, then convert British thermal units to ergs and you get:

92,500,000,000,000,000,000,000,000,000,000 ergs.

Ninety-two-and-a-half million billon quadrillion ergs! That figure is such a beauty that I wrote it down in my diary and showed it to George.

He wasn't impressed. George said that all figures were the same size and nobody but a dimwit is impressed by strings of zeroes. He made me work out what the figure meant in terms of mass-energy, by the good old $E = MC^2$ formula, since mass-energy converters were used to give Ganymede its atmosphere.

By Einstein's law, one gram mass equals $9x10^{20}$ ergs, so that fancy long figure works out to be $1.03x10^{11}$ grams of energy, or 113,200 tons. It was ice, mostly, that they converted into energy, some of the same ice that was being turned into atmosphere—though probably some country rock crept in along with the ice. A mass converter will eat anything.

Let's say it was all ice; that amounts to a cube of ice a hundred and sixty feet on an edge. That was a number I felt I could understand.

I showed my answer to George and he still was not impressed. He said I ought to be able to understand one figure just as easily as the other, that both meant the same thing, and both figures were the same size.

Don't get the idea that Ganymede's atmosphere was made from a cube of ice 160 feet on a side; that was just the mass which had to be converted to energy to turn the trick. The mass of ice which was changed to oxygen and hydrogen would, if converted back into ice, cover the entire planet more than twenty feet deep —like the ice cap that used to cover Greenland.

George says all that proves is that there was a lot of ice on Ganymede to start with and that if we hadn't had mass converters we could never have colonized it. Sometimes I think engineers get so matter of fact that they miss a lot of the juice in life.

With three pressure-pounds of oxygen on Ganymede and the heat trap in place and the place warmed up so that blood wouldn't freeze in your veins colonists could move in and move around without wearing space suits and without living in pressure chambers. The atmosphere project didn't stop, however. In the first place, since Ganymede has a low escape speed, only 1.8 miles per second compared with Earth's 7 m/s, the new atmosphere would gradually bleed off to outer space, especially the hydrogen, and would be lost— in a million years or so. In the second place, nitrogen was needed.

We don't need nitrogen to breathe and ordinarily we don't think much about it. But it takes nitrogen to make protein—muscle. Most plants take it out of the ground; some plants, like clover and alfalfa and beans, take it out of the air as well and put it back into the ground. Ganymede's soil was rich in nitrogen; the original scanty atmosphere was partly ammonia—but the day would come when we would have to put the nitrogen back in that we were taking out. So the atmosphere project was now turned to making nitrogen.

This wasn't as simple as breaking up water; it called for converting stable isotope oxygen-16 into stable isotope nitrogen-14, an energy consuming reaction probably impossible in nature—or so the book said—and long considered theoretically impossible. I hadn't had any nucleonics beyond high school physics, so I skipped the equations. The real point was, it could be done, in the proper sort of a mass-energy converter, and Ganymede would have nitrogen in her atmosphere by the time her fields were exhausted and had to be replenished.

Carbon dioxide was no problem; there was dry ice as well as water ice on Ganymede and it had evaporated into the atmosphere long before the first homesteader staked out a claim.

Not that you can start farming with oxygen, carbon dioxide, and a stretch of land. That land was dead. Dead as Christopher Columbus. Bare rock, sterile, no life of any sort—and there never had been any life in it. It's a far piece from dead rock to rich, warm, black soil crawling with bacteria and earthworms, the sort of soil you have to have to make a crop.

It was the job of the homesteaders to make the soil.

See how involved it gets? Clover, bees, nitrogen, escape speed, power, plant-animal balance, gas laws, compound interest laws, meteorology—a mathematical ecologist has to think of everything and think of it ahead of time. Ecology is explosive; what seems like a minor and harmless invasion can change the whole balance. Everybody has heard of the English sparrow. There was the Australian jack rabbit, too, that darn near ate a continent out of house and home. And the Caribbean mongoose that killed the chickens it was supposed to protect. And the African snail that almost ruined the Pacific west coast before they found a parasite to kill it.

You take a harmless, useful insect, plant, or animal to Ganymede and neglect to bring along its natural enemies and after a couple of seasons you'll wish you had imported bubonic plague instead.

But that was the chief ecologist's worry; a farmer's job was engineering agronomy—making the soil and then growing things in it.

That meant taking whatever you came to—granite boulders melted out of the ice, frozen lava flows, pumice, sand, ancient hardrock—and busting it up into little pieces, grinding the top layers to sand, pulverizing the top few inches to flour, and finally infecting the topmost part with a bit of Mother Earth herself–then nursing what you had to keep it alive and make it spread. It wasn't easy.

But it was interesting. I forgot all about my original notion of boning up on the subject just to pass a merit badge test. I asked around and found out where I could see the various stages going on and went out and had a look for myself. I spent most of one light phase just looking.

When I got back to town I found that George had been looking for me. "Where in blazes have you been?" he wanted to know.

"Oh, just out and around," I told him, "seeing how the 'steaders do things."

He wanted to know where I had slept and how I had managed to eat? "Bill, it's all very well to study for your merit badges but that's no reason to turn into a tramp," he objected. "I guess I have neglected you lately—I'm sorry." He stopped and thought for a moment, then went on, "I think you had better enter school here. It's true they haven't much for you, but it would be better than running around at loose ends."

"George?"

"Yes, that's probably the best-huh?"

"Have you completely given up the idea of homesteading?"

Dad looked worried. "That's a hard question, Bill. I still want us to, but with Peggy sick—it's difficult to say. But our name is still in the hat. I'll have to make up my mind before the drawing."

"Dad, I'll prove it."

"Eh?"

"You keep your job and take care of Peggy and Molly. I'll make us a farm."

13. Johnny Appleseed

The drawing of our division took place three weeks later; the next day George and I walked out to see what we had gotten. It was west of town out through Kneiper's Ridge, new country to me; I had done my exploring east of town, over toward the power plant, where most of the proved land was located.

We passed a number of farms and some of them looked good, several acres in cultivation, green and lush, and many more acres already chewed level. It put me in mind of Illinois, but there was something missing. I finally figured out what it was—no trees.

Even without trees it was beautiful country. On the right, north of us, were the foothills of the Big Rock Candy Mountains. Snow-covered peaks thrust up beyond them, twenty or thirty miles away. On the left, curving in from the south and closer than it came to Leda, was Laguna Serenidad. We were a couple of hundred feet higher than the lake. It was a clear day and I tried to see the far shore, but I couldn't be sure.

It was a mighty cheerful scene. Dad felt it, too. He strode along, whistling "Beulah Land" off key. I get my musical talent from Anne.

He broke off and said, "Bill, I envy you."

I said, "We'll all be together yet, George. I'm the advance guard." I thought a bit and said, "George, do you know what the first thing I raise is going to be–after I get some food crops in?"

"What?"

"I'm going to import some seed and raise you some tobacco."

"Oh, no, Son!"

"Why not?" I knew he was touched by it, because he called me 'Son'. "I could do it, as well as not."

"It's a kind thought, but we'll have to stick to the main chance. By the time we can afford that, I will have forgotten how to light a pipe. Honest, I don't miss it."

We slogged along a bit further, not saying anything but feeling close together and good. Presently the road played out. Dad stopped and took his sketch map out of his pouch. "This must be about it."

The sketch showed where the road stopped, with just a dotted line to show where it would be, some day. Our farm was outlined on it, with the nearest comer about half a mile further along where the road ought to be and wasn't. By the map, the edge of our property—or what would be ours if we proved it—ran along the north side of the road about a quarter of a mile and from there back toward the foothills. It was marked "Plot 117-H-2" and had the chief engineer's stamp on it.

Dad was staring at where the road ended. There was a lava flow right across it, high as my head and rough as a hard winter in Maine. "Bill," he said, "How good an Indian are you?"

"Fair, I guess."

"We'll have to try to pace it off and hold a straight line due west."

But it was almost impossible to do it. We struggled and slipped on the lava and made detours. Lava looks soft and it isn't. Dad slipped and skinned his shin and I discovered that I had lost track of how many paces we had come. But presently we were across the flow and in a boulder field. It was loose rubble, from pieces the size of a house down to stuff no bigger than your fist—stuff dropped by the ice when it melted and formed Laguna Serenidad.

George says that Ganymede must have had a boisterous youth, covered with steam and volcanoes.

The boulder field was somewhat easier going but it was even harder to hold a straight line. After a bit Dad stopped. "Bill," he said, "do you know where we are?"

"No," I admitted, "but we aren't really lost. If we head back east we are bound to come to proved ground."

"Perhaps we had better."

"Wait a minute." There was a particularly big boulder ahead of us. I picked a way and managed to scramble to the top with nothing worse than a cut on my hand. I stood up. "I can see the road," I told Dad. "We're north of where we ought to be. And I think maybe we've come too far." I marked a spot with my eye and came down.

We worked south the amount I thought was right and then headed east again. After a bit I said, "I guess we missed it, George. I'm not much of an InHe said, "So? What's this?" He was a little ahead of me and had stopped.

It was a cairn with a flat rock on top. Painted on it was: "117-H-2, SE corner."

We had been on our farm for the past half hour; the big boulder I had climbed up on was on it.

We sat down on a fairly flat rock and looked around. Neither of us said anything for a while; we were both thinking the same thing: if this was a farm, I was my own great uncle.

After a bit Dad muttered something. I said, "What did you say?"

"Golgotha," he said out loud. "Golgotha, the place of skulls." He was staring straight ahead.

I looked where he was looking; there was a boulder sitting on top of another and the way the sun caught it, it did look like a skull. It leered at us.

It was so darn quiet you could hear your hair grow. The place was depressing me. I would have given anything to hear something or see something move. Anything—just a lizard darting out from behind a rock, and I could have kissed it.

But there were no lizards here and never had been.

Presently Dad said, "Bill, are you sure you want to tackle this?"

"Sure I'm sure."

"You don't have to, you know. If you want to go back to Earth and go to M.I.T., I could arrange it for the next trip."

Maybe he was thinking that if I went back, I could take Peggy with, me and she would be willing to go. Maybe I should have said something about it. But didn't; I said, "Are you going back?"

"No."

"Neither am I." At the moment is was mostly stubbornness. I had to admit that our "farm" wasn't flowing with milk and honey; in fact it looked grim. Nobody but a crazy hermit would want to settle down in such a spot.

"Think it over, Bill."

"I've thought it over."

We sat there a while longer, not saying anything, just thinking long thoughts. Suddenly we were almost startled out of our boots by somebody yodelling at us. A moment before I had been wishing to hear just anything, but when it came it was like unexpectedly encountering a clammy hand in the dark.

We both jumped and Dad said, "What in the—?" I looked around. There was a large man coming toward us. In spite of his size he skipped through the rocks like a mountain goat, almost floating in the low gravity. As he got closer I knew I had seen him before; he was on the Court of Honor, a Mr. Schultz.

Dad waved to him and pretty soon he reached us. He stood half a head taller than Dad and would have made the pair of us, he was so big. His chest was as thick as my shoulders were broad and his belly was thicker than that. He had bushy, curly red hair and his beard spread out over his chest like a tangle of copper springs. "Greetings, citizens," he boomed at us, "my name is Johann Schultz."

Dad introduced us and he shook hands and I almost lost mine in his. He fixed his eyes on me and said, "I've seen you before, Bill."

I said I guessed he had, at Scout meetings. He nodded and added, "A patrol leader, no?"

I admitted that I used to be. He said, "And soon again," as if the matter were all settled. He turned to Dad. "One of the kinder saw you going past on the road, so Mama sent me to find you and bring you back to the house for tea and some of her good coffee cake."

Dad said that was very kind but that we didn't want to impose. Mr. Schultz didn't seem to hear him. Dad explained what we were there for and showed him the map and pointed out the cairn. Mr. Schultz nodded four or five times and said, "So we are to be neighbors. Good, good!" He added to Dad "My neighbors call me John, or sometimes 'Johnny'." Dad said his name was George and from then on they were old friends.

Mr. Schultz stood by the cairn and sighted off to the west and then north to the mountains. Then he scrambled up on a big boulder where he could see better and looked again. We went up after him.

He pointed to a rise west of us. "You put your house so, not too far from the road, but not on it. And first you work this piece in here and next season you work back further toward the hills." He looked at me and added. "No?"

I said I guessed so. He said, "It is good land, Bill. You will make a fine farm." He reached down and picked up a piece of rock and rubbed it between his fingers. "Good land," he repeated.

He laid it down carefully, straightened up, and said, "Mama will be waiting for us."

Mama was waiting for us, all right, and her idea of a piece of coffee cake was roughly what they used to welcome back the Prodigal Son. But before we got into the house we had to stop and admire the Tree.

It was a real tree, an apple tree, growing in a fine bluegrass lawn out in front of his house. Furthermore it was bearing fruit on two of its limbs. I stopped and stared at it.

"A beauty, eh, Bill?" Mr. Schultz said, and I agreed. "Yes," he went on, "it's the most beautiful tree on Ganymede—you know why? Because it's the only tree on Ganymede." He laughed uproariously and dug me in the ribs as if he had said something funny. My ribs were sore for a week.

He explained to Dad all the things he had had to do to persuade it to grow and how deep down he had had to go to prepare for it and how he had had to channel out to drain it. Dad asked why it was bearing only on one side. "Next year we pollenate the other side," he answered, "and then we have Stark's Delicious. And Rome Beauties. This year, Rhode Island Greenings and Winesaps." He reached up and picked one. "A Winesap for you, Bill."

I said thanks and bit into it. I don't know when I've tasted anything so good.

We went inside and met Mama Schultz and four or five other Schultzes of assorted sizes, from a baby crawling around in the sand on the floor up to a girl as old as I was and nearly as big. Her name was Gretchen and her hair was red like her father's, only it was straight and she wore it in long braids. The boys were mostly blond, including the ones I met later.

The house was mainly a big living room, with a big table down the middle of it. It was a solid slab of rock, maybe four feet wide and twelve or thirteen feet long, supported by three rock pillars. A good thing it was rock, the way Mama Schultz loaded it down.

There were rock slab benches down the long sides and two real chairs, one at each end, made out of oil drums and padded with stuffed leather cushions.

Mama Schultz wiped her face and hands on her apron and shook hands and insisted that Dad sit down in her chair; she wouldn't be sitting down much, she explained. Then she turned back to her cooking while Gretchen poured tea for us.

The end of the room was the kitchen and was centered around a big stone fireplace. It had all the earmarks of being a practical fireplace—and it was, as I found out later, though of course nothing had ever been burned in it. It was really just a ventilation hole. But Papa Schultz had wanted a fireplace so he had a fireplace. Mama Schultz's oven was set in the side of it.

It was faced with what appeared to be Dutch tile, though I couldn't believe it. I mean, who is going to import anything as useless as Ornamental tile all the way from Earth? Papa Schultz saw me looking at them and said, "My little girl Kathy paints good, huh?" One of the medium-sized girls blushed and giggled and left the room.

I had the apple down to a very skinny core and was wondering what to do with it in that spotless room when Papa Schultz stuck out his hand. "Give it to me, Bill."

I did. He took out his knife and very gently separated out the seeds. One of the kids left the room and fetched him a tiny paper envelope in which he placed the seeds and then sealed it. He handed it to me. "There, Bill," he said. "I have only one apple tree, but you have eight!"

I was sort of surprised, but I thanked him. He went on, "That place just this side of where you will build your house—if you will fill that gully from the bottom, layer by layer, building your soil as you go, with only a very little 'pay dirt' you will have a place that will support a whole row of trees. When your seedlings are big, we’ll bud from my tree."

I put them very carefully in my pouch.

Some of the boys drifted in and washed up and soon we were all sitting around the table and digging into fried chicken and mashed potatoes and tomato preserves and things. Mama Schultz sat beside me and kept pressing food on me and insisting that I wasn't eating enough to keep body and soul together which wasn't true.

Afterwards I got acquainted with the kids while George and Papa Schultz talked. Four of the boys I knew; they were Scouts. The fifth boy, Johann Junior —they called him "Yo"—was older than I, almost twenty, and worked in town for the chief engineer. The others were Hugo and Peter, both Cubs, then Sam, and then Vic, who was an Explorer Scout, same as I was. The girls were the baby, Kathy and Anna, who seemed to be twins but weren't, and Gretchen. They all talked at once.

Presently Dad called me over. "Bill, you know we don't rate a chance at a rock crusher for several months."

"Yes," I said, somewhat mystified.

"What are your plans in the meantime?"

"Uh, well, I don't know exactly. Study up on what I'll have to do."

"Mmrn… Mr. Schultz has very kindly offered to take you on as a farm hand in the meantime. What do you think of the idea?"

14. Land of My Own

Papa Schultz needed a field hand about as much as I need four ears, but that didn't keep me from moving in. In that family everybody worked but the baby and you could count on it that she would be washing dishes as soon as she was up off the floor. Everybody worked all the time and seemed to enjoy it. When the kids weren't working they were doing lessons and the boys were punished when they weren't up on their lessons by being required to stay in from the fields.

Mama would listen to them recite while she cooked. Sometimes she listened to lessons in things I'm pretty sure she never had studied herself, but Papa Schultz checked up on them, too, so it didn't matter.

Me, I learned about pigs. And cows. And chickens. And how you breed pay dirt to make more pay dirt. "Pay dirt" is the stuff that is actually imported from Earth, concentrated soil cultures with the bacteria and so forth in it you have to have to get a field alive.

There was an awful lot to learn. Take cows, now–half the people you meet can't tell their left hands from their right so who would think that a cow would care about such things? But they do, as I found out when I tried to milk one from the left.

Everything was stoop labor around the place, as primitive as a Chinese farm. The standard means of transportation was a wheelbarrow.

I learned not to sneer at a wheelbarrow after I priced one at the

Exchange.

The total lack of power machinery wasn't through lack of power; the antenna on the farm house roof could pick up as much power as necessary—but there wasn't any machinery. The only power machinery in the colony belonged to the whole colony and was the sort of thing the colony absolutely couldn't get along without, like rock chewers and the equipment for the heat trap and the power plant itself.

George explained it this way: every load that was sent up from Earth was a compromise between people and cargo. The colonists were always yapping for more machinery and fewer immigrants; the Colonial Commission always insisted on sending as many people as possible and holding the imports down to a minimum.

"The Commission is right, of course," he went on. "If we have people, we'll get machinery—we'll make it ourselves. By the time you have a family of your own, Bill, immigrants will arrive here barehanded, no cargo at all, and we'll be able to outfit a man with everything from plastic dishes for his cupboard to power cultivators for his fields."

I said, "If they wait until I have a family, they'll have a long wait. I figure a bachelor travels faster and further."

Dad just grinned, as if he knew something I didn't know and wouldn't tell. I had walked into town to have dinner with him and Molly and the kid. I hadn't seen much of them since I went to work for Papa Schultz. Molly was teaching school, Peggy couldn't come out to the farm, of course, and Dad was very busy and very excited over a strike of aluminum oxides twenty miles east of town. He was in the project up to his ears and talking about having sheet aluminum on sale in another G-year.

As a matter or fact, cultivating a farm by stoop labor wasn't too bad, not on Ganymede. Low gravity was a big help; you didn't wear yourself out just dragging your own carcass around. I grossed a hundred and forty-two mass pounds, what with the way Mama Schultz stuffed me; that meant I weighed less than fifty pounds, field boots and all A wheelbarrow was similarly light when loaded.

But the real advantage that made the work easy was something you might not guess.

No weeds.

No weeds at all; we had very carefully not imported any. Once the land was built, making a crop was darn near a case of poking a seed into the ground and then stepping back quick before the stalk shot up and hit you in the eye.

Not that we didn't work. There is plenty of work around a farm even with no weeds to worry about. And a light wheelbarrow load simply meant that we piled three times as much on. But we had fun, too; I never met a family that laughed so much.

I brought my squeeze box out from town and used to play it after supper. We would all sing, with Papa Schultz booming away on his own and leaving it up to the rest of us to find the key he was singing in. We had fun.

It turned out that Gretchen was an awful tease when she got over being shy. But I could always get her goat by pretending that her head was on fire and either warming my hands over her hair or threatening to pour water on her before she burned the place down.

The day finally came when it was my turn to have the colony's crushers work on my land and I was almost sorry to see it arrive; I had had such a nice time at the Schultz's. But by then I could caponize a rooster or plant a row of corn; I still had a lot to learn, but there wasn't any good reason why I shouldn't start making my own farm.

Dad and I had had to prepare our farm for the crusher by dynamiting the biggest boulders. A crusher will choke on anything much bigger than a barrel but it will handle up to that size very nicely. Dynamite is cheap, thank goodness, and we used plenty of it. The raw material is nitroglycerine which we didn't have to import from Earth, the glycerine being refined from animal fats and the nitric acid being a synthetic byproduct of the atmosphere project.

Dad spent two weekends with me, making medium-sized ones out of big ones, then decided it was safe to trust me to set powder by myself and I finished the job. There was a little stream of melted snow water coming down from the hills at the far side of our property; we blew out a new bed for it to lead it close to the place where the house would go. We left it dry for the time being, with a natural rock dam to blow up later. One fair-sized hill we moved entirely and blew it into a gully on the lake side of the land. Big charges that took and I almost got fitted for a halo through underestimating how far some of the stuff would throw.

It was easy work and lots of fun. I had a vibro-drill, borrowed from the engineer's office; you could sink a charge hole with it twenty feet into rock as easily as you could sink a hot knife into butter. Then drop in the powder, fill the rest of the hole with rock dust, light the fuse, and run like the dickens!

But the most fun was blowing up that rock that looked like a grinning skull. I fixed it properly, it and its leer!

We had a visitor while we were dynamiting the land. Dad and I had just knocked off for lunch one day when Saunders, "The One-Man Lobby"—that's George's name for him—showed up. We invited him to share what we had; he had brought nothing but his appetite.

He complained about this and that. Dad tried to change the subject by asking him how he was getting along with his blasting. Saunders said it was slow work. Dad said, "You have the crusher the day after us, don't you?"

Saunders admitted it and said he wanted to borrow some powder; he was running short of time. Dad let him have it, though it meant another trip out from town, after work, for him the next day. Saunders went on, "I've been looking this situation over, Mr. Lermer. We're tackling it all wrong."

George said, "So?"

Saunders said, "Yes, indeedy! Now in the first place this blasting ought not to be done by the homesteader; it should be done by trained crews, sent out by the government. It's really part of the contract anyway; we're supposed to receive processed land."

Dad said mildly that, while that might be a nice idea, he didn't know where they would find enough trained crews to do the work for fifteen hundred new farms.

"Let the government hire them!" Mr. Saunders answered. "Bring them in from Earth for that purpose. Now, see here, Mr. Lermer, you are in the chief engineer's office. You ought to put in a word for the rest of us."

George picked up the vibro and got ready to set a charge. Presently he answered, "I'm afraid you've come to the wrong party. I'm in an entirely different department."

I guess Mr. Saunders saw he was off on the wrong tack for he went on, "In the second place, I have been looking into the matter of the soil, or what they call 'soil'—again they are off on the wrong foot." He kicked a rock. "This stuff isn't good for anything. You can't grow anything in stuff like that."

"Naturally not," agreed Dad. "You have to make soil first."

"That's just what I'm getting at," Saunders went on. "You have to have soil—good, black, rich soil. So they tell us to breed it, a square foot at a time. Plough garbage into it, raise earthworms—I don't know how many tomfool stunts."

"Do you know of a better way?"

"You bet you I do! That's just what I'm getting at. Here we are, piddling along, doing things the way a bunch of bureaucrats who never made a crop tell us to, all for a few inches of second-rate soil—when there are millions of cubic feet of the richest sort of black soil going begging."

Dad looked up sharply. "Where?"

"In the Mississippi Delta, that's where! Black soil goes down there for hundreds of feet."

We both looked at him, but he was quite serious about it. "Now here's what you've got to have—Level the ground off, yes. But after that spread real Earth soil over the rock to a depth of at least two feet; then it will be worth while to farm. As it is, we are just wasting our time."

Dad waited a bit before answering, "Have you figured out what this would cost?"

Mr. Saunders brushed that aside. "That's not the point; the point is, that's what we've got to have. The government wants us to settle here, doesn't it? Well, then, if we all stick together and insist on it, we'll get it." He jerked his chin triumphantly.

George started to say something, then stopped. He patted rock dust in on top of his charge, then straightened up and wiped the sweat off his beard. "Listen, citizen," he said, "can't you see that we are busy? I'm about to light this fuse; I suggest that you back away out of danger."

"Huh?" said Saunders. "How big a charge is it? How far?"

If he had kept his eyes open, he would have seen how big a charge it was and known how far to give back. Dad said, "Oh, say a mile and a half—or even two miles. And keep backing."

Saunders looked at him, snorted disgustedly, and stalked away. We backed out of range and let her blow.

While we were setting the next charge I could see George's lips moving. After a while he said, "Figuring gumbo mud conservatively at a hundred pounds per cubic foot it would take one full load of the *Mayflower* to give Mr. Saunders alone the kind of a farm he would like to have handed to him. At that rate it would take just an even thousand G-years—five hundred Earth years—for the *Mayflower* to truck in topsoil for farms for our entire party."

"You forgot the Covered Wagon," I said brightly.

George grinned. "Oh, yes! When the Covered Wagon is commissioned and in service we could cut it down to two hundred and fifty years—provided no new immigrants came in and there was a ban on having babies!" He frowned and added, "Bill, why is it that some apparently-grown men never learn to do simple arithmetic?" I didn't know the answer, so he said, "Come on, Bill, let's get on with our blasting. I'm afraid we'll just have to piddle along in our inefficient way, even if it doesn't suit our friend Saunders."

The morning the crusher was scheduled to show up I was waiting for it at the end of the road. It came breezing down the road at twenty miles an hour, filling it from side to side. When it came to the wall of lava, it stopped. I waved to the operator; he waved back, then the machine grunted a couple of times, inched forward, and took a bite out of the lava.

Lava didn't bother it; it treated it like peanut brittle. A vibro-cutter built into its under carriage would slice under the flow like a housewife separating biscuit from a pan, the big steel spade on the front of the thing would pry under and crack the bite off, and the conveyor would carry the chunk up into the jaws.

The driver had a choice of dropping the chewed up material under the rear rollers or throwing it off to the side. Just now he was throwing it away, leaving the clean slice made by the vibro-cutter as a road bed —a good road, a little dusty but a few rains would fix that.

It was terrifically noisy but the driver didn't seem to mind. He seemed to enjoy it; there was a good breeze taking the dust away from him and he had his anti-silicosis mask pushed up on his forehead, showing the grin on his face.

By noon he was down to our place and had turned in. We had a bite to eat together, then he started in levelling a farm for me—five acres, the rest would have to wait. At that I was lucky for I was to get land to work months ahead of the original schedule. The second trip of the *Mayflower* had brought in three more crushers and very few immigrants, just enough to replace those who had given up and gone back out of our party, that being the compromise the town council had worked out with the Colonial Commission.

The racket was still worse when the crusher bit into hard rock, instead of lava, but it was music to me and I didn't get tired of watching. Every bite was a piece of land to me. At suppertime the second-shift driver showed up with Dad. We watched together for a while, then Dad went back to town. I stayed. About midnight I went over into a stretch that was not to be processed now, found a big rock to keep the Sun out of my eyes and lay down for a quick nap.

Then the relief driver was shaking me and saying, "Wake up, kid—you got a farm."

I stood up and rubbed my eyes and looked around. Five acres, with just enough contour for drainage and a low hummock in the middle where the house would sit. I had a farm.

The next logical thing to do would have been to get the house up, but, under the schedule, I rated the use of a cud-chewer for the following week. A cud-chewer is a baby rock crusher. It uses a power pack instead of an antenna, it is almost fool proof and anybody can run one, and it finishes up what the crusher starts. It is small and low-powered compared with a crusher. The colony had about forty of them.

The crusher left loose rubble several feet deep in pieces as big as my fist. The cud-chewer had a fork spade on the front of it, several sizes of spade forks, in fact. The coarse fork went down into the loose rocks about eighteen inches and picked up the big ones. These drifted back into the hopper as the machine moved forward and were busted into stuff about the size of walnuts.

When you had been over the ground once with the coarse fork, you unshipped it and put on the medium fork and reset the chewing rollers. This time you went down only ten inches and the result was gravel. Then you did it again for medium-fine and then fine and when you were done the upper six inches or so was rock flour, fine as the best loam—still dead, but ready to be bred into life.

Round and round and round, moving forward an inch at a time. To get real use out of your time allotment the cud-chewer had to be moving twenty-four hours a day until they took it away from you. I stayed at it all through the first day, eating my lunch in the saddle. Dad spelled me after supper and Hank came out from town and we alternated through the nightlight phase it was, actually, it being Monday night.

Papa Schultz found me asleep with my head on the controls late next afternoon and sent me back to his house to get some real sleep. Thereafter one of the Schultzes always showed up when I had been at it alone for four or five hours. Without the Schultzes I don't know how Dad and I would have gotten through the dark phase of that week.

But they did help and by the time I had to pass the cud-chewer along I had nearly three and a half acres ready to be seeded with pay dirt.

Winter was coming on and I had my heart set on getting my house up and living in it during the winter month, but to do so I really had to hump. I had to get some sort of a holding crop in or the spring thaw would wash my top soil away. The short Ganymede year is a good idea and I'm glad they run it that way; Earth's winters are longer than necessary. But it keeps you on the jump.

Papa Schultz advised grass; the mutated grass would grow in sterile soil much like growing things in hydroponic solutions. The mat of rootlets would hold my soil even if the winter killed it and the roots would furnish something through which the infection could spread from the "pay dirt."

Pay dirt is fundamentally just good black soil from Earth, crawling with bacteria and fungi and microscopic worms—everything you need but the big fishing worms; you have to add those. However, it wouldn't do simply to ship Earth dirt to Ganymede by the car load. In any shovelful of loam there are hundreds of things, plant and animal, you need for growing soil—but there are hundreds of other things you don't want. Tetanus germs. Plant disease viruses. Cut worms. Spores. Weed seeds. Most of them are too small to be seen with the naked eye and some of them can't even be filtered out

So to make pay dirt the laboratory people back on Earth would make pure cultures of everything they wanted to keep in the way of bacteria, raise the little worms under laboratory conditions, do the same for fungi and everything else they wanted to save—and take the soil itself and kill it deader than Luna, irradiate it, bake it, test it for utter sterility. Then they would take what they had saved in the way of life forms and put it back into the dead soil That was "pay dirt," the original pay dirt. Once on Ganymede the original stuff would be cut six ways, encouraged to grow, then cut again. A hundred weight of pay dirt supplied to a ‘steader might contain a pound of Terra's own soil.

Every possible effort was made to "limit the invasion," as the ecologists say, to what was wanted. One thing that I may not have mentioned about the trip out was the fact that our clothes and our baggage were sterilized during the trip and that we ourselves were required to take a special scrub before we put our clothes back on. It was the only good bath I got the whole two months, but it left me smelling like a hospital.

The colony's tractor trucks delivered the pay dirt I was entitled to in order to seed my farm; I left the Schultz place early that morning to meet them. There is difference of opinion as to the best way to plant pay dirt; some 'steaders spread it all over and take a chance on it dying; some build up little pockets six or eight feet apart, checker board style… safe but slow. I was studying the matter, my mind not made up, when I saw something moving down the road.

It was a line of men, pushing wheelbarrows, six of them. They got closer and I could see that it was all the male Schultzes. I went out to meet them.

Every one of those wheelbarrows was loaded with garbage and all for me!

Papa Schultz had been saving it as a surprise for me. I didn't know what to say. Finally I blurted out, "Gee, Papa Schultz, I don't know when I'll be able to pay you back!"

He looked fierce and said, "Who is speaking of paying back when we have compost running out of our ears yet?" Then he had the boys dump their loads down on top of my pay dirt, took a fork and began mixing it as gently as Mama Schultz folding in beaten egg white.

He took charge and I didn't have to worry about the best way to use it. In his opinion—and you can't bet that I didn't buck itl—what we had was good for about an acre and his method was to spread it through the soil. But he did not select one compact acre; he laid out strips, seven of them, a couple of hundred yards long each and stretching across my chewed soil thirty-five or forty feet apart. Each of us took a wheelbarrow—their six and my one—and distributed the mix along each line.

When that was done and cairns had been set to show where the strips ran, we raked the stuff into the rock dust five or six feet on each side of each line. Around noon Mama and Gretchen showed up, loaded down, and we stopped and had a picnic.

After lunch Yo had to go back to town but he had almost finished his strip. Papa had finished his and proceeded to help Hugo and Peter who were too small to swing a good rake. I dug in and finished mine soon enough to be able to finish what Yo had left. Dad showed up at the end of the day, expecting to help me all evening—it was light phase and you could work as late as you could stand up under it— but there was nothing left to do. And he didn't know how to thank them either.

I like to think that we would have gotten the farm made anyhow, without the Schultzes, and maybe we would have—but I'm sure not sure. Pioneers need good neighbors.

The following week I spent working artificial nitrates from the colony's power pile into the spaces between the strips—not as good as pay dirt from Earth, but not as expensive, either.

Then I tackled sowing the grass, by hand, just like in the Bible, and then raking it gently in. That old pest Saunders showed up. He still did so every now and then, but never when Dad was around. I guess he was lonely. His family was still in town and he was camping out in a ten-foot rock shed he had built. He wasn't really making a farm, not properly; I couldn't figure out what he was up to. It didn't make sense.

I said, "Howdy," and went on with my work.

He watched me, looking sour, and finally said, "You still bent on breaking your heart on this stuff, aren't you, youngster?"

I told him I hadn't noticed any wear and tear on my pump, and anyhow, wasn't he making a farm, too?

He snorted. "Not likely!"

"Then what are you doing?"

"Buying my ticket, that's what."

"Huh?"

"The only thing you can sell around this place is improved land. I'm beating them at their own game, that's what. I'll get that land in shape to unload it on some other sucker and then me and mine are heading straight back for that ever-lovin' Earth. And that's just what you'll be doing if you aren't an utter fool. You'll never make a farm here. It can't be done."

I was getting very tired of him but I'm short on the sort of point-blank guts it takes to be flatly rude. "Oh, I don't know," I said. "Look at Mr. Schultz—he's got a good farm."

Saunders snorted again. "You mean 'Johnny Appleseed?"

"I mean Mr. Johann Schultz."

"Sure, sure—Johnny Appleseed. That's what everybody calls him in town. He's nuts. You know what he did? He gave me a handful of apple seeds and acted like he had handed me the riches of Solomon."

I stopped raking. "Well, hadn't he?"

Saunders spat on the ground between us. "He's a clown."

I lifted up the head of the rake. I said, "Mr. Saunders, you are standing on my land, my property. I'll give you just two shakes to get off it and never set foot on it again!"

He backed away and said, "Hey! You stop that! Watch what you are doing with that rake!"

I said, "Git!"

He got.

The house was a problem. Ganymede has little quakes all the time. It has to do with "isostasy" which doesn't mean a thing but "equal-pressure" when you get right down to it, but it's the science of how the mountains balance the seas and the gravitation of a planet all comes out even.

It has to do with tidal strains, too, which is odd, since Ganymede doesn't have any tides; the Sun is too far away to matter and Ganymede always keeps the same face toward Jupiter. Oh, you can detect a little tide on Laguna Serenidad when Europa is closest to Ganymede and even a trifle from Callisto and lo, but what I mean is it doesn't have tides—not like the Pacific Ocean.

What it does have is a frozen tidal strain. The way Mr. Hooker, the chief meteorologist, explains it is that Ganymede was closer to Jupiter when it cooled off and lost its rotation, so that there is a tidal bulge in the planet itself—sort of a fossil tidal bulge. The Moon has one, you know.

Then we came along and melted off the ice cap and gave Ganymede an atmosphere. That rearranged the pressures everywhere and the isostatic balance is readjusting. Result: little quakes all the time.

I'm a California boy; I wanted a quakeproof house. Schultzes had a quakeproof house and it seemed like a good idea, even though there had never been a quake heavy enough to knock a man down, much less knock a house down. On the other hand most of the colonists didn't bother; it is hard to make a rock house really quakeproof.

Worse than that, it's expensive. The basic list of equipment that a 'steader is promised in his emigration contract reads all right, a hoe, a spade, a shovel, a wheelbarrow, a hand cultivator, a bucket, and so forth down the list—but when you start to farming you find that is only the beginning and you've got to go to the Exchange and buy a lot of other stuff. I was already in debt a proved acre and a half, nearly, before the house ever went up.

As usual we compromised. One room had to be quake proof because it had to be air tight—Peggy's room. She was getting better all the time, but she still couldn't take low pressure for any length of time. If the family was going to move out to the farm, her bedroom had to be sealed, it had to have an air lock on it, and we had to have an impeller. All that runs into money.

Before I was through I had to pledge two more acres. Dad tried to sign for it but they told him bluntly that while a 'steader's credit was good, his wasn't. That settled the matter. We planned on one reinforced room and hoped to build on to it later. In the mean time the house would be a living room, ten by twelve, where I would sleep, a separate bedroom too small to swing a cat for George and Molly, and Peggy's room. All but Peggy's room would be dry wall rock with a patent roof.

Pretty small, eh? Well, what's wrong with that? Abe Lincoln started with less.

I started in cutting the stone as soon as the seed was in. A vibro-saw is like a vibro-drill, except that it cuts a hair line instead of drilling a hole. When the power is on you have to be durned careful not to get your fingers or anything into the field, but it makes easy work of stone cutting. By the contract you got the use of one for fortyeight hours free and another fortyeight hours, if you wanted it, at a reduced rate. I got my work lined up and managed to squeeze it into the two free days. I didn't want to run up any more debt, because there was another thing I was hankering for, come not later than the second spring away—flicker flood lights. Papa Schultz had them for his fields and they just about doubled his crops. Earth plants aren't used to three and half days of darkness, but, if you can tickle them during the dark phase with flicker lights, the old photosynthesis really gets in and humps itself.

But that would have to wait.

The patrol got the house up—the patrol I was in, I mean, the Auslanders. It was a surprise to me and yet it wasn't, because everybody has a house raising; you can't do it alone. I had already taken part in six myself—not just bigheartedness, don't get me wrong. I had to learn how it was done.

But the patrol showed up before I had even passed the word around that I was ready to hold a house raising. They came swinging down our road; Sergei marched them up to where the house was to be, halted them, and said to me, "Bill, are your Scout dues paid up?" He sounded fierce. I said, "You know they are."

"Then you can help. But don't get in our way." Suddenly he grinned and I knew I had been framed. He turned to the patrol and shouted, "House raising drill! Fall out and fall to."

Suddenly it looked like one of those TV comedies where everything has been speeded up. I never saw anybody work the way they did. Let me tell you it doesn't take Scout uniforms to make Scouts. None of us ever had uniforms; we couldn't afford special clothes just for Scouting.

Besides the Auslanders there was Vic Schultz and Hank Jones, both from the Hard Rock patrol and Doug Okajima, who wasn't even of our troop but still with the Baden-Powell. It did my heart good. I hadn't seen much of the fellows lately; during light phase I always worked too late to get in to meetings; during dark phase a cold nine miles into town after supper is something to think twice about.

I felt sheepish to realize that while I might have forgotten them, they hadn't forgotten me, and I resolved to get to meetings, no matter how tired I was. And take the tests for those two merit badges, too—the very first chance I got.

That reminded me of another item of unfinished business, too—Noisy Edwards. But you can't take a day off just to hunt somebody up and poke him in the snoot, not when you are making a farm. Besides it wouldn't hurt anything for me to put on another ten pounds; I didn't want it to be a repetition of the last time.

Dad snowed up almost immediately with two men from his office and he took charge of bracing and sealing Peggy's room. The fact that he showed up at all let me know that he was in on it—which he admitted. It had been Sergei's idea and that was why Dad had put me off when I said it was about time to invite the neighbors in.

I got Dad aside. "Look, George," I said, "how in nation are we going to feed 'em?"

"Don't worry about it," he said.

"But I do worry about it!" Everybody knows it's the obligation of the 'steader whose house is being raised to provide the victuals and I had been taken by surprise.

"I said not to," he repeated. And presently I knew why; Molly showed up with Mama Schultz, Gretchen, Sergei's sister Marushka, and two girls who were friends of Peggy—and what they were carrying they couldn't have carried on Earth. It was a number one picnic and Sergei had trouble getting them back to work after lunch.

Theoretically, Molly had done the cooking over at the Schultz's but I know Mama Schultz—anyhow, let's face it, Molly wasn't much of a cook.

Molly had a note for me from Peggy. It read: "Dearest Billy, Please come into town tonight and tell me all about it. Pretty please!" I told Molly I would.

By eighteen o'clock that afternoon the roof was on and we had a house. The door wasn't hung; it was still down at the 'Change. And the power unit wasn't in and might not be for a week. But we had a house that would keep off the rain, and a pint-sized cow barn as well, even if I didn't own a cow.

15. Why Did We Come?

According to my diary we moved into the house on the first day of spring.

Gretchen came over and helped me get ready for them. I suggested that we ask Marushka as well, since there would be lots of work to do. Gretchen said, "Suit yourself!" and seemed annoyed, so I didn't. Women are funny. Anyhow Gretchen is a right good worker.

I had been sleeping in the house ever since the raising and even before the technicians from the engineer's office had come and installed the antenna on the roof and rigged the lights and heat—but that was done before winter was started and I passed a comfortable month, fixing up the inside of the place and getting in a crop of ice for the summer. I stored the ice, several tons of it, in the gully at the side of the house, where I meant to plant apple trees just as soon as I could get fixed for it. The ice would keep there until I could build a proper cold cellar.

The first few months after the folks moved out are the happiest I can remember. We were together again and it was good. Dad still spent most of each dark phase in town, working on a part time basis, but that was quite as much because he was interested in the manufacturing project as it was to help pay off our debts. During light phase we worked almost around the clock, side by side or at least within earshot.

Molly seemed to like being a housewife. I taught her how to cook and she caught on real fast. Ganymede cooking is an art. Most things have to be cooked under pressure, even baked things, for water boils at just a little over a hundred and forty degrees. You can stir boiling water with your finger if you don't leave it in too long. Then Molly started learning from Mama Schultz but I didn't mind that; Mama Schultz was an artist. Molly got to be a really good cook.

Peg had to live in her room, of course, but we had hopes that she would be out soon. We had the pressure down to eight pounds, half oxygen and half nitrogen, and we usually all ate in her room. I still hated the thick stuff but it was worth while putting up with it so that the family could eat together. After a while I got so that I could change pressure without even an earache.

Peggy could come outside, too. We had brought her from town in a bubble stretcher—another thing bought on credit!—and Dad had fitted it with the gas apparatus from an old space suit he had salvaged from the Project Jove people. Peggy could get into the stretcher and shut herself in and we could bleed off the pressure in her room and take her outside where she could get some sunshine and look at the mountains and the lake and watch Dad and me work in the fields. The clear plastic of the bubble did not stop ultraviolet and it was good for her.

She was a skinny little runt and it was no trouble to move her around, even in the stretcher. Light phase, she spent a lot of time outdoors.

We had started with a broody hen and fifteen fertile eggs, and a pair of rabbits. Pretty soon we had meat of our own. We always let Peggy think that the fryers we ate came from the Schultzes and I don't think she ever caught on. At first I used to go to the Schultz farm every day for fresh milk for Peggy, but I got a chance, midsummer, to get a fresh two-year-old cow on tick at a reasonable price. Peggy named her Mabel and was much irked that she couldn't get at her to pet her.

We were on the move all the time. I still hadn't managed to take my merit badge tests and I hadn't done much better about getting in to Scout meetings. There was just too much to do. Building a pond, for example—Laguna Serenidad was being infected with plankton and algae but there weren't fish in it yet and it would be a long time, even after the fish were stocked, before fishing would be allowed. So we did fishpond gardening, Chinese style, after I got the pond built.

And there were always crops to work on. My cover grass had taken hold all right and shortly after we moved in the soil seemed ready to take angle worms. Dad was about to send a sample into town for analysis when Papa Schultz stopped by. Hearing what we were about he took up a handful of the worked soil, crumbled it, smelled it, tasted it, and told me to go ahead and plant my worms. I did and they did all right; we encountered them from time to time in working the fields thereafter.

You could see the stripes on the fields which had been planted with pay dirt by the way the grass came up. You could see that the infection was spreading, too, but not much. I had a lot of hard work ahead before the stripes would meet and blend together and then we could think about renting a cud-chewer and finishing off the other acre and a half, using our own field loam and our own compost heap to infect the new soil. After that we could see about crushing some more acres, but that was a long way away.

We put in carrots and lettuce and beets and cabbage and brussels sprouts and potatoes and broccoli. We planted corn between the rows. I would like to have put in an acre of wheat but it didn't make sense when we had so little land. There was one special little patch close to the house where we put in tomatoes and Hubbard squash and some peas and beans. Those were "bee" plants and Molly would come out and pollenate them by hand, a very tedious business. We hoped to have a hive of bees some day and the entomologists on the bionomics staff were practically busting their hearts trying to breed a strain of bees which would prosper out doors. You see, among other things, while our gravity was only a third Earth-normal, our air pressure was only a little better than a fifth Earth-normal and the bees resented it; it made flying hard work for them. Or maybe bees are just naturally conservative.

I guess I was happy, or too tired and too busy to be unhappy, right up to the following winter.

At first winter seemed like a good rest. Aside from getting the ice crop in and taking care of the cow and the rabbits and the chickens there wasn't too much to do. I was tired out and cranky and didn't know it; Molly, I think, was just quietly, patiently exhausted. She wasn't used to farm life and she wasn't handy at it, the way Mama Schultz was.

Besides that, she wanted inside plumbing and it just wasn't in the cards for her to have it any time soon. I carried water for her, of course, usually having to crack ice in the stream to get it, but that didn't cover everything, not with snow on the ground. Not that she complained.

Dad didn't complain, either, but there were deep lines forming from his nose down to his mouth which his beard didn't cover entirely. But it was mostly Peggy.

When we first moved her out to the farm she perked up a lot. We gradually reduced the pressure in her room and she kept insisting that she was fine and teasing for a chance to go out without the bubble stretcher. We even tried it once, on Dr. Archibald's advice, and she didn't have a nose bleed but she was willing to get back in after about ten minutes.

The fact was she wasn't adjusting. It wasn't just the pressure; something else was wrong. She didn't belong here and she wouldn't grow here. Have you ever had a plant that refused to be happy where you planted it? It was like that.

She belonged back on Earth.

I suppose we weren't bad off, but there is a whale of a difference between being a rich farmer, like Papa Schultz, with heaps of cow manure in your barn yard and hams hanging in your cold cellar and every modern convenience you could want, even running water in your house, and being poor farmers, like us, scratching for a toe hold in new soil and in debt to the Commission. It told on us and that winter we had time to brood about it.

We were all gathered in Peggy's room after lunch one Thursday.

Dark phase had just started and Dad was due to go back into town; we always gave him a send off. Molly was darning and Peg and George were playing cribbage. I got out my squeeze box and started knocking out some tunes. I guess we all felt cheerful enough for a while. I don't know how I happened to drift into it, but after a bit I found I was playing The Green Hills of Earth. I hadn't played it in a long time.

I brayed through that fortissimo part about "Out ride the sons of Terra; Far drives the thundering jet—" and was thinking to myself that jets didn't thunder any more. I was still thinking about it when I went on into the last chorus, the one you play very softly: "We pray for one last landing on the globe that gave us birth—"

I looked up and there were tears running down Molly's cheeks.

I could have kicked myself. I put my accordion down with a squawk, not even finishing, and got up. Dad said, "What's the matter, Bill?"

,I muttered something about having to go take a look at Mabel.

I went out into the living room and put on my heavy clothes and actually did go outside, though I didn't go near the barn. It had been snowing and it was already almost pitch dark, though the Sun hadn't been down more than a couple of hours. The snow had stopped but there were clouds overhead and you couldn't see Jupiter.

The clouds had broken due west and let the sunset glow come through a bit. After my eyes adjusted, by that tiny amount of light I could see around me—the mountains, snow to their bases, disappearing in the clouds, the lake, just a sheet of snow-covered ice, and the boulders beyond our fields, making weird shapes in the snow. It was a scene to match the way I felt; it looked like the place where you might be sent for having lived a long and sinful life.

I tried to figure out what I was doing in such a place.

The clouds in the west shifted a little and I saw a single bright green star, low down toward the horizon, just above where the Sun had set.

It was Earth.

I don't know how long I stood there. Presently somebody put a hand on my shoulder and I jumped. It was Dad, all bundled up for a nine-mile tramp through the dark and the snow.

"What's the matter, Son?" he said.

I started to speak, but I was all choked up and couldn't. Finally I managed to say, "Dad, why did we come here?"

"Mmmm… you wanted to come. Remember?"

"I know," I admitted.

"Still, the real reason, the basic reason, for coming here was to keep your grandchildren from starving. Earth is overcrowded, Bill."

I looked back at Earth again. Finally I said, "Dad, I've made a discovery. There's more to life than three square meals a day. Sure, we can make crops here— this land would grow hair on a billiard ball. But I don't think you had better plan on any grandchildren here; it would be no favor to them. I know when I've made a mistake."

"You're wrong, Bill, Your kids will like this place, just the way Eskimos like where they live."

"I doubt it like the mischief."

"Remember, the ancestors of Eskimos weren't Eskimos; they were immigrants, too. If you send your kids back to Earth, for school, say, they'll be homesick for Ganymede. They'll hate Earth. They'll weigh too much, they won't like the air, they won't like the climate, they won't like the people."

"Hmm—look, George, do you like it here? Are you glad we came?"

Dad was silent for a long time. At last he said, "I'm worried about Peggy, Bill."

"Yeah, I know. But how about yourself—and Molly?"

"I'm not worried about Molly. Women have their ups and downs. You'll learn to expect that." He shook himself and said, "I'm late. You go on inside and have Molly fix you a cup of tea. Then take a look at the rabbits. I think the doe is about to drop again; we don't want to lose the young 'uns." He hunched his shoulders and set off down toward the road. I watched him out of sight and then went back inside.

16. Line Up

Then suddenly it was spring and everything was all right.

Even winter seemed like a good idea when it was gone. We had to have winter; the freezing and thawing was necessary to develop the ground, not to mention the fact that many crops won't come to fruit without cold weather. Anyway, anybody can live through four weeks of bad weather.

Dad laid off his job when spring came and we pitched in together and got our fields planted. I rented a power barrow and worked across my strips to spread the living soil. Then there was the backbreaking job of preparing the gully for the apple trees. I had started the seeds soon after Papa Schultz had given them to me, forcing them indoors, first at the Schultz's, then at our place. Six of them had germinated and now they were nearly two feet tall.

I wanted to try them outdoors. Maybe I would have to take them in again next winter, but it was worth a try.

Dad was interested in the venture, too, not just for fruit trees, but for lumber. Wood seems like an obsolete material, but try getting along without it.

I think George had visions of the Big Rock Candy Mountains covered with tall straight pines… someday, someday.

So we went deep and built it to drain and built it wide and used a lot of our winter compost and some of our precious topsoil. There was room enough for twenty trees when we got through, where we planted our six little babies. Papa Schultz came over and pronounced a benediction over them.

Then he went inside to say hello to Peggy, almost filling her little room. George used to say that when Papa inhaled the pressure in the room dropped.

A bit later Papa and Dad were talking in the living room; Dad stopped me as I was passing through. "Bill," he asked, "how would you like to have a window about here?" He indicated a blank wall.

I stared. "Huh? How would we keep the place warm?"

"I mean a real window, with glass."

"Oh." I thought about it. I had never lived in a place with windows in my life; we had always been apartment dwellers. I had seen windows, of course, in country houses back Earthside, but there wasn't a window on Ganymede and it hadn't occurred to me that there ever would be.

"Papa Schultz plans to put one in his house. I thought it might be nice to sit inside and look out over the lake, light phase evenings," Dad went on.

"To make a home you need windows and fireplaces," Papa said placidly. "Now that we glass make, I mean to have a view."

Dad nodded. "For three hundred years the race had glazed windows. Then they shut themselves up in little airconditioned boxes and stared at silly television pictures instead. One might as well be on Luna."

It was a startling idea, but it seemed like a good one. I knew they were making glass in town. George says that glassmaking is one of the oldest manufacturing arts, if not the oldest, and certainly one of the simplest. But I had thought about it for bottles and dishes, not for window glass. They already had glass buckets on sale at the 'Change, for about a tenth the cost of the imported article.

A view window—it was a nice idea. We could put one on the south and see the lake and another on the north and see the mountains. Why, I could even put in a skylight and lie on my bunk and see old Jupiter.

Stow it, William, I said to myself; you'll be building a whole house out of glass next. After Papa Schultz left I spoke to George about it. "Look," I said, "about this view window idea. It's a good notion, especially for Peggy's room, but the question is: can we afford it?"

"I think we can," he answered.

"I mean can we afford it without your going back to work in town? You've been working yourself to death —and there's no need to. The farm can support us now."

He nodded. "I had been meaning to speak about that. I've about decided to give up the town work, Bill—except for a class I'll teach on Saturdays."

"Do you have to do that?"

"Happens that I like to teach engineering, Bill And don't worry about the price of the glass; well get it free—a spot of cumshaw coining to your old man for designing the glass works. "The kine who tread the grain,'" he quoted. "Now you and I had better get busy; there is a rain scheduled for fifteen o'clock.'

It was maybe three weeks later that the moons lined up. This is an event that almost never happens, Ganymede, Callisto, Io, and Europa, all perfectly lined up and all on the same side of Jupiter. They come close to lining up every seven hundred and two days, but they don't quite make it ordinarily. You see, their periods are all different, from less than two days for Io to more than two weeks for Callisto and the fractions don't work out evenly. Besides that they have different eccentricities to their orbits and their orbits aren't exactly in the same plane.

As you can see, a real line up hardly ever happens.

Besides that, this line up was a line up with the Sun, too; it would occur at Jupiter full phase. Mr. Hooker, the chief meteorologist, announced that it had been calculated that such a perfect line up would not occur again for more than two hundred thousand years. You can bet we were all waiting to see it. The Project Jove scientists were excited about it, too, and special arrangements had been made to observe it.

Having it occur at Jupiter full phase meant not only that a sixth heavenly body—the Sun—would be in the line up, but that we would be able to see it. The shadows of Ganymede and Callisto would be centered on Jupiter just as Io and Europa reached mid transit.

Full phase is at six o'clock Saturday morning; we all got up about four-thirty and were outside by five. George and I carried Peggy out in her bubble stretcher. We were just in time.

It was a fine, clear summer night, light as could be, with old Jupiter blazing overhead like a balloon on fire. Io had just barely kissed the eastern edge of Jupiter—"first contact" they call it. Europa was already a bit inside the eastern edge and I had to look sharp to see it. When a moon is not in full phase it is no trouble to pick it out while it's making its transit, but at full phase it tends to blend into the background. However, both Ioand Europa are just a hair brighter than Jupiter. Besides that, they break up the pattern of Jupiter's bands and that lets you see them, too.

Well inside, but still in the eastern half—say about half way to Jupiter's center point—were the shadows of Ganymede and Callisto. I could not have told them apart, if I hadn't known that the one further east had to be Ganymede's. They were just little round black dots; three thousand miles or so isn't anything when it's plastered against Jupiter's eighty-nine thousand mile width.

Io looked a bit bigger than the shadows; Europa looked more than half again as big, about the way the Moon looks from Earth.

We felt a slight quake but it wasn't even enough to make us nervous; we were used to quakes. Besides that, about then Io"kissed" Europa. From then on, throughout the rest of the show, Io gradually slid underneath, or behind, Europa.

They crawled across the face of Jupiter; the moons fairly fast, the shadows in a slow creep. When we had been outside a little less than half an hour the two shadows kissed and started to merge. Io had slid halfway under Europa and looked like a big tumor on its side. They were almost halfway to center and the shadows were even closer.

Just before six o'clock Europa—you could no longer see Io; Europa covered it—as I was saying, Europa kissed the shadow, which by now was round, just one shadow.

Four or five minutes later the shadow had crawled up on top of Europa; they were all lined up—and I knew I was seeing the most extraordinary sight I would ever see in my life, Sun, Jupiter, and the four biggest moons all perfectly lined up.

I let out a deep breath: I don't know how long I had been holding it. "Gee whiz!" was all I could think of to say.

"I agree in general with your sentiments, Bill," Dad answered. "Molly, hadn't we better get Peggy inside? I'm afraid she is getting cold."

"Yes," agreed Molly. "I know I am, for one."

"I'm going down to the lake now," I said. The biggest tide of record was expected, of course. While the lake was too small to show much tide, I had made a mark the day before and I hoped to be able to measure it.

"Don't get lost in the dark," Dad called out. I didn't answer him. A silly remark doesn't require an answer.

I had gotten past the road and maybe a quarter of a mile beyond when it hit.

It knocked me flat on my face, the heaviest shake I had ever felt in my life. I've felt heavy quakes in California; they weren't a patch on this one. I lay face down for a long moment, digging into the rock with my finger nails and trying to get it to hold still.

The seasick roll kept up and kept up and kept up, and with it the noise—a deep bass rumble, deeper than thunder and more terrifying.

A rock rolled up against me and nipped my side. I got to my feet and managed to stay there. The ground was still swaying and the rumble kept on. I headed for the house, running—like dancing over shifting ice. I fell down twice and got up again.

The front end of the house was all caved in. The roof slanted down at a crazy angle. "George!" I yelled. "Molly! Where are you?"

George heard me and straightened up. He was on the other side of the house and now I saw him over the collapsed roof. He didn't say anything. I rushed around to where he stood. "Are you all right?" I demanded.

"Help me get Molly out—" he gasped.

I found out later that George had gone inside with Molly and Peggy, had helped get Peg out of the stretcher and back into her room, and then had gone outside, leaving Molly to get breakfast. The quake had hit while he was returning from the barn. But we didn't have time then to talk it over; we dug—moving slabs with our bare hands that had taken four Scouts, working together, to lay. George kept crying, "Molly! Molly! Where are you?"

She was lying on the floor beside the stone work bench that was penned in by the roof. We heaved it off her; George scrambled over the rubble and reached her. "Molly! Molly darling!"

She opened her eyes. "George!"

"Are you all right?"

"What happened?"

"Quake. Are you all right? Are you hurt?"

She sat up, made a face as if something hurt her, and said, "I think I— George! Where s Peggy? Get Peggy!"

Peggy's room was still upright; the reinforcements had held while the rest of the house had gone down around it. George insisted on moving Molly out into the open first, then we tackled the slabs that kept us from getting at the air lock to Peggy's room.

The outer door of the air lock was burst out of its gaskets and stood open, the wrong way. It was black inside the lock; Jupiter light didn't reach inside. I couldn't see what I was doing but when I pushed on the inner door it wouldn't give. "Can't budge it," I told Dad. "Get a light."

"Probably still held by air pressure. Call out to Peggy to get in the stretcher and we'll bleed it."

"I need a light," I repeated.

"I haven't got a light."

"Didn't you have one with you?" I had had one; we always carried torches, outdoors in dark phase, but I had dropped mine when the quake hit. I didn't know where it was.

Dad thought about it, then climbed over the slabs. He was back in a moment. "I found it between here and the barn. I must have dropped it." He shined it on the inner door and we looked over the situation.

"It looks bad," Dad said softly. "Explosive decompression." There was a gap you could poke your fingers through between the top of the door and the frame; the door wasn't pressure held, it was jammed.

Dad called out, "Peggy! Oh, Peggy, darling—can you hear me?"

No answer. "Take the light, Bill—and stand aside." He reared back and then hit the door hard with his shoulder. It gave a bit but didn't open. He hit it again and it flew open, spilling him on his hands and knees. He scrambled up as I shined the light in past him.

Peggy lay half in and half out of bed, as if she had been trying to get up when she passed out. Her head hung down and a trickle of blood was dripping from her mouth on to the floor.

Molly had come in right behind us; she and Dad got Peggy into the stretcher and Dad brought the pressure up. She was alive; she gasped and choked and sprayed blood over us while we were trying to help her. Then she cried. She seemed to quiet down and go to sleep —or maybe fainted again—after we got her into the bubble.

Molly was crying but not making any fuss about it. Dad straightened up, wiped his face and said, "Grab on, Bill. We've got to get her into town."

I said, "Yes," and picked up one end. With Molly holding the light and us carrying, we picked our way over the heap of rock that used to be our house and got out into the open. We put the stretcher down for a moment and I looked around.

I glanced up at Jupiter; the shadows were still on his face and Io and Europa had not yet reached the western edge. The whole thing had taken less than an hour. But that wasn't what held my attention; the sky looked funny.

The stars were too bright and there were too many of them. "George," I said, "what's happened to the sky?"

"No time now——" he started to say. Then he stopped and said very slowly, "Great Scott!"

"What?" asked Molly. "What's the matter?"

"Back to the house, all of you! We've got to dig out all the clothes we can get at. And blankets!"

"What? Why?"

"The heat trap! The heat trap is gone—the quake must have gotten the power house."

So we dug again, until we found what we had to have. It didn't take long; we knew where things had to be. It was just a case of getting the rocks off. The blankets were for the stretcher; Dad wrapped them around like a cocoon and tied them in place. "Okay, Bill," he said. "Quick march, nowl"

It was then that I heard Mabel bawl. I stopped and looked at Dad. He stopped too, with an agony of indecision on his face. "Oh, damn!" he said, the first time I had ever heard him really swear. "We can't just leave her to freeze; she's a member of the family. Come, Bill."

We put the stretcher down again and ran to the bam. It was a junk heap but we could tell by Mabel's complaints where she was. We dragged the roof off her and she got to her feet. She didn't seem to be hurt but I guess she had been knocked silly. She looked at us indignantly.

We had a time of it getting her over the slabs, with Dad pulling and me pushing. Dad handed the halter to Molly. "How about the chickens?" I asked, "And the rabbits?" Some of them had been crushed; the rest were loose around the place. I felt one—a rabbit —scurry between my feet

"No time!" snapped Dad. "We can't take them; all we could do for them would be to cut their throats. Come!"

We headed for the road.

Molly led the way, leading and dragging Mabel and carrying the light. We needed the light. The night, too bright and too clear a few minutes before, was now suddenly overcast. Shortly we couldn't see Jupiter at all, and then you couldn't count your fingers in front of your face.

The road was wet underfoot, not rain, but sudden dew; it was getting steadily colder.

Then it did rain, steadily and coldly. Presently it changed to wet snow. Molly dropped back. "George," she wanted to know, "have we come as far as the turn off to the Schultz's?"

"That's no good," he answered. "We've got to get the baby into the hospital."

That isn't what I meant. Oughtn't I to warn them?"

They'll be all right. Their house is sound."

"But the cold?"

"Oh." He saw what she meant and so did I, when I thought about it. With the heat trap gone and the power house gone, every house in the colony was going to be like an ice box. What good is a power receiver on your roof with no power to receive? It was going to get colder and colder and colder ....

And then it would get colder again. And colder....

"Keep moving," Dad said suddenly. "We'll figure it out when we get there."

But we didn't figure it out, because we never found the turn off.

The snow was driving into our faces by then and we must have walked on past it. It was a dry snow now, little sharp needles that burned when they hit.

Without saying anything about it, I had started counting paces when we left the walls of lava that marked the place where the new road led to our place and out to the new farms beyond. As near as I could make it we had come about five miles when Molly stopped.

"What's the matter?" yelled Dad.

"Dear," she said, "I can't find the road. I think I've lost it."

I kicked the snow away underfoot. It was made ground, all right—soft. Dad took the torch and looked at his watch. "We must have come about six miles," he announced.

"Five," I corrected him. "Or five and a half at the outside," I told him I had been counting.

He considered it. "We've come just about to that stretch where the road is flush with the field," he said. "It can't be more than a half mile or a mile to the cut through Kneiper's Ridge. After that we can't lose it. Bill, take the light and cast off to the right for a hundred paces, then back to the left. If that doesn't do it, well go further. And for heaven's sakes retrace your steps—it's the only way you'll find us in this storm."

I took the light and set out. To the right was no good, though I went a hundred and fifty paces instead of a hundred, I got back to them, and reported, and started out again. Dad just grunted; he was busy with something about the stretcher.

On the twenty-third step to the left I found the road —by stepping down about a foot, falling flat on my face, and nearly losing the light. I picked myself up and went back.

"Good!" said Dad. "Slip your neck through this."

"This" was a sort of yoke he had devised by retying the blankets around the stretcher so as to get some free line. With my neck through it I could carry the weight on my shoulders and just steady my end with my hands. Not that it was heavy, but our hands were getting stiff with cold. "Good enough!" I said, "But, look, George—let Molly take your end."

"Nonsense!"

"It isn't nonsense. Molly can do it—can't you, Molly? And you know this road better than we do; you've tramped it enough times in the dark."

"Bill is right, dear," Molly said at once. "Here—take Mabel."

Dad gave in, took the light and the halter. Mabel didn't want to go any further; she wanted to sit down, I guess. Dad kicked her in the rear and jerked on her neck. Her feelings were hurt; she wasn't used to that sort of treatment—particularly not from Dad. But there was no time to humor her; it was getting colder.

We went on. I don't know how Dad kept to the road but he did. We had been at it another hour, I suppose, and had left Kneiper's slot well behind, when Molly stumbled, then her knees just seemed to cave in and she knelt down in the snow.

I stopped and sat down, too; I needed the rest. I just wanted to stay there and let it snow.

Dad came back and put his arms around her and comforted her and told her to lead Mabel now; she couldn't get lost on this stretch. She insisted that she could still carry. Dad ignored her, just lifted the yoke business off her shoulders. Then he came back and peeled a bit of blanket off the bubble and shined the torch inside. He put it back into place. Molly said, "How is she?'

Dad said, "She's still breathing. She opened her eyes when the light hit them. Let's go." He got the yoke on and Molly took the light and the halter.

Molly couldn't have seen what I saw; the plastic of the bubble was frosted over on the inside. Dad hadn't seen Peggy breathe; he hadn't seen anything.

I thought about it for a long while and wondered how you would classify that sort of a lie. Dad wasn't a liar, that was certain—and yet it seemed to me that such a lie, right then, was better than the truth. It was complicated.

Pretty soon I forgot it; I was too busy putting one foot in front of the other and counting the steps. I couldn't feel my feet any longer.

Dad stopped and I bumped into the end of the stretcher. "Listen!" he said.

I listened and heard a dull rumble. "Quake?"

"No. Keep quiet." Then he added, "It's down the road. Off the road, everybody! Off to the right."

The rumble got louder and presently I made out a light through the snow, back the way we had come. Dad saw it, too, and stepped out on the road and started waving our torch.

The rumble stopped almost on top of him; it was a rock crusher and it was loaded down with people, people clinging to it all over and even riding the spade. The driver yelled, "Climb on! And hurry!"

Then he saw the cow and added, "No live stock."

"We've got a stretcher with my little girl in it," Dad shouted back to him. "We need help."

There was a short commotion, while the driver ordered a couple of men down to help us. In the mix up Dad disappeared. One moment Molly was holding Mabel's halter, then Dad was gone and so was the cow.

We got the stretcher up onto the spade and some of the men braced it with their backs. I was wondering what to do about Dad and thinking maybe I ought to jump off and look for him, when he appeared out of the darkness and scrambled up beside me. "Where's Molly?" he asked.

"Up on top. But where is Mabel? What did you do with her?"

"Mabel is all right." He folded his knife and put it in his pocket. I didn't ask any more questions.

17. Disaster

We passed several more people after that, but the driver wouldn't stop. We were fairly close into town and he insisted that they could make it on their own. His emergency power pack was running low, he said; he had come all the way from the bend in the lake, ten miles beyond our place.

Besides, I don't know where he would have put them. We were about three deep and Dad had to keep warning people not to lean on the bubble of the stretcher.

Then the power pack did quit and the driver shouted, "Everybody off! Get on in on your own." But by now we were actually in town, the outskirts, and it would have been no trouble if it hadn't been blowing a blizzard. The driver insisted on helping Dad with the stretcher. He was a good Joe and turned out to be—when I saw him in the light—the same man who had crushed our acreage.

At long, long last we were inside the hospital and Peggy was turned over to the hospital people and put in a pressurized room. More than that, she was alive. In bad shape, but alive.

Molly stayed with her. I would like to have stayed, too—it was fairly warm in the hospital; it had its own emergency power pack. But they wouldn't let me.

Dad told Molly that he was reporting to the chief engineer for duty. I was told to go to the Immigration Receiving Station. I did so and it was just like the day we landed, only worse—and colder. I found myself right back in the very room which was the first I had ever been in on Ganymede.

The place was packed and getting more packed every minute as more refugees kept pouring in from the surrounding country. It was cold, though not so bitterly cold as outside. The lights were off, of course; light and heat all came from the power plant for everything. Hand lights had been set up here and there and you could sort of grope your way around. There were the usual complaints, too, though maybe not as bad as you hear from immigrants. I paid no attention to any of them; I was happy in a dead beat sort of way just to be inside and fairly warm and feel the blood start to go back into my feet.

We stayed there for thirty-seven hours. It was twenty-four hours before we got anything to eat.

Here was the way it went: the metal buildings, such as the Receiving Station, stood up. Very few of the stone buildings had, which we knew by then from the reports of all of us. The Power Station was out, and with it, the heat trap. They wouldn't tell us anything about it except to say that it was being fixed.

In the mean time we were packed in tight as they could put us, keeping the place warm mainly by the heat from our bodies, sheep style. There were, they say, several power packs being used to heat the place, too, one being turned on every time the temperature in the room dropped below freezing. If so, I never got close to one and I don't think it ever did get up to freezing where I was.

I would sit down and grab my knees and fall into a dopey sleep. Then a nightmare would wake me up and I'd get up and pound myself and walk around. After a while I'd sit down on the floor and freeze my fanny again.

I seem to remember encountering Noisy Edwards in the crowd and waving my finger under his nose and telling him I had an appointment to knock his block off. I seem to remember him staring back at me as if he couldn't place me. But I don't know; I may have dreamed it. I thought I ran across Hank, too, and had a long talk with him, but Hank told me afterwards that he never laid eyes on me the whole time.

After a long time—it seemed a week but the records show it was eight o'clock Sunday morning—they passed us out some lukewarm soup. It was wonderful. After that I wanted to leave the building to go to the hospital. I wanted to find Molly and see how Peggy was doing.

They wouldn't let me. It was seventy below outside and still dropping.

About twentytwo o'clock the lights came on and the worst was over.

We had a decent meal soon after that, sandwiches and soup, and when the Sun came up at midnight they announced that anybody could go outside who cared to risk it. I waited until noon Monday. By then it was up to twenty below and I made a dash for it to the hospital.

Peggy was doing as well as could be expected. Molly had stayed with her and had spent the time in bed with her, huddling up to her to keep her warm. While the hospital had emergency heat, it didn't have the capacity to cope with any such disaster as had struck us; it was darn near as cold as the Receiving Station. But Peggy had come through it, sleeping most of the time. She even perked up enough to smile and say hello.

Molly's left arm was in a sling and splinted. I asked how that happened—and then I felt foolish. It had happened in the quake itself but I hadn't known it and George still didn t know about it; none of the engineers were back.

It didn't seem possible that she could have done what she did, until I recalled that she carried the stretcher only after Dad had rigged the rope yokes. Molly is all right.

They chased me out and I hightailed it back to the Receiving Station and ran into Sergei almost at once. He hailed me and I went over to him. He had a pencil and a list and a number of the older fellows were gathered around him. "What's up?" I said.

"Just the guy I'm looking for," he said. "I had you down for dead. Disaster party—are you in?"

I was in, all right. The parties were made up of older Scouts, sixteen and up, and the younger men, We were sent out on the town's tractors, one to each road, and we worked in teams of two. I spotted Hank Jones as we were loading and they let us make up a team.

It was grim work. For equipment we had shovels and lists—lists of who lived on which farm. Sometimes a name would have a notation "known to be alive," but more often not. A team would be dropped off with the lists for three or four farms and the tractor would go on, to pick them up on the return trip.

Our job was to settle the doubt about those other names and—theoretically—to rescue anyone still alive.

We didn't find anyone alive.

The lucky ones had been killed in the quake; the unlucky ones had waited too long and didn't make it into town. Some we found on the road; they had tried to make it but had started too late. The worst of all were those whose houses hadn't fallen and had tried to stick it out. Hank and I found one couple just sitting, arms around each other. They were hard as rock.

When we found one, we would try to identify it on the list, then cover it up with snow, several feet deep, so it would keep for a while after it started to thaw.

When we settled with the people at a farm, we rummaged around and found all the livestock we could and carried or dragged their carcasses down to the road, to be toted into town on the tractor and slapped into deep freeze. It seemed a dirty job to do, robbing the dead, but, as Hank pointed out, we would all be getting a little hungry by and by.

Hank bothered me a little; he was merry about the whole thing. I guess it was better to laugh about it, in the long run, and after a while he had me doing it. It was just too big to soak up all at once and you didn't dare let it get you.

But I should have caught on when we came to his own place. "We can skip it," he said, and checked off the list.

"Hadn't we better check for livestock?" I said.

"Nope. We're running short of time. Let's move on to the Millers' place."

"Did they get out?"

"I don't know. I didn't see any of them in town."

The Millers hadn't gotten out; we barely had time to take care of them before the tractor picked us up. It was a week later that I found out that both of Hank's parents had been killed in the quake. He had taken time to drag them out and put them into their ice cellar before he had headed for town.

Like myself, Hank had been outside when it hit, still looking at the line up. The fact that the big shock had occurred right after the line up had kept a lot of people from being killed in their beds—but they say that the line up caused the quake, triggered it, that is, with tidal strains, so I guess it sort of evens up. Of course, the line up didn't actually make the quake; it had been building up to it ever since the beginning of the atmosphere project. Gravity's books have got to balance.

The colony had had thirty-seven thousand people when the quake hit. The census when we finished it showed less than thirteen thousand. Besides that we had lost every crop, all or almost all the livestock. As Hank said, we'd all be a little hungry by and by.

They dumped us back at the Receiving Station and a second group of parties got ready to leave. I looked for a quiet spot to try to get some sleep.

I was just dozing off, it seemed to me, when somebody shook me. It was Dad. "Are you all right, Bill?"

I rubbed my eyes. "I'm okay. Have you seen Molly and Peggy?"

"Just left them. I'm off duty for a few hours. Bill, have you seen anything of the Schultzes?"

I sat up, wide awake. "No. Have you?"

"No."

I told him what I had been doing and he nodded. "Go back to sleep, Bill. I'll see if there has been a report on them."

I didn't go to sleep. He was back after a bit to say that he hadn't been able to find out anything one way or another. "I'm worried, Bill."

"So am I."

"I'm going out and check up."

"Let's go."

Dad shook his head. "No need for us both. You get some sleep." I went along, just the same.

We were lucky. A disaster party was just heading down our road and we hitched a ride. Our own farm and the Schultz's place were among those to be covered on this trip; Dad told the driver that we would check both places and report when we got back to town. That was all right with him.

They dropped us at the turn off and we trudged up toward the Schultz's house. I began to get the horrors as we went. It's one thing to pile snow over comparative strangers; it's another thing entirely to expect to find Mama Schultz or Gretchen with their faces blue and stiff.

I didn't visualize Papa as dead; people like Papa Schultz don't die–they just go on forever. Or it feels like that.

But I still wasn't prepared for what we did find.

We had just come around a little hummock that conceals their house from the road. George stopped and said, "Well, the house is still standing. His quakeproofing held."

I looked at it, then I stared—and then I yelled. "Hey, George! The Tree is gone!"

The house was there, but the apple tree—"the most beautiful tree on Ganymede"—was missing. Just gone. I began to run.

We were almost to the house when the door opened. There stood Papa Schultz.

They were all safe, every one of them. What remained of the tree was ashes in the fireplace. Papa had cut it down as soon as the power went off and the temperature started to drop—and then had fed it, little by little, into the flames.

Papa, telling us about it, gestured at the blackened firebox. "Johann's folly, they called it. I guess they will not think old Appleseed Johnny quite so foolish now, eh?" He roared and slapped Dad on the shoulders.

"But your tree," I said stupidly.

"I will plant another, many others." He stopped and was suddenly serious. "But your trees, William, your brave little baby trees—they are dead, not?"

I said I hadn't seen them yet. He nodded solemnly. "They are dead of the cold. Hugo!"

"Yes, Papa."

"Fetch me an apple." Hugo did so and Papa presented it to me. "You will plant again." I nodded and stuck it in my pocket.

They were glad to hear that we were all right, though Mama clucked over Molly's broken arm. Yo had fought his way over to our place during the first part of the storm, found that we were gone and returned, two frost bitten ears for his efforts. He was in town now to look for us.

But they were all right, every one of them. Even their livestock they had saved—cows, pigs, chickens, people, all huddled together throughout the cold and kept from freezing by the fire from their tree.

The animals were back in the barn, now that power was on again, but the place still showed that they had been there—and smelled of it, too. I think Mama was more upset by the shambles of her immaculate living room than she was by the magnitude of the disaster. I don't think she realized that most of her neighbors were dead. It hadn't hit her yet.

Dad turned down Papa Schultz's offer to come with us to look over our farm. Then Papa said he would see us on the tractor truck, as he intended to go into town and find out what he could do. We had mugs of Mama's strong tea and some corn bread and left.

I was thinking about the Schultzes and how good it was to find them alive, as we trudged over to our place. I told Dad that it was a miracle.

He shook his head. "Not a miracle. They are survivor types."

"What type is a survivor type?" I asked.

He took a long time to answer that one. Finally he said, "Survivors survive. I guess that is the only way to tell the survivor type for certain."

I said. "We're survivor types, too, in that case."

"Could be," he admitted. "At least we've come through this one."

When I had left, the house was down. In the mean time I had seen dozens of houses down, yet it was a shock to me when we topped the rise and I saw that it really was down. I suppose I expected that after a while I would wake up safe and warm in bed and everything would be all right.

The fields were there, that was all that you could say for it. I scraped the snow off a stretch I knew was beginning to crop. The plants were dead of course and the ground was hard. I was fairly sure that even the earth worms were dead; they had had nothing to warn them to burrow below the frost line.

My little saplings were dead, of course.

We found two of the rabbits, huddled together and stiff, under a drift against what was left of the barn. We didn't find any of the chickens except one, the first old hen we ever had. She had been setting and her nest wasn't crushed and had been covered by a piece of the fallen roof of the barn. She was still on it, hadn't moved and the eggs under her were frozen. I think that was what got me.

I was just a chap who used to have a farm.

Dad had been poking around the house. He came back to the barn and spoke to me. "Well, Bill?"

I stood up. "George, I've had it."

"Then let's go back to town. The truck will be along shortly."

"I mean I've really had it!"

"Yes, I know."

I took a look in Peggy's room first, but Dad's salvage had been thorough. My accordion was in there, however, with snow from the broken door drifted over the case. I brushed it off and picked it up. "Leave it," Dad said. "It's safe here and you've no place to put it."

"I don't expect to be back," I said.

"Very well."

We made a bundle of what Dad had gotten together, added the accordion, the two rabbits and the hen, and carried it all down to the road. The tractor showed up presently, we got aboard and Dad chucked the rabbits and chicken on the pile of such that they had salvaged. Papa Schultz was waiting at his turnoff.

Dad and I tried to spot Mabel by the road on the trip back, but we didn't find her. Probably she had been picked up by an earlier trip, seeing that she was close to town. I was just as well pleased. All right, she had to be salvaged—but I didn't want the job. I'm not a cannibal.

I managed to get some sleep and a bite to eat and was sent out on another disaster party. The colony began to settle down into some sort of routine. Those whose houses had stood up moved back into them and the rest of us were taken care of in the Receiving Station, much as we had been when our party landed. Food was short, of course, and Ganymede had rationing for the first time since the first colonials really got started.

Not that we were going to starve. In the first place there weren't too many of us to feed and there had been quite a lot of food on hand. The real pinch would come later. It was decided to set winter back by three months, that is, start all over again with spring—which messed up the calendar from then on. But it would give us a new crop as quickly as possible to make up for the one that we had lost.

Dad stayed on duty with the engineer's office. Plans called for setting up two more power plants, spaced around the equator, and each of them capable of holding the heat trap alone. The disaster wasn't going to be allowed to happen again. Of course the installations would have to come from Earth, but we had been lucky on one score; Mars was in a position to relay for us. The report had gone into Earth at once and, instead of another load of immigrants, we were to get what we needed on the next trip.

Not that I cared. I had stayed in town, too, although the Schultzes had invited me to stay with them. I was earning my keep helping to rebuild and quakeproof the houses of the survivors. It had been agreed that we would all go back, George, Molly, Peggy, and me, on the first trip, if we could get space. It had been unanimous except that Peggy hadn't been consulted; it just had to be.

We weren't the only ones who were going back. The Colonial Commission had put up a squawk of course, but under the circumstances they had to give in. After it had been made official and the lists were opened Dad and I went over to the Commission agent's office to put in our applications. We were about the last to apply; Dad had been out of town on duty and I had waited until he got back.

The office was closed with a "Back in a half hour" sign stuck on the door. We waited. There were bulletin boards outside the office; on them were posted the names of those who had applied for repatriation. I started reading them to kill time and so did Dad.

I found Saunders' name there and pointed it out to George. He grunted and said, "No loss." Noisy Edwards' name was there, too; maybe I had seen him in the Receiving Station, although I hadn't seen him since. It occurred to me that I could probably corner him in the ship and pay him back his lumps, but I wasn't really interested in the project. I read on down.

I expected to find Hank Jones' name there, but I couldn't find it. I started reading the list carefully, paying attention to every name I recognized. I began to see a pattern.

Presently the agent got back and opened the door. Dad touched my arm. "Come on, Bill."

I said, "Wait a minute, George. You read all the names?"

"Yes, I did."

"I've been thinking. You know, George, I don't like being classed with these lugs."

He chewed his lip. "I know exactly what you mean."

I took the plunge. "You can do as you like, George, but I'm not going home, if I ever do, until I've licked this joint."

Dad looked as unhappy as he could look. He was silent for a long time, then he said, "I've got to take Peggy back, Bill. She won't go unless Molly and I go along. And she's got to go."

"Yes, I know."

"You understand how it is, Bill?"

"Yes, Dad, I understand." He went on in to make out his application, whistling a little tune he used to whistle just after Anne died. I don't think he knew he was whistling it.

I waited for him and after a bit we went away together.

I moved back out to the farm the next day. Not to the Schultzes—to the farm. I slept in Peggy's room and got busy fixing the place up and getting ready to plant my emergency allowance of seed.

Then, about two weeks before they were to leave in the Covered Wagon, Peggy died, and there wasn't any reason for any of us to go back to Earth.

Yo Schultz had been in town and Dad sent word back by him. Yo came over and woke me up and told me about it. I thanked him.

He wanted to know if I wanted to come back to the house with him. I said, no, thanks, that I would rather be alone. He made me promise to come over the next day and went away.

I lay back down on Peggy's bed.

She was dead and there was nothing more I could do about it She was dead and it was all my fault… if I hadn't encouraged her, they would have been able to get her to go back before it was too late. She would be back Earthside, going to school and growing up healthy and happy—right back in California, not here in this damned place where she couldn't live, where human beings were never meant to live.

I bit the pillow and blubbered. I said, "Oh, Anne, Anne! Take care of her, Anne—She's so little; she won't know what to do."

And then I stopped bawling and listened, half way expecting Anne to answer me and tell me she would,

But I couldn't hear anything, not at first… and what I did hear was only, "Stand tall, Billy," . .. very faint and far away, "Stand tall, son."

After a while I got up and washed my face and started hoofing it back into town.

18. Pioneer Party

We all lived in Peggy's room until Dad and I had the seeds in, then we built on to it, quake proof this time and with a big view window facing the lake and another facing the mountains. We knocked a window in Peggy's room, too; it made it seem like a different place.

We built on still another room presently, as it seemed as if we might be needing it. All the rooms had windows and the living room had a fireplace.

Dad and I were terribly busy the second season after the quake. Enough seed could be had by then and we farmed the empty farm across the road from us. Then some newcomers, the Ellises, moved in and paid us for the crop. It was just what they call a "book transaction," but it reduced our debt with the Commission.

Two G-years after the line up you would never have known that anything had happened. There wasn't a wrecked building in the community, there were better than fortyfive thousand people, and the town was booming. New people were coming in so fast that you could even sell some produce to the Commission in lieu of land.

We weren't doing so badly, ourselves. We had a hive of bees. We had Mabel II, and Margie and Mamie, and I was sending the spare milk into town by the city transport truck that passed down our road once a day. I had broken Marge and Mamie to the yoke and used them for ploughing as well—we had crushed five more acres—and we were even talking about getting a horse.

Some people had horses already, the Schultzes for instance. The council had wrangled about it before okaying the "invasion," with conservatives holding out for tractors. But we weren't equipped to manufacture tractors yet and the policy was to make the planet self-sufficient—the hay burners won out. Horses can manufacture more horses and that is one trick that tractors have never learned.

Furthermore, though I would have turned my nose up at the idea when I was a ground hog back in Diego Borough, horse steak is very tasty.

It turned out we did need the extra room. Twins— both boys. New babies don't look as if they were worth keeping, but they get over it—slowly. I bought a crib as a present for them, made right here on Ganymede, out of glass fabric stuck together with synthetic resin. It was getting possible to buy quite a number of home products.

I told Molly I would initiate the brats into the Cubs when they were old enough. I was getting in to meetings oftener now, for I had a patrol again—the Daniel Boone patrol, mostly new kids. I still hadn't taken my own tests but you can't do everything at once. Once I was scheduled to take them and a litter of pigs picked that day to arrive. But I planned to take them; I wanted to be an Eagle Scout again, even if I was getting a little old to worry about badges in themselves.

It may sound as if the survivors didn't give a hoot about those who had died in the disaster. But that isn't the truth. It was just that you work from day to day and that keeps your mind busy. In any case, we weren't the first colony to be two-thirds wiped out— and we wouldn't be the last. You can grieve only so much; after that it's self pity. So George says.

George still wanted me to go back to Earth to finish my education and I had been toying with the idea myself. I was beginning to realize that there were a few things I hadn't learned. The idea was attractive; it would not be like going back right after the quake, tail between my legs. I'd be a property owner, paying my own way. The fare was considerable—five acres—and would about clean me out, my half, and put a load on George and Molly. But they were both for it.

Besides, Dad owned blocked assets back Earthside which would pay my way through school. They were no use to him otherwise; the only thing the Commission will accept as pay for imports is proved land. There was even a possibility, if the council won a suit pending back Earthside, that his blocked assets could be used for my fare as well and not cost us a square foot of improved soil. All in all, it was nothing to turn down idly.

We were talking about me leaving on the New Ark when another matter came up—the planetary survey.

Ganymede had to have settlements other than Leda; that was evident even when we landed. The Commission planned to set up two more ports-of-entry near the two new power stations and let the place grow from three centers. The present colonists were to build the new towns—receiving stations, hydroponics sheds, infirmaries, and so forth—and be paid for it in imports. Immigration would be stepped up accordingly, something that the Commission was very anxious to do, now that they had the ships to dump them in on us in quantity.

The old Jitterbug was about to take pioneer parties out to select sites and make plans—and both Hank and Sergei were going.

I wanted to go so bad I could taste it In the whole time I had been here I had never gotten fifty miles from Leda. Suppose somebody asked me what it was like on Ganymede when I got back on Earth? Truthfully, I wouldn't be able to tell them; I hadn't been any place.

I had had a chance, once, to make a trip to Barnard's Moon, as a temporary employee of Project Jove—and that hadn't worked out either. The twins. I stayed back and took care of the farm.

I talked it over with Dad.

"I hate to see you delay it any longer," he said seriously. I pointed out that it would be only two months.

"Hmmm—" he said. "Have you taken your merit badge tests yet?"

He knew I hadn't; I changed the subject by pointing out that Sergei and Hank were going.

"But they are both older than you are," he answered.

"Not by very much!"

"But I think they are each over the age limit they were looking for—and you are just under."

"Look, George," I protested, "rules were made to be broken. I've heard you say that There must be some spot I can fill—cook, maybe."

And that's just the job I got—cook.

I always have been a pretty fair cook—not in Mama Schultz's class, but good. The party had nothing to complain about on that score.

Captain Hattie put us down at a selected spot nine degrees north of the equator and longitude 113 west—that is to say, just out of sight of Jupiter on the far side and about thirtyone hundred miles from Leda. Mr. Hooker says that the average temperature of Ganymede will rise about nine degrees over the next century as more and more of the ancient ice melts—at which time Leda will be semitropical and the planet will be habitable half way to the poles. In the meantime colonies would be planted only at or near the equator.

I was sorry we had Captain Hattie as pilot; she is such an insufferable old scold. She thinks rocket pilots are a special race apart

—supermen. At least she acts like it. Recently the Commission had forced her to take a relief pilot; there was just too much for one pilot to do. They had tried to force a check pilot on her, too—an indirect way to lead up to retiring her, but she was too tough for them. She threatened to take the Jitterbug up and crash it ... and they didn't dare call her bluff. At that time they were absolutely dependent on the Jitterbug.

Originally the Jitterbug's only purpose was for supply and passengers between Leda and the Project Jove station on Barnard's Moon—but that was back in the days when ships from Earth actually landed at Leda. Then the *Mayflower* came along and the Jitterbug was pressed into service as a shuttle. There was talk of another shuttle rocket but we didn't have it yet, which is why Captain Hattie had them where it hurt. The Commission had visions of a loaded ship circling Ganymede, just going round and round and round again, with no way to get down, like a kitten stuck up in a tree.

I'll say this for Hattie; she could handle her ship. I think she had nerve ends out in the skin of it. In clear weather she could even make a glide landing, in spite of our thin air. But I think she preferred to shake up her passengers with a jet landing.

She put us down, the Jitterbug took on more water mass, and away it bounced. She had three more parties to land. All in all the Jitterbug was servicing eight other pioneer parties. It would be back to pick us up in about three weeks.

The leader of our party was Paul du Maurier, who was the new assistant Scoutmaster of the Auslander troop and the chap who had gotten me taken on as cookie. He was younger than some of those working for him; furthermore, he shaved, which made him stand out like a white leghorn in a hog pen and made him look even younger. That is, he did shave, but he started letting his beard grow on this trip. "Better trim that grass," I advised him.

He said, "Don't you like my beard, Doctor Slop?" —that was a nickname he had awarded me for "Omnibus stew," my own invention. He didn't mean any harm by it.

I said, "Well, it covers your face, which is some help—but you might be mistaken for one of us colonial roughnecks. That wouldn't do for one of you high-toned Commission boys."

He smiled mysteriously and said, "Maybe that's what I want."

I said, "Maybe. But they'll lock you up in a zoo if you wear it back to Earth." He was due to go back for Earthside duty by the same trip I expected to make, via the Covered Wagon, two weeks after the end of the survey.

He smiled again and said, "Ah, yes, so they would," and changed the subject. Paul was one of the most thoroughly good guys I have ever met and smart as a whip as well. He was a graduate of South Africa University with P. G. on top of that at the System Institute on Venus—an ecologist, specializing in planetary engineering.

He handled that gang of rugged individualists without raising his voice. There is something about a real leader that makes it unnecessary for him to get tough.

But back to the survey—I didn't see much of it as I was up to my elbows in pots and pans, but I knew what was going on. The valley we were in had been picked from photographs taken from the Jitterbug; it was now up to Paul to decide whether or not it was ideally suited to easy colonization. It had the advantage of being in direct line-of-sight with power station number two, but that was not essential. Line-of-sight power relays could be placed anywhere on the mountains (no name, as yet) just south of us. Most of the new villages would have to have power relayed anyhow. Aside from a safety factor for the heat trap there was no point in setting up extra power stations when the whole planet couldn't use the potential of one mass-conversion plant.

So they got busy—an engineering team working on drainage and probable annual water resources, topographers getting a contour, a chemistry-agronomy team checking on what the various rock formations would make as soil, and a community architect laying out a town and farm and rocket port plot. There were several other specialists, too, like the mineralogist, Mr. Villa, who was doodlebugging the place for ores.

Paul was the "general specialist" who balanced all the data in his mind, fiddled with his slip stick, stared off into the sky, and came up with the over all answer. The over all answer for that valley was "nix"—and we moved on to the next one on the list, packing the stuff on our backs.

That was one of the few chances I got to look around. You see, we had landed at sunrise—about five o'clock Wednesday morning sunrise was, in that longitude—and the object was to get as much done as possible during each light phase. Jupiter light is all right for working in your own fields, but no good for surveying strange territory—and here we didn't even have Jupiter light—just Callisto, every other dark phase, every twelve-and-half days, to be exact. Consequently we worked straight through light phase, on pep pills.

Now a man who is on the pills will eat more than twice as much as a man who is sleeping regularly. You know, the Eskimos have a saying, "Food is sleep." I had to produce hot meals every four hours, around the clock. I had no time for sightseeing.

We got to camp number two, pitched our tents, I served a scratch meal, and Paul passed out sleeping pills. By then the Sun was down and we really died for about twenty hours. We were comfortable enough —spun glass pads under us and resin sealed glass canvas over us.

I fed them again, Paul passed out more sleepy pills, and back we went to sleep. Paul woke me Monday afternoon. This time I fixed them a light breakfast, then really spread myself to turn them out a feast. Everybody was well rested by now, and not disposed to want to go right back to bed. So I stuffed them.

After that we sat around for a few hours and talked. I got out my squeeze box—brought along by popular demand, that is to say, Paul suggested it—and gave 'em a few tunes. Then we talked some more.

They got to arguing about where life started and somebody brought up the old theory that the Sun had once been much brighter —Jock Montague, it was, the chemist. "Mark my words," he said, "When we get around to exploring Pluto, you'll find that life was there before us. Life is persistent, like mass-energy."

"Nuts," answered Mr. Villa, very politely. "Pluto isn't even a proper planet; it used to be a satellite of Neptune."

"Well, Neptune, then," Jock persisted. "Life is all through the universe. Mark my words—when the Jove Project straightens out the bugs and gets going, they'll even find life on the surface of Jupiter."

"On Jupiter?" Mr. Villa exploded. "Please, Jock! Methane and ammonia and cold as a motherin-law's kiss. Don't joke with us. Why, there's not even light down under on the surface of Jupiter; it's pitch dark."

"I said it and I'll say it again," Montague answered. "Life is persistent. Wherever there is mass and energy with conditions that permit the formation of large and stable molecules, there you will find life. Look at Mars. Look at Venus. Look at Earth—the most dangerous planet of the lot. Look at the Ruined Planet."

I said, "What do you think about it, Paul?"

The boss smiled gently. "I don't. I haven't enough data."

"There!" said Mr. Villa. "There speaks a wise man. Tell me, Jock, how did you get to be an authority on this subject?"

"I have the advantage," Jock answered grandly, "of not knowing too much about the subject. Facts are always a handicap in philosophical debate."

That ended that phase of it, for Mr. Seymour, the boss agronomist, said, "I'm not so much worried about where life came from as where it is going—here."

"How?" I wanted to know. "In what way?"

"What are we going to make of this planet? We can make it anything we want. Mars and Venus—they had native cultures. We dare not change them much and we'll never populate them very heavily. These Jovian moons are another matter; it's up to us. They say man is endlessly adaptable. I say on the contrary that man doesn't adapt himself as much as he adapts his environment. Certainly we are doing so here. But how?"

"I thought that was pretty well worked out," I said. "We set up these new centers, more people come in and we spread out, same as at Leda."

"Ah, but where does it stop? We have three ships making regular trips now. Shortly there will be a ship in every three weeks, then it will be every week, then every day. Unless we are almighty careful there will be food rationing here, same as on Earth. Bill, do you know how fast the population is increasing, back Earthside?"

I admitted that I didn't

"More than one hundred thousand more persons each day than there were the day before. Figure that up."

I did. "That would be, uh, maybe fifteen, twenty shiploads a day. Still, I imagine they could build ships to carry them."

"Yes, but where would we put them? Each day, more than twice as many people landing as there are now on this whole globe. And not just on Monday, but on Tuesday, and Wednesday, and Thursday—and the week and the month and the year after that, just to keep Earth's population stable. I tell you, it won't work. The day will come when we will have to stop immigration entirely." He looked around aggressively, like a man who expects to be contradicted.

He wasn't disappointed. Somebody said, "Oh, Seymour, come off it! Do you think you own this place just because you got here first? You snuck in while the rules were lax."

"You can't argue with mathematics," Seymour insisted. "Ganymede has got to be made self-sufficient as soon as possible—and then we've got to slam the door!"

Paul was shaking his head. "It won't be necessary."

"Huh?" said Seymour. "Why not? Answer me that. You represent the Commission: what fancy answer has the Commission got?"

"None," Paul told him. "And your figures are right but your conclusions are wrong. Oh, Ganymede has to be made self-sufficient, true enough, but your bogeyman about a dozen or more shiploads of immigrants a day you can forget."

"Why, if I may be so bold?"

Paul looked around the tent and grinned apologetically. "Can you stand a short dissertation on population dynamics? I'm afraid I don't have Jock's advantage; this is a subject I am supposed to know something about."

Somebody said, "Stand back. Give him air."

"Okay," Paul went on, "you brought it on yourselves. A lot of people have had the idea that colonization is carried on with the end purpose of relieving the pressure of people and hunger back on Earth. Nothing could be further from the truth."

I said. "Huh?"

"Bear with me. Not only is it physically impossible for a little planet to absorb the increase of a big planet, as Seymour pointed out, but there is another reason why well never get any such flood of people as a hundred thousand people a day—a psychological reason. There are never as many people willing to emigrate (even if you didn't pick them over) as there are new people born. Most people simply will not leave home. Most of them won't even leave their native villages, much less go to a far planet."

Mr. Villa nodded. "I go along with you on that The willing emigrant is an odd breed of cat. He's scarce."

"Right," Paul agreed. "But let's suppose for a moment that a hundred thousand people were willing to emigrate every day and Ganymede and the other colonies could take them. Would that relieve the situation back home—I mean "back Earthside'? The answer is, 'No, it wouldn't'."

He appeared to have finished. I finally said, "Excuse my blank look, Paul, but why wouldn't it?"

"Studied any bionomics, Bill?"

"Some."

"Mathematical population bionomics?"

"Well–no."

"But you do know that in the greatest wars the Earth ever had there were always more people after the war than before, no matter how many were killed. Life is not merely persistent, as Jock puts it; life is explosive. The basic theorem of population mathematics to which there has never been found an exception is that population increases always, not merely up to extent of the food supply, but beyond it, to the minimum diet that will sustain life—the ragged edge of starvation. In other words, if we bled off a hundred thousand people a day, the Earth's population would then grow until the increase was around two hundred thousand a day, or the bionomical maximum for Earth's new ecological dynamic."

Nobody said anything for a moment; there wasn't anything to say. Presently Sergei spoke up with, "You paint a grim picture, boss. What's the answer?"

Paul said, "There isn't any!"

Sergei said, "I didn't mean it that way. I mean, what is the outcome?"

When Paul did answer it was just one word, one monosyllable, spoken so softly that it would not have been heard if there had not been dead silence. What he said was:

"War."

There was a shuffle and a stir; it was an unthinkable idea. Seymour said, "Come now, Mr. du Maurier—I may be a pessimist, but I'm not that much of one. Wars are no longer possible."

Paul said, "So?"

Seymour answered almost belligerently, "Are you trying to suggest that the Space Patrol would let us down? Because that is the only way a war could happen."

Paul shook his head. "The Patrol won't let us down. But they won't be able to stop it. A police force is all right for stopping individual disturbances; it's fine for nipping things in the bud. But when the disturbances are planet wide, no police force is big enough, or strong enough, or wise enough. They'll try—they'll try bravely. They won't succeed."

"You really believe that?"

"It's my considered opinion. And not only my opinion, but the opinion of the Commission. Oh, I don't mean the political board; I mean the career scientists."

"Then what in tarnation is the Commission up to?"

"Building colonies. We think that is worthwhile in itself. The colonies need not be affected by the War. In fact, I don't think they will be, not much. It will be like America was up to the end of the nineteenth century; European troubles passed her by. I rather expect that the War, when it comes, will be of such size and duration that interplanetary travel will cease to be for a considerable period. That is why I said this planet has got to be self-sufficient. It takes a high technical culture to maintain interplanetary travel and Earth may not have it—after a bit."

I think Paul's ideas were a surprise to everyone present; I know they were to me. Seymour jabbed a finger at him, "If you believe this, then why are you going back to Earth? Tell me that."

Again Paul spoke softly. "I'm not. I'm going to stay here and become a 'steader."

Suddenly I knew why he was letting his beard grow.

Seymour answered, "Then you expect it soon." It was not a question; it was a statement.

"Having gone this far," Paul said hesitantly, "I'll give you a direct answer. War is not less than forty Earth years away, not more than seventy."

You could feel a sigh of relief all around the place. Seymour continued to speak for us, "Forty to seventy, you say. But that's no reason to homestead; you probably wouldn't live to see it. Not but what you'd make a good neighbor."

"I see this War," Paul insisted. "I know it's coming. Should I leave it up to my hypothetical children and grandchildren to outguess it? No. Here I rest. If I marry, I'll marry here. I'm not raising any kids to be radioactive dust."

It must have been about here that Hank stuck his head in the tent, for I don't remember anyone answering Paul. Hank had been outside on business of his own; now he opened the flap and called out, "Hey gents! Europa is up!"

We all trooped out to see. We went partly through embarrassment, I think; Paul had been too nakedly honest. But we probably would have gone anyhow. Sure, we saw Europa every day of our lives at home, but not the way we were seeing it now.

Since Europa goes around Jupiter inside Ganymede's orbit, it never gets very far away from Jupiter, if you call 39 degrees "not very far." Since we were 113 west longitude, Jupiter was 23 degrees below our eastern horizon—which meant that Europa, when it was furthest west of Jupiter, would be a maximum of 16 degrees above the true horizon.

Excuse the arithmetic. Since we had a row of high hills practically sitting on us to the east, what all this means is that, once a week, Europa would rise above the hills, just peeking over, hang there for about a day—then turn around and set in the east, right where it had risen. Up and down like an elevator.

If you've never been off Earth, don't tell me it's impossible. That's how it is—Jupiter and its moons do some funny things.

It was the first time it had happened this trip, so we watched it—a little silver boat, riding the hills like waves, with its horns turned up. There was argument about whether or not it was still rising, or starting to set again, and much comparing of watches. Some claimed to be able to detect motion but they weren't agreed on which way. After a while I got cold and went back in.

But I was glad of the interruption. I had a feeling that Paul had said considerably more than he had intended to and more than he would be happy to recall, come light phase. I blamed it on the sleeping pills. Sleeping pills are all right when necessary, but they tend to make you babble and tell your right name–treacherous things.

19. The Other People

By the end of the second light phase it was clear–to Paul, anyhow—that this second valley would do. It wasn't the perfect valley and maybe there was a better one just over the ridge—but life is too short. Paul assigned it a score of 92% by some complicated system thought up by the Commission, which was seven points higher than passing.

The perfect valley could wait for the colonials to find it ... which they would, some day.

We named the valley Happy Valley, Just for luck, and named the mountains south of it the Pauline Peaks, over Paul's protests. He said it wasn't official anyway; we said we would see to it that it was made so—and the boss topographer, Abie Finkelstein, marked it so on the map and we all intialed it

We spent the third light phase rounding up the details. We could have gone back then, if there had been any way to get back. There wasn't, so we had to dope through another dark phase. Some of them preferred to go back on a more normal schedule instead; there was a round-the-clock poker game, which I stayed out of, having nothing I could afford to lose and no talent for filling straights. There were more dark phase bull sessions but they never got as grave as the first one and nobody ever again asked Paul what he thought about the future prospects of things.

By the end of the third dark phase I was getting more than a little tired of seeing nothing but the inside of our portable range. I asked Paul for some time off.

Hank had been helping me since the start of the third dark phase. He had been working as a topographical assistant; flash contour pictures were on the program at the start of that dark phase. He was supposed to get an open-lens shot across the valley from an elevation on the south just as a sunburst flash was let off from an elevation to the west.

Hank had a camera of his own, just acquired, and he was shutter happy, always pointing it at things. This time he had tried to get a picture of his own as well as the official picture. He had goofed off, missed the official picture entirely, and to top it off had failed to protect his eyes when the sunburst went off. Which put him on the sick list and I got him as kitchen police.

He was all right shortly, but Finkelstein didn't want him back. So I asked for relief for both of us, so we could take a hike together and do a little exploring. Paul let us go.

There had been high excitement at the end of the second light phase when lichen had been discovered near the west end of the valley. For a while it looked as if native life had been found on Ganymede. It was a false alarm—careful examination showed that it was not only an Earth type, but a type authorized by the bionomics board.

But it did show one thing—life was spreading, taking hold, at a point thirtyone hundred miles from the original invasion. There was much argument as to whether the spores had been air borne, or had been brought in on the clothing of the crew who had set up the power plant. It didn't matter, really.

But Hank and I decided to explore off that way and see if we could find more of it. Besides it was away from the way we had come from camp number one. We didn't tell Paul we were going after lichen because we were afraid he would veto it; the stuff had been found quite some distance from camp. He had warned us not to go too far and to be back by six o'clock Thursday morning, in time to break camp and head back to our landing point, where the Jitterbug was to meet us.

I agreed as I didn't mean to go far in any case. I didn't much care whether we found lichen or not; I wasn't feeling well. But I kept that fact to myself; I wasn't going to be done out of my one and only chance to see some of the country.

We didn't find any more lichen. We did find the crystals.

We were trudging along, me as happy as a kid let out of school despite an ache in my side and Hank taking useless photographs of odd rocks and lava flows. Hank had been saying that he thought he would sell out his place and homestead here in Happy Valley. He said, "You know, Bill, they are going to need a few real Ganymede farmers here to give the greenhorns the straight dope. And who knows more about Ganymede-style farming than I do?"

"Almost everybody," I assured him.

He ignored it. "This place has really got it," he went on, gazing around at a stretch of country that looked like Armageddon after a hard battle. "Much better than around Leda."

I admitted that it had possibilities. "But I don't think it's for me," I went on. "I don't think I'd care to settle anywhere where you can't see Jupiter."

"Nonsense!" he answered. "Did you come here to stare at the sights or to make a farm?"

"That's a moot point," I admitted. "Sometimes I think one thing, sometimes the other. Sometimes I don't have the foggiest idea."

He wasn't listening. "See that slot up there?"

"Sure. What about it?"

"If we crossed that little glacier, we could get up to it."

"Why?"

"I think it leads into another valley—which might be even better. Nobody has been up there. I know—I was in the topo gang."

"I've been trying to help you forget that," I told him. "But why look at all? There must be a hundred thousand valleys on Ganymede that nobody has looked at. Are you in the real estate business?" It didn't appeal to me. There is something that gets you about virgin soil on Ganymede; I wanted to stay in sight of camp. It was quiet as a library —quieter. On Earth there is always some sound, even in the desert.

After a while the stillness and the bare rocks and the ice and the craters get on my nerves.

"Come on! Don't be a sissyl" he answered, and started climbing.

The slot did not lead to another valley; it led into a sort of corridor in the hills. One wall was curiously flat, as if it had been built that way on purpose. We went along it a way, and I was ready to turn back and had stopped to call to Hank, who had climbed the loose rock on the other side to get a picture. As I turned, my eye caught some color and I moved up to see what it was. It was the crystals.

I stared at them and they seemed to stare back. I called, "Hey! Hank! Come here on the bounce!"

"What's up?"

"Come here! Here's something worth taking a picture of."

He scrambled down and joined me. After a bit he let out his breath and whispered, "Well, I'll be fried on Friday!"

Hank got busy with his camera. I never saw such crystals, not even stalactites in caves. They were six-sided, except a few that were three-sided and some that were twelve-sided. They came anywhere from little squatty fellows no bigger than a button mushroom up to tall, slender stalks, knee high. Later on and further up we found some chest high.

They were not simple prisms; they branched and budded. But the thing that got you was the colors.

They were all colors and they changed color as you looked at them. We finally decided that they didn't have any color at all; it was just refraction of light. At least Hank thought so.

He shot a full cartridge of pictures then said, "Come on. Let's see where they come from."

I didn't want to. I was shaky from the climb and my right side was giving me fits every step I took. I guess I was dizzy, too; when I looked at the crystals they seemed to writhe around and I would have to blink my eyes to steady them.

But Hank had already started so I followed. The crystals seemed to keep to what would have been the water bed of the canyon, had it been spring. They seemed to need water. We came to a place where there was a drift of ice across the floor of the corridor —ancient ice, with a thin layer of last winter's snow on top of it. The crystals had carved a passage right through it, a natural bridge of ice, and had cleared a space of several feet on each side of where they were growing, as well.

Hank lost his footing as we scrambled through and snatched at one of the crystals. It broke off with a sharp, clear note, like a silver bell.

Hank straightened up and stood looking at his hand. There were parallel cuts across his palm and fingers. He stared at them stupidly.

"That'll teach you," I said, and then got out a first-lid kit and bandaged it for him. When I had finished I said, "Now let's go back."

"Shucks," he said. "What's a few little cuts? Come

I said, "Look, Hank, I want to go back. I don't feel good."

"What's the matter?"

"Stomach ache."

"You eat too much; that's your trouble. The exercise will do you good."

"No, Hank. I've got to go back."

He stared up the ravine and looked fretful. Finally he said, "Bill, I think I see where the crystals come from, not very far up. You wait here and let me take a look. Then I'll come back and well head for camp. I won't be gone long; honest I won't."

"Okay," I agreed. He started up; shortly I followed him. I had had it pounded into my head as a Cub not to get separated in a strange country.

After a bit I heard him shout. I looked up and saw him standing, facing a great dark hole in the cliff. I called out, "What's the matter?"

He answered:

"GREAT JUMPING HOLY SMOKE!!!"–like that.

"What's the matter?" I repeated irritably and hurried along until I was standing beside him.

The crystals continued up the place where we were. They came right to the cave mouth, but did not go in; they formed a solid dense thicket across the threshold. Lying across the floor of the ravine, as if it had been tumbled there by an upheaval like the big quake, was a flat rock, a monolith, Stonehenge size. You could see where it had broken off the cliff, uncovering the hole. The plane of cleavage was as sharp and smooth as anything done by the ancient Egyptians.

But that wasn't what we were looking at; we were looking into the hole.

It was dark inside, but diffused light, reflected off the canyon floor and the far wall, filtered inside. My eyes began to adjust and I could see what Hank was staring at, what he had exploded about.

There were things in there and they weren't natural

I couldn't have told you what sort of things because they were like nothing I had ever seen before in my life, or seen pictures of—or heard of. How can you describe what you've never seen before and have no words for? Shucks, you can't even see a thing properly the first time you see it; your eye doesn't take in the pattern.

But I could see this: they weren't rocks, they weren't plants, they weren't animals. They were made things, man made—well, maybe not "man" made, but not things that just happen, either.

I wanted very badly to get up close to them and see what they were. For the moment, I forgot I was sick.

So did Hank. As usual he said, "Come onl Let's go!"

But I said, "How?"

"Why, we just—" He stopped and took another look. "Well, let's see, we go around— No. Hmm . . . Bill, we will have to bust up some of those crystals and go right through the middle. There's no other way to get in."

I said, "Isn't one chopped up hand enough for you?"

"I'll bust 'em with a rock. It seems a shame; they are so pretty, but that's what I'll have to do."

"I don't think you can bust those big ones. Besides that, I'll give you two to one that they are sharp enough to cut through your boots."

"I'll chance it." He found a chunk of rock and made an experiment; I was right on both counts. Hank stopped and looked the situation over, whistling softly. "Bill—"

"Yeah?"

"See that little ledge over the opening?"

"What about it?"

"It comes out to the left further than the crystals do. I'm going to pile rock up high enough for us to reach it, then we can go along it and drop down right in front of the cave mouth. The crystals don't come that close."

I looked it over and decided it would work. "But how do we get back?"

"We can pile up some of that stuff we can see inside and shinny up again. At the very worst I can boost you up on my shoulders and then you can reach down your belt to me, or something."

If I had my wits about me, maybe I would have protested. But we tried it and it worked—worked right up to the point where I was hanging by my fingers from the ledge over the cave mouth.

I felt a stabbing pain in my side and let go.

I came to with Hank shaking me. "Let me alone!" I growled.

"You knocked yourself out," he said. "I didn't know you were so clumsy." I didn't answer. I just gathered my knees up to my stomach and closed my eyes.

Hank shook me again. "Don't you want to see what's in here?"

I kicked at him. "I don't want to see the Queen of Sheba! Can't you see I'm sick?" I closed my eyes again.

I must have passed out. When I woke up, Hank was sitting Turk fashion in front of me, with my torch in his hand. "You've been asleep a long time, fellow," he said gently. "Feel any better?"

"Not much."

'Try to pull yourself together and come along with me. You've got to see this, Bill. You won't believe it. This is the greatest discovery since—well, since— Never mind; Columbus was a piker. We're famous, Bill."

"You may be famous," I said. "I'm sick."

"Where does it hurt?"

"All over. My stomach is hard as a rock—a rock with a toothache."

"Bill," he said seriously, "have you ever had your appendix out?"

"No."

"Hmmm… maybe you should have had it out."

"Well, this is a fine time to tell me!"

"Take it easy."

"Take it easy, my foot!" I got up on one elbow, my head swimming. "Hank, listen to me. You've got to get back to camp and tell them. Have them send a tractor for me."

"Look, Bill," he said gently, "you know there isn't anything like a tractor at camp."

I tried to struggle with the problem but it was too much for me. My brain was fuzzy. "Well, have them bring a stretcher, at least," I said peevishly and lay down again.

Some time later I felt him fumbling around with my clothes. I tried to push him away, then I felt something very cold on me. I took a wild swing at him; it didn't connect.

"Steady," he said. "I have found some ice. Don't squirm around or you'll knock off the pack."

"I don't want it."

"You've got to have it. You keep that ice pack in place until we get out of here and you may live to be hanged, yet."

I was too feeble to resist. I lay back down and closed my eyes again. When I opened my eyes again, I was amazed to feel better. Instead of feeling ready to die, I merely felt awful. Hank wasn't around; I called to him. When he didn't answer at once I felt panicky.

Then he came trotting up, waving the torch. "I thought you had gone," I said.

"No. To tell the truth, I can't get out of here. I can't get back up to the ledge and I can't get over the crystals. I tried it." He held up one boot; it was in shreds and there was blood on it.

"Hurt yourself?"

"I'll live."

"I wonder," I answered. "Nobody knows we are here—and you say we can't get out. Looks like we starve. Not that I give a hoot."

'Speaking of that," he said. "I saved you some of our lunch. I'm afraid I didn't leave much; you were asleep a long, long time."

"Don't mention food!" I retched and grabbed at my side.

"Sorry. But look—I didn't say we couldn't get out"

"But you did."

"No, I said I couldn't get out."

"What's the difference?"

"Uh, never mind. But I think we'll get out. It was what you said about getting a tractor——"

"Tractor? Are you out of your head?"

"Skip it," Bill answered. "There is a sort of tractor thing back there—or more like a scaffolding, maybe."

"Make up your mind."

"Call it a wagon. I think I can get it out, at least across the crystals. We could use it as a bridge."

"Well, roll it out."

"It doesn't roll. It, uh-well, it walks."

I tried to get up. "This I got to see."

"Just move over out of the way of the door."

I managed to get to my feet, with Hank helping me. "I'm coming along."

"Want the ice pack changed?"

"Later, maybe." Hank took me back and showed me. I don't know how to describe the walker wagon–maybe you've seen pictures since. If a centipede were a dinosaur and made of metal to boot, it would be a walker wagon. The body of it was a sort of trough and it was supported by thirty-eight legs, nineteen on a side.

"That," I said, "is the craziest contraption I ever laid eyes on. You'll never shove it out the door."

"Wait until you see," he advised. "And if you think this is crazy, you should see the other things in here."

"Such as?"

"Bill, you know what I think this place is? I think it's a hangar for a space ship."

"Huh? Don't be silly; space ships don't have hangars."

"This one has."

"You mean you saw a space ship in here?"

"Well, I don't know. It's not like any I ever saw before, but if it's not a space ship, I don't know what it is good for."

I wanted to go see, but Hank objected. "Another time, Bill; we've got to get back to camp. We're late as it is."

I didn't put up any fight. My side was paining me again, from the walk. "Okay, what happens next?"

"Like this." He led me around to the end of the contraption; the trough came nearly down to the floor in back. Hank helped me get inside, told me to lie down, and went up to the other end. 'The guy that built this," he said, "must have been a hump-backed midget with four arms. Hang on."

"Do you know what you're doing?" I asked.

"I moved it about six feet before; then I lost my nerve. Abracadabra! Hold onto your hat!" He poked a finger deep into a hole.

The thing began to move, silently, gently, without any fuss. When we came out into the sunshine, Hank pulled his finger out of the hole. I sat up. The thing was two thirds out of the cave and the front end was beyond the crystals.

I sighed. "You made it, Hank, Let's get going. If I had some more ice on my side I think I could walk."

"Wait a second," he said. "I want to try something. There are holes here I haven't stuck a finger in yet."

"Leave well enough alone."

Instead of answering he tried another hole. The machine backed up suddenly. "Woopsl" he said, jerked his finger out, and jabbed it back where it had been before. He left it there until he regained what we had lost.

He tried other holes more cautiously. At last he found one which caused the machine to rear up its front end slightly and swing it to the left, like a caterpillar. "Now we are in business," he said happily. "I can steer it." We started down the canyon.

Hank was not entirely correct in thinking he could guide it. It was more like guiding a horse than a machine—or perhaps more like guiding one of those new groundmobiles with the semiautomatic steering. The walker wagon came to the little natural bridge of ice through which the crystals passed and stopped of itself. Hank tried to get it to go through the opening, which was large enough; it would have none of it. The front end cast around like a dog sniffing, then eased gradually up hill and around the ice.

It stayed level; apparently it could adjust its legs, like the fabulous hillside snee.

When Hank came to the ice flow we had crossed on the way up to the notch, he stopped it and gave me a fresh ice pack. Apparently it did not object to ice in itself, but simply refused to go through holes, for when we started up again, it crossed the little glacier, slowly and cautiously, but steadily.

We headed on toward camp. "This," Hank announced happily, "is the greatest cross-country, rough-terrain vehicle ever built. I wish I knew what makes it go. If I had the patent on this thing, I'd be rich."

"It's yours; you found it."

"It doesn't really belong to me."

"Hank," I answered, "you don't really think the owner is going to come back looking for it, do you?"

He got a very odd look. "No, I don't, Bill. Say, Bill, uh, how long ago do you think this thing was put in there?"

"I wouldn't even want to guess."

There was only one tent at the camp site. As we came up to it, somebody came out and waited for us. It was Sergei.

"Where have you guys been?" he asked. "And where in Kingdom Come did you steal that?

"And what is it?" he added.

We did our best to bring him up to date, and presently he did the same for us. They had searched for us as long as they could, then Paul had been forced to move back to camp number one to keep the date with the Jitterbug. He had left Sergei behind to fetch us when we showed up. "He left a note for you," Sergei added, digging it out

It read:

"Dear Pen Pals,

"I am sorry to go off and leave you crazy galoots but you know the schedule as well as I do. I would stay behind myself to herd you home, but your pal Sergei insists that it is his privilege. Every time I try to reason with him he crawls further back into his hole, bares his teeth, and growls.

"As soon as you get this, get your chubby little legs to moving in the direction of camp number one. Run, do not walk. We'll hold the Jitterbug, but you know how dear old Aunt Hattie feels about keeping her schedule. She isn't going to like it if you are late.

"When I see you, I intend to beat your ears down around your shoulders.

"Good luck,

"P. du M.

"P.S. to Doctor Slop: I took care of your accordion."

When we had finished reading it Sergei said, "I want to hear more about what you found—about eight times more. But not now; we've got to tear over to camp number one. Hank, you think Bill can't walk it?"

I answered for myself, an emphatic "no." The excitement was wearing off and I was feeling worse again.

"Hmm—Hank, do you think that mobile junk yard will carry us over there?"

"I think it will carry us any place." Hank patted it.

"How fast? The Jitterbug has already grounded."

"Are you sure?" asked Hank.

"I saw its trail in the sky at least three hours ago."

"Let's get going!"

I don't remember much about the trip. They stopped once in the pass, and packed me with ice again. The next thing I knew I was awakened by hearing Sergei shout, "There's the Jitterbug! I can see it."

"Jitterbug, here we come," answered Hank. I sat up and looked, too.

We were coming down the slope, not five miles from it, when flame burst from its tail and it climbed for the sky.

Hank groaned. I lay back down and closed my eyes.

I woke up again when the contraption stopped. Paul was there, hands on his hips, staring at us. "About time you birds got home," he announced. "But where did you find that?"

"Paul," Hank said urgently, "Bill is very sick."

"Oh, oh!" Paul swung up and into the walker and made no more questions then. A moment later he had my belly bared and was shoving a thumb into that spot between the belly button and the hip bone. "Does that hurt?" he asked.

I was too weak to slug him. He gave me a pill.

I took no further part in events for a while, but what had happened was this: Captain Hattie had waited, at Paul's urgent insistence, for a couple of hours, and then had announced that she had to blast. She had a schedule to keep with the Covered Wagon and she had no intention, she said, of keeping eight thousand people waiting for the benefit of two. Hank and I could play Indian if we liked; we couldn't play hob with her schedule.

There was nothing Paul could do, so he sent the rest back and waited for us.

But I didn't hear this at the time. I was vaguely aware that we were in the walker wagon, travelling, and I woke up twice when I was repacked with ice, but the whole episode is foggy. They travelled east, with Hank driving and Paul navigating—by the seat of his pants. Some long dreamy time later they reached a pioneer camp surveying a site over a hundred miles away—and from there Paul radioed for help.

Whereupon the Jitterbug came and got us. I remember the landing back at Leda—that is, I remember somebody saying, "Hurry, there! We've got a boy with a burst appendix."

20. Home

There was considerable excitement over what we had found—and there still is—but I didn't see any of it. I was busy playing games with the Pearly Gates. I guess I have Dr. Archibald to thank for still being here. And Hank. And Sergei. And Paul. And Captain Hattie. And some nameless party, who lived somewhere, a long time ago, whose shape and race I still don't know, but who designed the perfect machine for traveling overland through rough country.

I thanked everybody but him. They all came to see me in the hospital, even Captain Hattie, who growled at me, then leaned over and kissed me on the cheek as she left. I was so surprised I almost bit her.

The Schultzes came, of course, and Mama cried over me and Papa gave me an apple and Gretchen could hardly talk, which isn't like her. And Molly brought the twins down to see me and vice versa.

The Leda daily Planet interviewed me. They wanted to know whether or not we thought the things we found were made by men?

Now that is a hard question to answer and smarter people than myself have worked on it since.

What is a man?

The things Hank and I—and the Project Jove scientists who went later—found in that cave couldn't have been made by men—not men like us. The walker wagon was the simplest thing they found. Most of the things they still haven't found out the use for. Nor have they figured out what the creatures looked like—no pictures.

That seems surprising, but the scientists concluded they didn't have eyes—not eyes like ours, anyhow. So they didn't use pictures.

The very notion of a "picture" seems pretty esoteric when you think it over. The Venetians don't use pictures, nor the Martians. Maybe we are the only race in the universe that thought up that way of recording things.

So they weren't "men"—not like us.

But they were men in the real sense of the word, even though I don't doubt that I would run screaming away if I met one in a dark alley. The important thing, as Mr. Seymour would say, they had—they controlled their environment. They weren't animals, pushed around and forced to accept what nature handed them; they took nature and bent it to their will.

I guess they were men.

The crystals were one of the oddest things about it and I didn't have any opinions on that. Somehow, those crystals were connected with that cave—or space ship hangar, or whatever it was. Yet they couldn't or wouldn't go inside the cave.

Here was another point that the follow-up party from Project Jove recorded: that big unwieldly walker wagon came all the way down that narrow canyon-yet it did not step on a single crystal. Hank must be a pretty good driver. He says he's not that good.

Don't ask me. I don't understand everything that goes on in the universe. It's a big place.

I had lots of time to think before they let me out of the hospital—and lots to think about. I thought about my coming trip to Earth, to go back to school I had missed the Covered Wagon, of course, but that didn't mean anything; I could take the *Mayflower* three weeks later. But did I want to go? It was a close thing to decide.

One thing I was sure of: I was going to take those merit badge tests as soon as I was out of bed. I had put it off too long. A close brush with the hereafter reminds you that you don't have forever to get things done.

But going back to school? That was another matter. For one thing, as Dad told me, the council had lost its suit with the Commission; Dad couldn't use his Earthside assets.

And there was the matter that Paul had talked about the night he had to let his hair down—the coming war.

Did Paul know what he was talking about? If so, was I letting it scare me out? I honestly didn't think so; Paul had said that it was not less than forty years away. I wouldn't be Earthside more than four or five years—and, besides, how could you get scared of anything that far in the future?

I had been through the Quake and the reconstruction; I didn't really think I'd ever be scared of anything again.

I had a private suspicion that, supposing there was a war, I'd go join up; I wouldn't be running away from it. Silly, maybe.

No, I wasn't afraid of the War, but it was on my mind. Why? I finally doped it out. When Paul called I asked him about it. "See here, Paul—this war you were talking about: when Ganymede reaches the state that Earth has gotten into, does that mean war here, too? Not now—a few centuries from now."

He smiled rather sadly. "By then we may know enough to keep from getting into that shape. At least we can hope."

He got a faraway look and added, "A new colony is always a new hope."

I liked that way of putting it. "A new hope—" Once I heard somebody call a new baby that.

I still didn't have the answer about going back when Dad called on me one Sunday night. I put it up to him about the cost of the fare. "I know the land is technically mine, George—but it's too much of a drain on you two."

"Contrariwise," said George, "well get by and that's what savings are for. Molly is for it. We will be sending the twins back for school, you know."

"Even so, I don't feel right about it. And what real use is there in it, George? I don't need a fancy education. I've been thinking about Callisto: there's a brand new planet not touched yet with great opportunities for a man in on the ground floor. I could get a job with the atmosphere expedition—Paul would put in a word for me—and grow up with the project. I might be chief engineer of the whole planet some day."

"Not unless you learn more about thermodynamics than you do now, you won't be!"

"Huh?"

"Engineers don't just 'grow up'; they study. They go to school."

"Don't I study? Ain't I attending two of your classes right now? I can get to be an engineer here; I don't have to drag back half a billion miles for it."

"Fiddlesticks! It takes discipline to study. You haven't even taken your merit badge tests. You've let your Eagle Scoutship lapse."

I wanted to explain that taking tests and studying for tests were two different things—that I had studied. But I couldn't seem to phrase it right.

George stood up. "See here, Son, I'm going to put it to you straight. Never mind about being chief engineer of a planet; these days even a farmer needs the best education he can get. Without it he's just a country bumpkin, a stumbling peasant, poking seeds into the ground and hoping a miracle will make them grow. I want you to go back to Earth and get the best that Earth has to offer. I want you to have a degree with prestige behind it—M.I.T., Harvard, the Sorbonne. Some place noted for scholarship. Take the time to do that and then do anything you want to do. Believe me, it will pay."

I thought about it and answered, "I guess you are right, George."

Dad stood up. "Well, make up your mind. I'll have to hurry now for the bus, or I'll be hoofing it back to the farm. See you tomorrow."

"Good night, George."

I lay awake and thought about it. After a while, Mrs. Dinsmore, the wing nurse, came in, turned out my light, and said goodnight. But I didn't go to sleep.

Dad was right, I knew. I didn't want to be an ignoramus. Furthermore, I had seen the advantage held by men with fancy degrees—first crack at the jobs, fast promotion. Okay, I'd get me one of those sheepskins, then come back and—well, go to Callisto, maybe, or perhaps prove a new parcel of land. I'd go and I'd come back.

Nevertheless I couldn't get to sleep. After a while I glanced at my new watch and saw that it was nearly midnight—dawn in a few minutes. I decided that I wanted to see it It might be the last time I'd be up and around at midnight Sunday for a long, long time.

I scouted the corridor; Old Lady Dinsmore wasn't in sight. I ducked outside.

The Sun was just barely below the horizon; north of me I could see its first rays touching the topmost antenna of the power station, miles away on Pride Peak. It was very still and very beautiful. Overhead old Jupiter was in half phase, bulging and orange and grand. To the west of it Io was just coming out of shadow; it passed from black to cherry red to orange as I watched.

I wondered how I would feel to be back on Earth? How would it feel to weigh three times as much as I did now? I didn't feel heavy; I felt just right.

How would it feel to swim in that thick dirty soup they use for air?

How would it feel to have nobody but ground hogs to talk to? How could I talk to a girl who wasn't a colonial, who had never been off Earth higher than a copter hop? Sissies. Take Gretchen, now—there was a girl who could kill a chicken and have it in the pot while an Earthside girl would still be squealing.

The top of the Sun broke above the horizon and caught the snow on the peaks of the Big Rock Candy Mountains, tinting it rosy against a pale green sky. I began to be able to see the country around me. It was a new, hard, clean place—not like California with its fifty, sixty million people falling over each other. It was my kind' of a place—it was my place.

The deuce with Caltech and Cambridge and those fancy schools! I'd show Dad it didn't take ivied halls to get an education. Yes, and I'd pass those tests and be an Eagle again, first thing.

Hadn't Andrew Johnson, that American President, learned to read while he was working? Even after he was married? Give us time; we'd have as good scientists and scholars here as anywhere.

The long slow dawn went on and the light caught Kneiper's cut west of me, outlining it. I was reminded of the night we had struggled through it in the storm. As Hank put it, there was one good thing about colonial life—it sorted out the men from the boys.

"I have lived and worked with men." The phrase rang through my head. Rhysling? Kipling, maybe. I had lived and worked with men!

The Sun was beginning to reach the roof tops. It spread across Laguna Serenidad, turning it from black to purple to blue. This was my planet, this was my home and I knew that I would never leave it

Mrs. Dinsmore came bustling out to the door and spotted me. "Why, the very idea!" she scolded. "You get back where you belong!"

I smiled at her. "I am where I belong. And I'm going to stay!"

The Puppet Masters

I

Were they truly intelligent? By themselves, that is? I don't know and I don't know how we can ever find out. I'm not a lab man; I'm an operator.

With the Soviets it seems certain that they did not invent anything.

They simply took the communist power-for-power's-sake and extended it without any "rotten liberal sentimentality" as the commissars put it. On the other hand, with animals they were a good deal more than animal.

(It seems strange no longer to see dogs around. When we finally come to grips with them, there will be a few million dogs to avenge. And cats. For me, one particular cat.)

If they were *not* truly intelligent, I hope I never live to see us tangle with anything at all like them, which is intelligent. I know who will lose. Me. You. The so-called human race.

For me it started much too early on July 12, '07, with my phone shrilling in a frequency guaranteed to peel off the skull. I felt around my person, trying to find the thing to shut it off, then recalled that I had left it in my jacket across the room. "All right," I growled. "I hear you. Shut off that damned noise."

"Emergency," a voice said in my ear. "Report in person."

I told him what to do with his emergency. "I'm on a seventy-two hour pass."

"Report to the Old Man," the voice persisted, "at once."

That was different. "Moving," I acknowledged and sat up with a jerk that hurt my eyeballs. I found myself facing a blonde. She was sitting up, too, and staring at me round-eyed.

"Who are you talking to?" she demanded.

I stared back, recalling with difficulty that I had seen her before. "Me? Talking?" I stalled while trying to think up a good lie, then, as I came wider-awake, realized that it did not have to be a very good lie as she could not possibly have heard the other half of the conversation. The sort of phone my section uses is not standard; the audio relay was buried surgically under the skin back of my left ear—bone conduction. "Sorry, babe," I went on. "Had a nightmare. I often talk in my sleep."

"Sure you're all right?"

"I'm fine, now that I'm awake," I assured her, staggering a bit as I stood up. "You go back to sleep."

"Well, uh—" She was breathing regularly almost at once. I went into the bath, injected a quarter grain of "Gyro" in my arm, then let the vibro shake me apart for three minutes while the drug put me back together. I stepped out a new man, or at least a good mock-up of one, and got my jacket. The blonde was snoring gently.

I let my subconscious race back along its track and realized with regret that I did not owe her a damned thing, so I left her. There was nothing in the apartment to give me away, nor even to tell her who I was.

I entered our section offices through a washroom booth in

MacArthur Station. You won't find our offices in the phone lists. In fact, it does not exist. Probably I don't exist either. All is illusion. Another route is through a little hole-in-the-wall shop with a sign reading RARE STAMPS & COINS. Don't try that route either—they'll try to sell you a Tu'penny Black.

Don't try any route. I told you we didn't exist, didn't I?

There is one thing no head of a country can know and that is: how good is his intelligence system? He finds out only by having it fail him. Hence our section. Suspenders *and* belt. United Nations had never heard of us, nor had Central Intelligence—I think. I heard once that we were blanketed into an appropriation for the Department of Food Resources, but I would not know; I was paid in cash.

All I really knew about was the training I had received and the jobs the Old Man sent me on. Interesting jobs, some of them—if you don't care where you sleep, what you eat, nor how long you live. I've totaled three years behind the Curtain; I can drink vodka without blinking and spit Russian like a cat—as well as Cantonese, Kurdish, and some other bad-tasting tongues. I'm prepared to say that they've got nothing behind the Curtain that Paducah, Kentucky doesn't have bigger and better. Still, it's a living.

If I had had any sense, I'd have quit and taken a working job.

The only trouble with that would be that I wouldn't have been working for the Old Man any longer. That made the difference.

Not that he was a soft boss. He was quite capable of saying, "Boys, we need to fertilize this oak tree. Just jump in that hole at its base and I'll cover you up."

We'd have done it. Any of us would.

And the Old Man would bury us alive, too, if he thought that there was as much as a 53 percent probability that it was the Tree of Liberty he was nourishing.

He got up and limped toward me as I came in. I wondered again why he did not have that leg done over. Pride in how he had gotten the limp was my guess, not that I would ever know. A person in the Old Man's position must enjoy his pride in secret; his profession does not allow for public approbation.

His face split in a wicked smile. With his big hairless skull and his strong Roman nose he looked like a cross between Satan and Punch of Punch-and-Judy. "Welcome, Sam," he said. "Sorry to get you out of bed."

The deuce he was sorry! "I was on leave," I answered shortly. He was the Old Man, but leave is leave—and damned seldom!

"Ah, but you still are. We're going on a vacation."

I didn't trust his "vacations" so I did not rise to the bait. "So my name is 'Sam'," I answered. "What's my last name?"

"Cavanaugh. And I'm your Uncle Charlie—Charles M. Cavanaugh, retired. Meet your sister Mary."

I had noticed that there was another person in the room, but had filed my one glance for future reference. When the Old Man is present he gets full attention as long as he wants it. Now I looked over my "sister" more carefully and then looked her over again. It was worth it.

I could see why he had set us up as brother and sister if we were to do a job together; it would give him a trouble-free pattern. An indoctrinated agent can't break his assumed character any more than a professional actor can intentionally muff his lines. So this one I must treat as my sister—a dirty trick if I ever met one!

A long, lean body, but unquestionably and pleasingly mammalian. Good legs. Broad shoulders for a woman. Flaming, wavy red hair and the real redheaded saurian bony structure to her skull. Her face was handsome rather than beautiful; her teeth were sharp and clean. She looked me over as if I were a side of beef.

I was not yet in character; I wanted to drop one wing and run in circles. It must have showed, for the Old Man said gently, "Tut tut, Sammy—there's no incest in the Cavanaugh family. You were both carefully brought up, by my favorite sister-in-law. Your sister dotes on you and you are extremely fond of your sister, but in a healthy, clean-cut, sickeningly chivalrous, All-American-Boy sort of way."

"As bad as that?" I asked, still looking at my "sister".

"Worse."

"Oh, well—howdy, Sis. Glad to know you."

She stuck out a hand. It was firm and seemed as strong as mine. "Hi, Bud." Her voice was deep contralto, which was all I needed. Damn the Old Man!

"I might add," the Old Man went on in the same gentle tones, "that you are so devoted to your sister that you would gladly die to protect her. I dislike to tell you so, Sammy, but your sister is a little more valuable, for the present at least, to the organization than you are."

"Got it," I acknowledged. "Thanks for the polite qualification."

"Now, Sammy—"

"She's my favorite sister; I protect her from dogs and strange men. I don't have to be slapped with an ax. Okay, when do we start?"

"Better stop over in Cosmetics; I think they have a new face for you."

"Make it a whole new head. See you. 'By, Sis."

They did not quite do that, but they did fit my personal phone under the overhang of my skull in back and then cemented hair over it. They dyed my hair to the same shade as that of my newly acquired sister, bleached my skin, and did things to my cheekbones and chin. The mirror showed me to be as good an authentic redhead as Sis. I looked at my hair and tried to recall what its natural shade had been, way back when. Then I wondered if Sis were what she seemed to be along those lines. I rather hoped so. Those teeth, now—Stow it, Sammy! She's your sister.

I put on the kit they gave me and somebody handed me a jump bag, already packed. The Old Man had evidently been in Cosmetics, too; his skull was now covered by crisp curls of a shade just between pink and white. They had done something to his face, for the life of me I could not tell just what—but we were all three clearly related by blood and were all of that curious subrace, the redheads.

"Come, Sammy," he said. "Time is short. I'll brief you in the car." We went up by a route I had not known about and ended up on the Northside launching platform, high above New Brooklyn and overlooking Manhattan Crater.

I drove while the Old Man talked. Once we were out of local control he told me to set it automatic on Des Moines, Iowa. I then joined Mary and "Uncle Charlie" in the lounge. He gave us our personal histories briefly and filled in details to bring us up to date. "So here we are," he concluded, "a merry little family party—tourists. And if we should happen to run into unusual events, that is how we will behave, as nosy and irresponsible tourists might."

"But what is the problem?" I asked. "Or do we play this one entirely by ear?"

"Mmmm . . . possibly."

"Okay. But when you're dead, it's nice to know why you're dead, I always say. Eh, Mary?"

"Mary" did not answer. She had that quality, rare in babes and commendable, of not talking when she had nothing to say. The Old Man looked me over, his manner not that of a man who can't make up his mind, but rather as if he were judging me as I was at that moment and feeding the newly acquired data into the machine between his ears.

Presently he said, "Sam, you've heard of 'flying saucers'."

"Huh? Can't say that I have."

"You've studied history. Come, now!"

"You mean *those*? The flying-saucer craze, 'way back before the Disorders? I thought you meant something recent and real; those were mass hallucinations."

"Were they?"

"Well, weren't they? I haven't studied much statistical abnormal psychology, but I seem to remember an equation. That whole period was psychopathic; a man with all his gaskets tight would have been locked up."

"But this present day is sane, eh?"

"Oh, I wouldn't go so far as to say that." I pawed back through the unused drawers of my mind and found the answer I wanted. "I remember that equation now—Digby's evaluating integral for second and higher order data. It gave a 93.7 percent certainty that the flying-saucer myth, after elimination of explained cases, was hallucination. I remember it because it was the first case of its type in the history of science in which the instances had been systematically collected and evaluated. Some sort of a government project, God knows why."

The Old Man looked benignly avuncular. "Brace yourself, Sammy. We are going to inspect a flying saucer today. Maybe we'll even saw off a piece for a souvenir, like true tourists."

II

"*Seen* a newscast lately?" the Old Man went on.

I shook my head. Silly question—I'd been on leave.

"Try it sometime," he suggested. "Lots of interesting things on the 'casts. Never mind. Seventeen hours—" he glanced at his finger watch and added, "—and twentythree minutes ago an unidentified spaceship landed near Grinnell, Iowa. Type, unknown. Approximately disc-shaped and about one hundred fifty feet across. Origin, unknown, but—"

"Didn't they track a trajectory on it?" I interrupted.

"They did not," he answered, spacing his words. "Here is a photo of it taken after landing by Space Station Beta."

I looked it over and passed it to Mary. It was as unsatisfactory as a telephoto taken from five thousand miles out usually is. Trees looking like moss . . . a cloud shadow that loused up the best part of the pic . . . and a gray circle that might have been a disc-shaped space ship and could just as well have been an oil tank or a water reservoir. I wondered how many times we had bombed hydroponics plants in Siberia, mistaking them for atomic installations.

Mary handed the pic back. I said, "Looks like a tent for a camp meeting to me. What else do we know?"

"Nothing."

"Nothing! After *seventeen hours*? We ought to have agents pouring out of their ears!"

"Ah, yes. We did have. Two within reach and four that were sent in. They failed to report back. I dislike losing agents, Sammy, especially with no results."

Up to then I had not stopped to wonder about the Old Man himself being risked on a job—it had not looked like risk. But I had a sudden cold realization that the situation must be so serious that the Old Man had chosen to bet his own brain against the loss of the organization—for he *was* the Section. Nobody who knew him doubted his guts, but they did not doubt his horse sense, either. He knew his own value; he would not risk himself unless he believed coldly that it would take his own skill to swing it and that the job *had* to be done.

I felt suddenly chilly. Ordinarily an agent has a duty to save his own neck—in order to complete his mission and report back. On this job it was the Old Man who must come back—and after him, Mary. I stood number three and was as expendable as a paper clip. I didn't like it.

"One agent made a partial report," the Old Man went on. "He went in as a casual bystander and reported by phone that it must be a space ship although he could not determine its motive power. We got the same thing from the newscasts. He then reported that the ship was opening and that he was going to try to get closer, past the police lines. The last thing he said was, 'Here they come. They are little creatures, about—' Then he shut off."

"Little men?"

"He said, 'creatures'."

"Peripheral reports?"

"Plenty of them. The Des Moines stereocasting station reported the landing and sent mobile units in for spot cast. The pictures they sent out were all fairly long shots, taken from the air. They showed nothing but a disc-shaped object. Then, for about two hours, no pictures and no news, followed later by close ups and a new news slant."

The Old Man shut up. I said, "Well?"

"The whole thing was a hoax. The 'space ship' was a sheet metal and plastic fraud, built by two farm boys in some woods near their home. The fake reports originated with an announcer with more sense of humor than good judgment and who had put the boys up to it to make a story. He has been fired and the latest 'invasion from outer space' turns out to be a joke."

I squirmed. "So it's a hoax—but we lose six men. We're going to look for them?"

"No, for we would not find them. We are going to try to find out why triangulation of this photograph—" He held up the teleshot taken from the space station. "—doesn't quite jibe with the news reports—and why Des Moines stereo station shut up for a while."

Mary spoke up for the first time. "I'd like to talk with those farm boys."

I roaded the car about five miles this side of Grinnell and we started looking for the McLain farm—the news reports had named Vincent and George McLain as the culprits. It wasn't hard to find. At a fork in the road was a big sign, professional in appearance: THIS WAY TO THE SPACESHIP. Shortly the road was parked both sides with duos and groundcars and triphibs. A couple of hastily built stands dispensed cold drinks and souvenirs at the turnoff into the McLain place. A state cop was directing traffic.

"Pull up," directed the Old Man. "Might as well see the fun, eh?"

"Right, Uncle Charlie," I agreed.

The Old Man bounced out with only a trace of limp, swinging his cane. I handed Mary out and she snuggled up to me, grasping my arm. She looked up at me, managing to look both stupid and demure. "My, but you're strong. Buddy."

I wanted to slap her, but gave a selfconscious smirk instead. That poor-little-me routine—from an agent, from one of the Old Man's agents. A smile from a tiger.

"Uncle Charlie" buzzed around, bothering state police, buttonholing people to give them unasked-for opinions, stopping to buy cigars at one of the stands, and in general giving a picture of a well-to-do, senile old fool, out for a holiday. He turned back to us and waved his cigar at a state sergeant. "The inspector says the whole thing is a fraud, my dears—a prank thought up by some boys. Shall we go?"

Mary looked disappointed. "No space ship?"

"There's a space ship, if you want to call it that," the cop answered. "Just follow the suckers, and you'll find it. It's 'sergeant', not 'inspector'."

"Uncle Charlie" pressed a cigar on him and we set out, across a pasture and into some woods. It cost a dollar to get through the gate and many of the potential suckers turned back. The path through the woods was rather deserted. I moved carefully, wishing for eyes in the back of my head instead of a phone. According to the book six agents had gone down this path and none had come back. I didn't want it to be nine.

Uncle Charlie and Sis walked ahead, Mary chattering like a fool and somehow managing to be both shorter and younger than she had been on the trip out. We came to a clearing and there was the "space ship".

It was the proper size, more than a hundred feet across, but it was whipped together out of light-gauge metal and sheet plastic, sprayed with aluminum. It was roughly the shape of two giant pie plates, face to face. Aside from that, it looked like nothing in particular. Nevertheless Mary squealed. "Oh, how exciting!"

A youngster, eighteen or nineteen, with a permanent sunburn and a pimply face, stuck his head out of a sort of hatch in the top of the monstrosity. "Care to see inside?" he called out. He added that it would be fifty cents a piece more and Uncle Charlie shelled out.

Mary hesitated at the hatch. Pimple face was joined by what appeared to be his twin and they started to hand her down in. She drew back and I moved in fast, intending to do any handling myself. My reasons were 99 percent professional; I could feel danger all through the place. "It's dark in there," she quavered.

"It's perfectly safe," the second young man said. "We've been taking sightseers through all day. I'm Vinc McLain, one of the owners. Come on, lady."

Uncle Charlie peered down the hatch, like a cautious mother hen. "Might be snakes in there," he decided. "Mary, I don't think you had better go in."

"Nothing to fear," the first McLain said insistently. "It's safe as houses."

"Just keep the money, gentlemen." Uncle Charlie glanced at his finger. "We're late as it is. Let's go, my dears."

I followed them back up the path, my hackles up the whole way.

We got back to the car and I pulled out into the road. Once we were rolling, the Old Man said sharply, "Well? What did you see?"

I countered with, "Any doubt about that first report? The one that broke off?"

"None."

"That thing over in the woods wouldn't have fooled an agent, even in the dark. This wasn't the ship he saw."

"Of course not. What else?"

"How much would you say that fake cost? That was new sheet metal, fresh paint, and from what I saw of the inside through the hatch, probably a thousand feet, more or less, of lumber to brace it."

"Go on."

"Well, the McLain house hadn't been painted in years, not even the barn. The place had 'mortgage' spelled out all over it. If the boys were in on the gag, they didn't foot the bill."

"Obviously. You, Mary?"

"Uncle Charlie, did you notice the way they treated me?"

"Who?" I said sharply.

"Both the state sergeant and the two boys. When I use the sweet-little-bundle-of-sex routine, something should happen. Nothing did."

"They were all attentive," I objected.

"You don't understand. You can't understand—but I *know*. I always know. Something was wrong with them. They were dead inside. Harem guards, if you know what I mean."

"Hypnosis?" asked the Old Man.

"Possibly. Or drugs perhaps." She frowned and looked puzzled.

"Hmm—" he answered. "Sammy, take the next turn to the left.

We're investigating a point about two miles south of here."

"The triangulated location by the pic?"

"What else?"

But we didn't get there. First it was a bridge out and I didn't have room enough to make the car hop it, quite aside from the small matter of traffic regulations for a duo on the ground. We circled to the south and came in again, the only remaining route. We were stopped by a highway cop and a detour sign. A brush fire, he told us; go any farther and we would probably be impressed into firefighting. He didn't know but what he ought to send me up to the firelines anyhow.

Mary waved her lashes and other things at him and he relented. She pointed out that neither she nor Uncle Charlie could drive, a double lie.

After we pulled away I asked her, "How about that one?"

"What about him?"

"Harem guard?"

"Oh, my, no! A most attractive man."

Her answer annoyed me.

The Old Man vetoed taking to the air and making a pass over the triangulated spot. He said it was useless. We headed for Des Moines. Instead of parking at the toll gates we paid to take the car into the city proper, and ended up at the main studios of Des Moines stereo. "Uncle Charlie" blustered his way into the office of the general manager, us in tow. He told several lies—or perhaps Charles M. Cavanaugh was actually a big wheel with the Federal Communications Authority. How was I to know?

Once inside and the door shut he continued the Big Brass act. "Now, sir, what is all this nonsense about a spaceship hoax? Speak plainly, sir; I warn you your license may depend on it."

The manager was a little round-shouldered man, but he did not seem cowed, merely annoyed. "We've made a full explanation over the channels," he said. "We were victimized by one of our own people. The man has been discharged."

"Hardly adequate, sir."

The little man—Barnes, his name was—shrugged. "What do you expect? Shall we string him up by his thumbs?"

Uncle Charlie pointed his cigar at him. "I warn you, sir, that I am not to be trifled with. I have been making an investigation of my own and I am not convinced that two farm louts and a junior announcer could have pulled off this preposterous business. There was money in it, sir. Yes, sir—money. And where would I expect to find money? Here at the top. Now tell me, sir, just what did you—"

Mary had seated herself close by Barnes's desk. She had done something to her costume, which exposed more skin, and her pose put me in mind of Goya's *Disrobed Lady*. She made a thumbs-down signal to the Old Man.

Barnes should not have caught it; his attention appeared to be turned to the Old Man. But he did. He turned toward Mary and his face went dead. He reached for his desk.

"Sam! Kill him!" the Old Man rapped.

I burned his legs off and his trunk fell to the floor. It was a poor shot; I had intended to burn his belly.

I stepped quickly to him and kicked his gun away from his still-groping fingers. I was about to give him the *coup de grace*—a man burned that way is dead, but it takes him a while to die—when the Old Man snapped, "Don't touch him! Mary, stand back!"

We did so. The Old Man sidled toward the body, like a cat cautiously investigating the unknown. Barnes gave a long bubbling sigh and was quiet—shock death; a gun burn doesn't bleed much, not that much. The Old Man looked him over and poked him gently with his cane.

"Boss," I said, "about time to git, isn't it?"

Without looking around he answered, "We're as safe here as anywhere. Safer, probably. This building may be swarming with them."

"Swarming with what?"

"How would I know? Swarming with whatever *he* was." He pointed to Barnes's body. "That's what I've got to find out."

Mary gave a choked sob, the first honest feminine thing I had known her to do, and gasped, "He's still breathing. Look!"

The body lay facedown; the back of the jacket heaved as if the chest were rising. The Old Man looked at it and poked at it with his cane. "Sam. Come here."

I came. "Strip it," he went on. "Use your gloves. And be careful."

"Booby trap?"

"Shut up. Use care."

I don't know what he expected me to find, but he must have had a hunch that was close to truth. I think the bottom part of the Old Man's brain has a builtin integrator which arrives at a logical necessity from minimum facts the way a museum johnny reconstructs an extinct animal from a single bone.

I took him at his word. First pulling on gloves—agent's gloves; I could have stirred boiling acid with my gloved hand, yet I could feel a coin in the dark and call heads or tails—once gloved, I started to turn him over to undress him.

The back was still heaving; I did not like the look of it—unnatural. I placed a palm between the shoulder blades.

A man's back is bone and muscle. This was jelly soft and undulating. I snatched my hand away.

Without a word Mary handed me a fancy pair of scissors from Barnes's desk. I took them and cut the jacket away. Presently I folded it back and we all looked. Underneath the jacket the body was dressed in a light singlet, almost transparent. Between this shirt and the skin, from the neck halfway down the back, was something which was not flesh. A couple of inches thick, it gave the corpse a round-shouldered, or slightly humped, appearance.

It pulsed like a jellyfish.

As we watched, it slid slowly off the back, away from us. I reached out to peel up the singlet, to let us at it; my hand was knocked away by the Old Man's cane. "Make up your mind," I said and rubbed my knuckles.

He did not answer but tucked the end of his cane under the bottom of the shirt and worried it up the trunk. The thing was uncovered.

Grayish, faintly translucent, and shot through with darker structure, shapeless—it reminded me of a giant clot of frogs' eggs. It was clearly alive, for it pulsed and quivered and moved by flowing. As we watched it flowed down into the space between Barnes's arm and chest, filled it and stayed there, unable to go farther.

"The poor devil," the Old Man said softly.

"Huh? *That*?"

"No. Barnes. Remind me to see to it that he gets the Purple Heart, when this is over. If it ever is over." The Old Man straightened up and stumped around the room, as if he had forgotten completely the gray horror nestling in the crook of Barnes's arm.

I drew back a bit and continued to stare at it, my gun ready. It could not move fast; it obviously could not fly; but I did not know what it could do and I was not taking chances. Mary moved closer to me and pressed her shoulder against mine, as if for human comfort. I put my free arm around her.

On a side table there was an untidy stack of cans, the sort used for stereo tapes. The Old Man took a double program can, spilled the reels on the floor, and came back with it. "This will do, I think." He placed the can on the floor, near the thing, and began chivvying it with his cane, trying to irritate it into crawling into the can.

Instead it oozed back until it was almost entirely under the body. I grabbed the free arm and heaved what was left of Barnes away from the spot; the thing clung momentarily, then flopped to the floor. After that, under dear old Uncle Charlie's directions, Mary and I used our guns set at lowest power to force it, by burning the floor close to it, into the can. We got it in, a close fit, and I slapped the cover on.

The Old Man tucked the can under his arm. "On our way, my dears."

On the way out he paused in the partly open door to call out a parting to Barnes, then, after closing the door, stopped at the desk of Barnes's secretary. "I'll be seeing Mr. Barnes again tomorrow," he told her. "No, no appointment. I'll phone first."

Out we went, slow march, the Old Man with the can full of thing under his arm and me with my ears cocked for alarums. Mary played the silly little moron, with a running monologue. The Old Man even paused in the lobby, bought a cigar, and inquired directions, with bumbling, self-important good nature.

Once in the car he gave me directions, then cautioned me against driving fast. The directions led us into a garage. The Old Man sent for the manager and said to him, "Mr. Malone wants this car—immediately." It was a signal I had had occasion to use myself, only then it had been "Mr. Sheffield" who was in a hurry. I knew that the duo would cease to exist in about twenty minutes, save as anonymous spare parts in the service bins.

The manager looked us over, then answered quietly, "Through that door over there." He sent the two mechanics in the room away on errands and we ducked through the door.

We ended up presently in the apartment of an elderly couple; there we became brunets and the Old Man got his bald head back. I acquired a moustache which did nothing for my looks, but I was surprised to find that Mary looked as well dark as she had as a redhead. The "Cavanaugh" combination was dropped; Mary got a chic nurse's costume and I was togged out as a chauffeur while the Old Man became our elderly, invalid employer, complete with shawl and temper tantrums.

A car was waiting for us when we were ready. The trip back was no trouble; we could have remained the carrot-topped Cavanaughs. I kept the screen turned on to Des Moines, but, if the cops had turned up the late Mr. Barnes, the newsboys hadn't heard about it.

We went straight down to the Old Man's office—straight as one can go, that is—and there we opened the can. The Old Man sent for Dr. Graves, the head of the Section's bio lab, and the job was done with handling equipment.

We need not have bothered. What we needed were gas masks, not handling equipment. A stink of decaying organic matter, like the stench from a gangrenous wound, filled the room and forced us to slap the cover back on and speed up the blowers. Graves wrinkled his nose. "What in the world was that?" he demanded. "Puts me in mind of a dead baby."

The Old Man was swearing softly. "You are to find out," he said. "Use handling equipment. Work it in suits, in a germ-free compartment, and *don't* assume that it is dead."

"If that is alive, I'm Queen Anne."

"Maybe you are, but don't take chances. Here is all the help I can give. It's a parasite; it's capable of attaching itself to a host, such as a man, and controlling the host. It is almost certainly extraterrestrial in origin and metabolism."

The lab boss sniffed. "Extraterrestrial parasite on a terrestrial host? Ridiculous! The body chemistries would be incompatible."

The Old Man grunted. "Damn your theories. When we captured it, it was living on a man. If that means it has to be a terrestrial organism, show me where it fits into the scheme of things and where to look for its mates. And quit jumping to conclusions; I want facts."

The biologist stiffened. "You'll get them!"

"Get going. Wait—don't use more of it than necessary for your investigations; I need the major portion as evidence. And don't persist in the silly assumption that the thing is dead; that perfume may be a protective weapon. That thing, if alive, is fantastically dangerous. If it gets on one of your laboratory men, I'll almost certainly have to kill him."

The lab director said nothing more, but he left without some of his cockiness.

The Old Man settled back in his chair, sighed, and closed his eyes. He seemed to have gone to sleep; Mary and I kept quiet. After five minutes or so he opened his eyes, looked at me, and said, "How many mustard plasters the size of that thing Doc just carted out of here can arrive in a space ship as big as that fraud we looked at?"

"Was there a space ship?" I asked. "The evidence seems slim."

"Slim but utterly incontrovertible. There was a ship. There still is a ship."

"We should have examined the site."

"That site would have been our last sight. The other six boys weren't fools. Answer my question."

"I can't. How big the ship was doesn't tell me anything about its payload, when I don't know its propulsion method, the jump it made, or what supply load the passengers require. It's a case of how long is a piece of rope? If you want a horseback guess, I'd say several hundred, maybe several thousand."

"Mmm . . . yes. So there are several hundred, maybe several thousand zombies in the State of Iowa tonight. Or harem guards, as Mary puts it." He thought for a moment. "But how am I to get past them to the harem? We can't go around shooting every round-shouldered man in Iowa; it would cause talk." He smiled feebly.

"I'll put you another question with no answer," I said. "If one space ship lands in Iowa yesterday, how many will land in North Dakota tomorrow? Or in Brazil?"

"Yes, there's that." He looked still more troubled. "I'll answer it by telling you how long is your piece of rope."

"Huh?"

"Long enough to choke you to death. You kids go wash up and enjoy yourselves; you may not have another chance. Don't leave the offices."

I went back to Cosmetics, got my own skin color back and in general resumed my normal appearance, had a soak and a massage, and then went to the staff lounge in search of a drink and some company. I looked around, not knowing whether I was looking for a blonde, brunette, or redhead, but feeling fairly sure that I could spot the right chassis.

It was a redhead. Mary was in a booth, sucking on a drink and looking much as she had looked when she was introduced to me as my sister. "Hi, Sis," I said, sliding in beside her.

She smiled and answered, "Hello, Bud. Drag up a rock," while moving to make room for me.

I dialed for bourbon and water which I needed for medicinal purposes and then said, "Is this your *real* appearance?"

She shook her head. "Not at all. Zebra stripes and two heads. What's yours?"

"My mother smothered me with a pillow the first time she saw me, so I never got a chance to find out."

She again looked me over with that side-of-beef scrutiny, then said, "I can understand her actions, but I am probably more hardened than she was. You'll do, Bud."

"Thanks." I went on, "Let's drop this 'Bud-and-Sis' routine; I find it gives me inhibitions."

"Hmm . . . I think you need inhibitions."

"Me? Not at all. Never any violence with me; I'm more the 'Barkis-is-willing' type." I might have added that, if I laid a hand on her and she happened not to like it. I'd bet that I would draw back a bloody stump. The Old Man's kids are never sissies.

She smiled. "So? Well, note it down that Miss Barkis is *not* willing, at least not this evening." She put down her glass. "Drink up and let's reorder."

We did so and continued to sit there, feeling warm and good, and, for the moment, not worried. There aren't many hours like that, especially in our profession; it makes one savor them.

One of the nicest things about Mary was that she did not turn on the sex, except for professional purposes. I think she knew—I'm *sure* she knew—what a load of it she possessed. But she was too much of a gentleman to use it socially. She kept it turned down low, just enough to keep us both warm and comfortable.

While we sat there, not saying much, I got to thinking how well she would look on the other side of a fireplace. My job being what it was, I had never thought seriously about getting married—and after all, a babe is just a babe; why get excited? But Mary was an agent herself; talking to her would not be like shouting off Echo Mountain. I realized that I had been lonely for one hell of a long time.

"Mary—"

"Yes?"

"Are you married?"

"Eh? Why do you ask? As a matter of fact I'm not—now. But what business—I mean, why does it matter?"

"Well, it might," I persisted.

She shook her head.

"I'm serious," I went on. "Look me over. I've got both hands and both feet. I'm fairly young, and I don't track mud in the house. You could do worse."

She laughed, but her laugh was kindly. "And you could work up better lines than that. I am sure they must have been extemporaneous."

"They were."

"And I won't hold them against you. In fact, I'll forget them. Listen, wolf, your technique is down; just because a woman tells you that she is not going to sleep with you tonight is no reason to lose your head and offer her a contract. Some women would be just mean enough to hold you to it."

"I meant it," I said peevishly.

"So? What salary do you offer?"

"Damn your pretty eyes. If you want that type of contract, I'll go along; you can keep your pay and I'll allot half of mine to you . . . unless you want to retire."

She shook her head. "I didn't mean it; I'd never insist on a settlement contract, not with a man I was willing to marry in the first place—"

"I didn't think you would."

"I was just trying to make you see that you yourself were not serious." She looked me over soberly. "But perhaps you are," she added in a warm, soft voice.

"I am."

She shook her head again. "Agents should not marry. You know that."

"Agents shouldn't marry anyone but agents."

She started to answer, but stopped suddenly. My own phone was talking in my ear, the Old Man's voice, and I knew she was hearing the same thing. "Come into my office," he said.

We both got up without saying anything. Mary stopped me at the door, put a hand on my arm, and looked up into my eyes. "*That* is why it is silly to talk about marriage. We've got this job to finish. All the time we've been talking, you've been thinking about the job and so have I."

"I have not."

"Don't play with me! Consider this, Sam—suppose you were married and you woke up to find one of those things on your wife's shoulders, possessing her." There was horror in her eyes as she went on, "Suppose I woke up and found one of them on *your* shoulders."

"I'll chance it. And I won't let one get to you."

She touched my cheek. "I don't believe you would."

We went on into the Old Man's office.

He looked up just long enough to say, "Come along. We're leaving."

"Where to?" I answered. "Or shouldn't I ask?"

"White House. See the President. Shut up."

I shut.

III

At the beginning of a forest fire or an epidemic there is a short time when a minimum of correct action will contain and destroy. The B. W. boys express it in exponential equations, but you don't need math to understand it; it depends on early diagnosis and prompt action before the thing gets out of hand. What the President needed to do the Old Man had already figured out—declare a national emergency, fence off the Des Moines area, and shoot anybody who tried to slip out, be it a cocker spaniel or grandma with her cookie jar. Then let them out one at a time, stripping them and searching them for parasites. Meantime, use the radar screen, the rocket boys, and the space stations to spot and smash any new landings.

Warn all the other nations including those behind the Curtain, ask for their help—but don't be fussy about international law, for this was a fight for racial survival against an outside invader. For the moment it did not matter where they came from—Mars, Venus, the Jovian satellites, or outside the system entirely. Repel the invasion.

The Old Man had cracked the case, analyzed it, and come up with the right answer in a little more than twenty-four hours. His unique gift was the ability to reason logically with unfamiliar, hard-to-believe facts as easily as with the commonplace. Not much, eh? I have *never* met anyone else who could do it wholeheartedly. Most minds stall dead when faced with facts which conflict with basic beliefs; "I-just-can't-believe-it" is all one word to highbrows and dimwits alike.

But not to the Old Man—and he had the ear of the President.

The Secret Service guards gave us the works, politely. An X-ray went *beep*! and I surrendered my heater. Mary turned out to be a walking arsenal; the machine gave four beeps and a hiccough, although you would have sworn she couldn't hide a tax receipt under what she was wearing. The Old Man surrendered his cane without waiting to be asked; I got the notion he did not want it to be X-rayed.

Our audio capsules gave them trouble. They showed up both by X-ray and by metal detector, but the guards weren't equipped for surgical operations. There was a hurried conference with a presidential secretary and the head guard ruled that anything embedded in the flesh need not be classed as a potential weapon.

They printed us, photographed our retinas, and ushered us into a waiting room. The Old Man was whisked out and in to see the President alone.

"I wonder why we were brought along?" I asked Mary. "The Old Man knows everything we know."

She did not answer, so I spent the time reviewing in my mind the loopholes in the security methods used to guard the President. They do such things much better behind the Curtain; an assassin with any talent could have beaten our safeguards with ease. I got to feeling indignant about it.

After a while we were ushered in. I found I had stage fright so badly I was stumbling over my feet. The Old Man introduced us and I stammered. Mary just bowed.

The President said he was glad to see us and turned on that smile, the way you see it in the stereocasts—and he made us feel that he *was* glad to see us. I felt all warm inside and no longer embarrassed.

And no longer worried. The President, with the Old Man's help, would take action and the dirty horror we had seen would be cleaned up.

The Old Man directed me to report all that I had done and seen and heard on this assignment. I made it brief but complete. I tried to catch his eye when it came to the part about killing Barnes, but he wasn't having any—so I left out the Old Man's order to shoot and made it clear that I had shot to protect another agent—Mary—when I saw Barnes reach for his gun. The Old Man interrupted me. "Make your report complete."

So I filled in the Old Man's order to shoot. The President threw the Old Man a glance at the correction, the only expression he showed. I went on about the parasite thing, went on, in fact, up to that present moment, as nobody told me to stop.

Then it was Mary's turn. She fumbled in trying to explain to the

President why she expected to get some sort of response out of normal men—and had not gotten it out of the McLain boys, the state sergeant, and Barnes. The President helped her . . . by smiling warmly, managing to bow without getting up, and saying, "My dear young lady, I quite believe it."

Mary blushed, then went on. The President listened gravely while she finished. He asked a couple of questions, then sat still for several minutes.

Presently he looked up and spoke to the Old Man. "Andrew," he said, "your section has been invaluable. On at least two occasions your reports have tipped the balance in crucial occasions in history."

The Old Man snorted. "So it's 'no', is it?"

"I did not say so."

"You were about to."

The President shrugged. "I was going to suggest that your young people withdraw, but now it does not matter. Andrew, you are a genius, but even geniuses make mistakes. They overwork themselves and lose their judgment. I'm not a genius but I learned to relax about forty years ago. How long has it been since you had a vacation?"

"Damn your vacations! See here, Tom, I anticipated this; that's why I brought witnesses. They are neither drugged nor instructed. Call in your psych crew; try to shake their stories."

The President shook his head. "You wouldn't have brought witnesses who could be cracked. I'm sure you are cleverer about such things than anyone whom I could bring in to test them. Take this young man—he was willing to risk a murder charge to protect you. You inspire loyalty, Andrew. As for the young lady, really, Andrew, I can't start what amounts to war on a woman's intuition."

Mary took a step forward. "Mr. President," she said very earnestly, "I do know. I know every time. I can't tell you how I know—*but those were not normal male men.*"

He hesitated, then answered, "I do not dispute you. But you have not considered an obvious explanation—that they actually were, ah, 'harem guards'. Pardon me, Miss. There are always such unfortunates in the population. By the laws of chance you ran across four in one day."

Mary shut up. The Old Man did not. "God damn it, Tom—" I shuddered; you don't talk to the President that way. "—I knew you when you were an investigating senator and I was a key man in your investigations. You know I wouldn't bring you this fairy tale if there were any way to explain it away. Facts can't be ignored; they've got to be destroyed, or faced up to. How about that space ship? What was in it? Why couldn't I even reach the spot where it landed?" He hauled out the photograph taken by Space Station Beta and shoved it under the

President's nose.

The President seemed unperturbed. "Ah, yes, facts. Andrew, both you and I have a passion for facts. But I have several sources of information other than your section. Take this photo—you made quite a point of it when you phoned. I've checked the matter. The metes and bounds of the McLain farm as recorded in the local county courthouse check precisely with the triangulated latitude and longitude of this object on this photograph." The President looked up. "Once I absentmindedly turned off a block too soon and got lost in my own neighborhood. You weren't even in your own neighborhood, Andrew."

"Tom—"

"Yes, Andrew?"

"You did not trot out there and check those courthouse maps yourself?"

"Of course not."

"Thank God for that—or you would be carrying three pounds of pulsing tapioca between your shoulder blades this minute—and God save the United States! You can be sure of this: the courthouse clerk and whatever agent was sent to see him, both are hag-ridden by filthy parasites this very moment." The Old Man stared at the ceiling. "Yes, and the Des Moines chief of police, newspaper editors around there, dispatchers, cops, all sorts of key people. Tom, I don't know what we are up against, but *they* know what *we* are, and they are pinching off the nerve cells of our social organism before true messages can get back—or they cover up the true reports with false ones, just as they did with Barnes. Mr. President, you must order an immediate, drastic quarantine of the whole area. There is no other hope!"

"Barnes," the President repeated softly, as if he had heard nothing else. "Andrew, I had hoped to spare you this, but—" He broke off and flipped a key at his desk. "Get me stereo station WDES, Des Moines, the manager's office."

Shortly a screen lighted on his desk; he touched another switch and a solid display in the wall lighted up. We were looking into the room we had been in only a few hours before.

Looking into it past the shoulders of a man who filled most of the screen—Barnes.

Or his twin. When I kill a man, I expect him to stay dead. I was shaken but I still believed in myself—and my heater.

The man in the display said, "You asked for me, Mr. President?" He sounded as if he were dazzled by the honor.

"Yes, thank you. Mr. Barnes, do you recognize any of these people?"

He looked surprised. "I'm afraid not. Should I?"

The Old Man interrupted. "Tell him to call in his office force."

The President looked quizzical but did just that. "Barnes" looked puzzled but complied. They trooped in, girls mostly, and I recognized the secretary who sat outside the manager's door. One of them squealed, "Ooh—it's the *President*," and they all fell to buzzing.

None of them identified us—not surprising with the Old Man and me, but Mary's appearance was just as it had been in that same office, and I will bet that Mary's looks would be burned into the mind of any woman who had ever seen her.

But I noticed one thing about *them*—every single one of them was round-shouldered.

The President eased us out. He put a hand on the Old Man's shoulder. "Seriously, Andrew, take that vacation." He flashed the famous smile. "The Republic won't fall—I'll worry it through till you get back."

Ten minutes later we were standing in the wind on the Rock Creek platform. The Old Man seemed shrunken and, for the first time, old. "What now, boss?"

"Eh? For you two, nothing. You are both on leave until recalled."

"I'd like to take another look at Barnes's office."

"Don't go near the place. Stay out of Iowa. That's an order."

"Mmm—what are you going to do, if I may ask?"

"You heard the President, didn't you? I am going down to Florida and lie in the sun and wait for the world to go to hell. If you have any sense, you'll do the same. There's damned little time."

He squared his shoulders and stumped away. I turned to speak to Mary, but she was gone. His advice seemed awfully good, and it had suddenly occurred to me that waiting for the end of the world might not be too bad, with her help.

I looked around quickly but could not spot her. I trotted off and overtook the Old Man. "Excuse me, Boss. Where did Mary go?"

"Huh? On leave no doubt. Don't bother me."

I considered trying to relay to her through the Section circuit, when I remembered that I did not know her right name, nor her code, nor her I. D. number. I thought of trying to bull it through by describing her, but that was foolishness. Only Cosmetics Records knows the original appearance of an agent—and they won't talk. All I knew about her was that she had twice appeared as a redhead, at least once by choice—and that, for my taste, she was "why men fight". Try punching that into a phone!

Instead I found a room for the night. After I found it I wondered why I had not left the Capital and gone back to my own apartment. Then I wondered if the blonde were still in it. Then I wondered who the blonde was, anyway? Then I went to sleep.

IV

I woke up at dusk. The room I was in had a real window—the Section pays well and I could afford little luxuries. I looked out over the Capital as it came to life for the night. The river swept away in a wide bend past the Memorial; it was summer and they were adding fluorescine to the water above the District so the river stood out in curving sweeps of glowing rose and amber and emerald and shining fire. Little pleasure boats cut through the colors, each filled, I had no doubt, with couples up to no good and enjoying it.

On the land, here and there among the older buildings, the bubble domes were lighting up, giving the city a glowing fairyland look. Off to the east, where the Bomb had landed, there were no old buildings at all and the area was an Easter basket of color—giant Easter eggs, lighted from within.

I've seen the Capital at night oftener than most, because of my business, and, while I like the place, I had not thought much about it. But tonight I had that "Last Ride Together" feeling. It was so beautiful it hurt but it was not its beauty that choked me up; it was knowing that down under those warm lights were people, alive and individual people, going about their lawful occasions, making love or having spats, whichever suited them . . . doing whatever they damn well pleased, each under his own vine and his own fig tree with nobody to make him afraid, as it says.

I thought about all those gentle, kindly people (with only an occasional heel) and I thought about them each with a gray slug clinging to the back of his neck, twitching his legs and arms, making his voice say what the slug wished, going where the slug wanted to go.

Hell's bells—life under the commissars couldn't be that bad. I know—I've been behind the Curtain.

I made myself a solemn promise: if the parasites won. I'd arrange to be dead before I would let one of those things ride me the way one had ridden Barnes. For an agent it would be simple; just bite my nails—or, if your hands happen to be off, there are a couple of other ways. The Old Man planned for all professional necessities.

But the Old Man had not planned such arrangements for such a purpose and I knew it. It was the Old Man's business—and mine—to keep those people down there safe, not to run out on them when the going got rough.

I turned away from the window. There was not a confounded thing

I could do about it now; I decided that what I needed was company. The room contained the usual catalog of "escort bureaus" and "model agencies" that you'll find in almost any big hotel except maybe the Martha Washington. I thumbed through it, looking the girls over, then slammed it shut. I didn't want a whoopee girl; I wanted one particular girl—one who would as soon shoot as shake hands and would bite in the clinches. And I did not know where she had gone.

I always carry a tube of "tempus fugit" pills; most agents do, as one never knows when giving your reflexes a jolt will get you through a tight spot. Despite the scare propaganda, tempos pills are not habit-forming, not the way the original hashish is.

Nevertheless a purist would say I was addicted to them, for I had the habit of taking them occasionally to make a twenty-four hour leave seem like a week. I admit that I enjoyed the mild euphoria which the pills induced as a side effect. Primarily, though, they just stretch out your subjective time by a factor of ten or more—chop time into finer bits so that you live longer for the same amount of clock and calendar.

What's wrong with that? Sure, I know the horrible example story of the man who died of old age in a calendar month through taking the pills steadily, but I took them only once in a while.

Maybe he had the right idea. He lived a long and happy life—you can be sure it was happy—and died happy at the end. What matter that the sun rose only thirty times? Who is keeping score and what are the rules anyhow?

I sat there, staring at my tube of pills and thinking that I had enough to keep me hopped up and contented for what would be, to me, at least two "years". If I wanted to, I could crawl in my hole and pull it in after me.

I took out two pills and got a glass of water. Then I put them carefully back in the tube, put on my gun and phone, left the hotel and headed for the Library of Congress.

On the way I stopped in a bar for a quick one and looked at a newscast. There was no news from Iowa, but when is there any news from Iowa?

At the Library I went to the general catalog, put on blinkers, and started scanning for references. "Flying Saucers" led to "Flying Discs", then to "Project Saucer", then "Lights in the Sky", "Fireballs", "Cosmic Diffusion Theory of Life Origins", and two dozen blind alleys and screwball branches of literature. I needed some sort of a Geiger counter to tell me what was pay dirt and what was not, especially as what I wanted was almost certain to carry a semantic-content code key classing it somewhere between Aesop's fables and the Lost Continent myths.

Nevertheless, in an hour I had a double handful of selector cards. I handed them to the vestal virgin at the desk and waited while she fed them into the hopper. Presently she said, "Most of the films you want are in use. The rest will be delivered to study room 9-A. Take the south escalator, puhlease."

Room 9-A had one occupant—who looked up as I came in and said, "Well! The wolf in person—how did you manage to pick me up again? I could swear I gave you a clean miss."

I said, "Hello, Mary."

"Hello," she answered, "and now, good-by. Miss Barkis still ain't willin' and I've got work to do."

I got annoyed. "Listen, you conceited little twerp, odd as it may seem to you, I did not come here looking for your no-doubt beautiful white body. I occasionally do some work myself and that is why I'm here. If you will put up with my unwelcome presence until my spools arrive, I'll get the hell out and find another study room—a stag one."

Instead of flaring back, she immediately softened, thereby proving that she was more of a gentleman than I was. "I'm sorry, Sam. A woman hears the same thing so many thousand times that she gets to thinking that no other topic is possible. Sit down."

"No," I answered, "thanks, but I'll take my spools to an unoccupied room. I really do want to work."

"Stay here," she insisted. "Read that notice on the wall. If you remove spools from the room to which they are delivered, you will not only cause the sorter to blow a dozen tubes, but you'll give the chief reference librarian a nervous breakdown."

"I'll bring them back when I'm through with them."

She took my arm and warm tingles went up it. "Please, Sam. I'm sorry."

I sat down and grinned at her. "Nothing could persuade me to leave. I did not expect to find you here, but now that I have, I don't intend to let you out of sight until I know your phone code, your home address, and the true color of your hair."

"Wolf," she said softly, wrinkling her nose. "You'll never know any of them." She made a great business of fitting her head back into her study machine while ignoring me. But I could see that she was not displeased.

The delivery tube went *thunk*! and my spools spilled into the basket. I gathered them up and stacked them on the table by the other machine. One of them rolled over against the ones Mary had stacked up and knocked them down. Mary looked up.

I picked up what I thought was my spool and glanced at the end—the wrong end, as all it held was the serial number and that little pattern of dots which the selector reads. I turned it over, read the label, and placed it in my pile.

"Hey!" said Mary. "That's mine."

"In a pig's eye," I said politely.

"But it is—I read the label when it was faced toward me. It's the one I want next."

Sooner or later, I can see the obvious. Mary wouldn't be there to study the history of footgear through the Middle Ages. I picked up three or four more of hers and read the labels. "So that's why nothing I wanted was in," I said. "But you didn't do a thorough job; I found some that you missed." I handed her my selection.

Mary looked them over, then pushed all the spools into a single pile. "Shall we split them fifty-fifty, or both of us see them all?"

"Fifty-fifty to weed out the junk, then we'll both go over the remainder," I decided. "Let's get busy."

Even after having seen the parasite on poor Barnes's back, even after being solemnly assured by the Old Man that a "flying saucer" had in fact landed, I was not prepared for the monumental pile of evidence to be found buried in a public library. A pest on Digby and his evaluating formula! Digby was a floccinaucinihilipilificator at heart—which is an eight-dollar word meaning a joker who does not believe in anything he can't bite.

The evidence was unmistakable; Earth had been visited by ships from outer space not once but many times.

The reports long antedated our own achievement of space travel; some of them ran back into the seventeenth century—earlier than that, but it was impossible to judge the quality of reports dating back to a time when "science" meant an appeal to Aristotle. The first systematic data came from the United States itself in the 1940's and '50's. The next flurry was in the 1980's, mostly from Russo-Siberia. These reports were difficult to judge as there was no direct evidence from our own intelligence agents and anything that came from behind the Curtain was usually phony, ipso facto.

I noticed something and started taking down dates. Strange objects in the sky appeared to hit a cycle with crests at thirty-year intervals, about. I made a note about it; a statistical analyst might make something of it—or more likely, if I fed it to the Old Man, he would see something in that crystal ball he uses for a brain.

"Flying saucers" were tied in with "mysterious disappearances" not only through being in the same category as sea serpents, bloody rain, and such like wild data, but also because in at least three well-documented instances pilots had chased "saucers" and never come back, or down, anywhere, i.e., officially classed as crashed in wild country and not recovered—an "easy out" or "happy hurdle" type of explanation.

I got another wild hunch and tried to see whether or not there was a thirty-year cycle in mysterious disappearances, and, if so, did it phase-match the objects in-the-sky cycle? There seemed to be but I could not be sure—too much data and not enough fluctuation; there are too many people disappearing every year for other reasons, from amnesia to mothers-in-law.

But vital records have been kept for a long time and not all were lost in the bombings. I noted it down to farm out for professional analysis.

The fact that groups of reports seemed to be geographically and even politically concentrated I did not try very hard to understand. I tabled it, after trying one hunch hypothesis on for size; put yourself in the invaders' place; if you were scouting a strange planet, would you study all of it equally, or would you pick out areas that looked interesting by whatever standards you had and then concentrate?

It was just a guess and I was ready to chuck it before breakfast, if necessary.

Mary and I did not exchange three words all night. Eventually we got up and stretched, then I lent Mary change to pay the machine for the spools of notes she had taken (*why* don't women carry change?) and got my wires out of hock, too. "Well, what's the verdict?" I asked.

"I feel like a sparrow who has built a nice nest and discovers that it is in a rain spout."

I recited the old jingle. "And we'll do the same thing—refuse to learn and build again in the spout."

"Oh, no! Sam, we've got to do something, fast. The President has to be convinced. It makes a full pattern; this time they are moving in to stay."

"Could be. In fact I think they are."

"Well, what do we *do*?"

"Honey chile, you are about to learn that in the Country of the Blind the one-eyed man is in for a hell of a rough ride."

"Don't be cynical. There isn't time."

"No. There isn't. Gather up your gear and let's get out of here."

Dawn was on us as we left and the big library was almost deserted. I said, "Tell you what—let's find a barrel of beer, take it to my hotel room, bust in the head, and talk this thing over."

She shook her head. "Not to your hotel room."

"Damn it, this is business."

"Let's go to my apartment. It's only a couple of hundred miles away; I'll fix you breakfast when we get there."

I recalled my basic purpose in life in time to remember to leer. "That's the best offer I've had all night. But seriously—why not the hotel? We'd get breakfast there and save a half hour's travel."

"You don't want to come to my apartment? I won't bite you."

"I was hoping you would—so I could bite back. No, I was just wondering why the sudden switch?"

"Well—perhaps I wanted to show you the bear traps I have arranged tastefully around my bed. Or perhaps I just wanted to prove to you I could cook." She dimpled for a moment.

I flagged a taxi and we went to her apartment.

When we got inside she left me standing, while she made a careful search of the place, then she came back and said, "Turn around. I want to feel your back."

"Why do—"

"Turn around!"

I shut up and did so. She gave it a good knuckling, all over, then said, "Now you can feel mine."

"With pleasure!" Nevertheless I did a proper job, for I saw what she was driving at. There was nothing under her clothes but girl—girl and assorted items of lethal hardware.

She turned around and let a deep sigh. "That's why I didn't want to go to your hotel room. Now we're safe. Now I *know* we are safe for the first time since I saw that *thing* on the station manager's back. This apartment is tight; I turn off the air and leave it sealed like a vault every time I leave it."

"Say—how about the air conditioning? Could one get in through the ducts?"

"Possibly—but I didn't turn on the conditioner system; I cracked one of the air-raid reserve bottles instead. Never mind; what would you like to eat?"

I wanted to suggest Mary herself, served up on lettuce and toast, but I thought better of it. "Any chance of about two pounds of steak, just warmed through?"

We split a five-pound steak between us and I swear I ate the short half. While we chomped, we watched the newscast. Still no news from Iowa.

V

I did not get to see the bear traps; she locked her bedroom door. I know; I tried it. Three hours later she woke me and we had a second breakfast. Presently we struck cigarettes and I reached over and switched off the newscast. It was devoted principally to a display of the states' entries for "Miss America." Ordinarily I would have watched with interest but since none of the babes was round-shouldered and their contest costumes could not possibly have concealed humps bigger than mosquito bites, it seemed to lack importance that day.

I said, "Well?"

Mary said, "We've got to arrange the facts we have dug up and rub the President's nose in them. Action has to be on a national scale—global, really."

"How?"

"We've got to see him again."

I repeated, "How?"

She had no answer for that one.

I said, "We've got only one route—via official channels. Through the Old Man."

I put in the call, using both our codes so that Mary could hear, too. Presently I heard, "Chief Deputy Oldfield, speaking for the Old Man. He's not available. Shoot."

"It's got to be the Old Man."

There was a pause, then, "I don't have either one of you down as on assignment. Is this official or unofficial?"

"Uh, I guess you'd call it unofficial."

"Well, I won't put you through to the Old Man for anything unofficial. And anything official I am handling. Make up your mind."

I thanked him and switched off before I used any bad language. Then I coded again. The Old Man has a special code, in addition to regular channels, which is guaranteed to cause him to rise up out of his coffin—but God help the agent who uses it unnecessarily. I hadn't used it in five years.

He answered with a burst of profanity.

"Boss," I said, "on the Iowa matter—"

He broke off short. "Yes?"

"Mary and I spent all night digging former data out of the files. We want to talk it over with you."

The profanity resumed. Presently he told me to brief it and turn it in for analysis and added that he intended to have my ears fried for a sandwich.

"Boss!" I said sharply.

"Eh?"

"If you can run out on the job, so can we. Both Mary and I are resigning from the Section right now—and that's official!"

Mary's eyebrows went up but she said nothing. There was a silence so long that I thought he had cut me off, then he said, in a tired, whipped voice, "Palmglade Hotel, North Miami Beach. I'll be the third sunburn from the end."

"Right away." I sent for a taxi and we went up on the roof. I had the hackie swing out over the ocean to avoid the Carolina speed trap;

we made good time.

The Old Man was sunburned all right. He lay there, looking sullen and letting sand dribble through his fingers, while we reported. I had brought along a little buzz box so that he could get it directly off the wire.

He looked up sharply when we came to the point about thirty-year cycles, but he allowed it to ride until he came to my later query about possible similar cycles in disappearances, whereupon he stopped me and called the Section. "Get me Analysis. Hello—Peter? This is the boss. I want a curve on unexplained disappearances, quantitative, starting with 1800. Huh? People, of course—did you think I meant latch keys? Smooth out known factors and discount steady load—what I want to see is humps and valleys. When? I want it two hours ago; what are you waiting for?"

After he switched off he struggled to his feet, let me hand him his cane and said, "Well, back to the jute mill. We've no facilities here."

"To the White House?" Mary asked eagerly.

"Eh? Be your age. You two have picked up nothing that would change the President's mind."

"Oh. Then what?"

"I don't know. Keep quiet, unless you have a bright idea."

The Old Man had a car at hand, of course, and I drove us back. After I turned it over to block control I said, "Boss, I've got a caper that might convince the President, if you can get him to hold still."

He grunted. "Like this," I went on, "send two agents in, me and one other. The other agent carries a portable scanning rig and keeps it trained on me the whole time. You get the President to *watch* what happens."

"Suppose nothing happens?"

"I plan to make it happen. First, I am going where the space ship landed, bull my way on through. We'll get closeup pix of the real ship, piped right into the White House. After that I plan to go back to Barnes's office and investigate those round shoulders. I'll tear shirts off right in front of the camera. There won't be any finesse to the job; I'll just bust things wide open with a sledge hammer."

"You realize you would have the same chance as a mouse at a cat convention."

"I'm not so sure. As I see it, these things haven't any superhuman powers. I'll bet they are strictly limited to whatever the human being they are riding can do—maybe less. I don't plan on being a martyr. In any case I'll get you pix, good ones."

"Hmm—"

"It might work," Mary put in. "I'll be the other agent, I can—"

The Old Man and I said, "No," together—and then I flushed; it was not my prerogative to say so. Mary went on, "I was going to say that I am the logical one because of the, uh, talent I have for spotting a man with a parasite on him."

"No," the Old Man repeated, "It won't be necessary. Where he's going they'll all have riders—assumed so until proved otherwise. Besides, I am saving you for something."

She should have shut up, but for once did not. "For what? This is important."

Instead of snapping at her the Old Man said quietly, "So is the other job. I'm planning to make you a presidential bodyguard, as soon as I can get it through his head that this is serious."

"Oh." She thought about it and answered, "uh, boss—"

"Eh?"

"I'm not certain I could spot a woman who was possessed. I'm not, uh, equipped for it."

"So we take his women secretaries away from him. Ask me a hard one. And Mary—you'll be watching him, too. He's a man, you know."

She turned that over in her mind. "And suppose I find that one has gotten to him, in spite of everything?"

"You take necessary action, the Vice President succeeds to the chair, and you get shot for treason. Simple. Now about this mission. We'll send Jarvis with the scanner and I think I'll include Davidson as an extra hatchet man. While Jarvis keeps the pick-up on you, Davidson can keep his eyes on Jarvis—and you can try to keep one eye on him. Ring-around the-rosy."

"You think it will work, then?"

"No—but any plan of action is better than no plan. Maybe it will stir up something."

While we headed for Iowa—Jarvis, Davidson, and I—the Old Man went back to Washington. He took Mary along. She cornered me as we were about to leave, grabbed me by the ears, kissed me firmly and said, "Sam—try to come back."

I got all tingly and felt like a fifteen-year-old. Second childhood, I guess.

Davidson roaded the car beyond the place where I had found a bridge out. I was navigating, using a large-scale ordnance map on which had been pinpointed the exact landing site of the real space ship. The bridge, which was still out, gave a close-by and precise reference point. We turned off the road two tenths of a mile due east of the site and jeeped through the scrub to the spot. Nobody tried to stop us.

Almost to the spot, I should say. We ran into freshly burned-over ground and decided to walk. The site as shown by the space station photograph was included in the brush fire area—and there was no "flying saucer". It would have taken a better detective than I will ever be to show that one had ever landed there. The fire had destroyed the traces, if any.

Jarvis scanned everything, anyhow, but I knew that the slugs had won another round. As we came out we ran into an elderly farmer; following doctrine we kept a wary distance, although he looked harmless.

"Quite a fire," I remarked, sidling away.

"Sure was," he said dolefully. "Killed two of my best milk cows, the poor dumb brutes. You fellows reporters?"

"Yes," I agreed, "but we've been sent out on a wild-goose chase." I wished Mary were along. Probably this character was naturally round-shouldered. On the other hand, assuming that the Old Man was right about the space ship—and he *had* to be right—then this all-too-innocent bumpkin must know about it and was covering it up. Ergo, he was hag-ridden.

I decided that I had to do it. The chances of capturing a live parasite and getting its picture on the channels back to the White House were better here than they would be in a crowd. I threw a glance at my teammates; they were both alert and Jarvis was scanning.

As the farmer turned to go I tripped him. He went face down and I was on his back like a monkey, clawing at his shirt. Jarvis moved in and got a close up; Davidson moved over to cover point. I had his back bare before he got his wind.

And it was *bare*. It was as clean as mine, no parasite, no sign of one. Nor any place on his body, which I made sure of before I let him up.

I helped him up and brushed him off; his clothes were filthy with ashes and so were mine. "I'm terribly sorry," I said. "I've made a bad mistake."

He was trembling with anger. "You young—" He couldn't seem to find a word bad enough for me. He looked at all of us and his mouth quivered. "I'll have the law on you. If I were twenty years younger I'd lick all three of you."

"Believe me, old timer, it was a mistake."

"Mistake!" His face broke and I thought he was going to cry. "I come back from Omaha and find my place burned, half my stock gone, and my son-in-law no place around. I come out to find out why strangers are snooping around my land and I like to get torn to pieces. Mistake! What's the world coming to?"

I thought I could answer that last one, but I did not try to. I did try to pay him for the indignity but he slapped my money to the ground. We tucked in our tails and got out.

When we were back in the car and rolling again, Davidson said to me, "Are you and the Old Man sure you know what you are up to?"

"I can make a mistake," I said savagely, "but have you ever known the Old Man to?"

"Mmm. . . no. Can't say as I have. Where next?"

"Straight in to WDES main station. This one won't be a mistake."

"Anyhow," Jarvis commented. "I got good pick-up throughout."

I did not answer.

At the toll gates into Des Moines the gatekeeper hesitated when I offered the fee. He glanced at a notebook and then at our plates. "Sheriff has a call out for this car," he said. "Pull over to the right." He left the barrier down.

"Right it is," I agreed, backed up about thirty feet and gunned her for all she was worth. The Section's cars are beefed up and hopped up, too—a good thing, for the barrier was stout. I did not slow down on the far side.

"This," said Davidson dreamily, "is interesting. Do you still know what you are doing?"

"Cut the chatter," I snapped. "I may be crazy but I am still agent-in-charge. Get this, both of you: we aren't likely to get out of this. *But we are going to get those pix*."

"As you say, chief."

I was running ahead of any pursuit. I slammed to a stop in front of the station and we poured out. None of "Uncle Charlie's" indirect methods—we swarmed into the first elevator that was open and punched for the top floor—Barnes's floor. When we got there I left the door of the car open, hoping to use it later.

As we came into the outer office the receptionist tried to stop us but we pushed on by. The girls looked up, startled. I went straight to Barnes's inner door and tried to open it; it was locked. I turned to his secretary. "Where's Barnes?"

"Who is calling, please?" She said, polite as a fish.

I looked down at the fit of the sweater across her shoulders. Humped. By God, I said to myself, this one *has* to be. She was here when I killed Barnes.

I bent over and pulled up her sweater.

I was right. I had to be right. For the second time I stared at the raw flesh of one of the parasites.

I wanted to throw up, but I was too busy. She struggled and clawed and tried to bite. I judo-cut the side of her neck, almost getting my hand in the filthy mess, and she went limp. I gave her three fingers in the pit of her stomach for good measure, then swung her around. "Jarvis," I yelled, "get a close up."

The idiot was fiddling with his gear, bending over it, his big hind end between me and the pick up. He straightened up. "School's out," he said. "Blew a tube."

"Replace it—*hurry*!"

A stenographer stood up on the other side of the room and fired, not at me, not at Jarvis, but at the scanner. Hit it, too—and both Davidson and I burned her down. As if it had been a signal about six of them jumped Davidson. They did not seem to have guns; they just swarmed over him.

I still hung onto the secretary and shot from where I was. I caught a movement out of the corner of my eye and turned to find Barnes—"Barnes" number two—standing in his doorway. I shot him through the chest to be sure to get the slug I knew was on his back. I turned back to the slaughter.

Davidson was up again. A girl crawled toward him; she seemed wounded. He shot her full in the face and she stopped. His next bolt was just past my ear. I looked around and said, "Thanks! Now let's get out of here. Jarvis—come on!"

The elevator was still open and we rushed in, me still burdened with Barnes's secretary. I slammed the door closed and started it. Davidson was trembling and Jarvis was dead white. "Buck up," I said, "you weren't shooting people, you were shooting *things*. Like this." I held the girl's body up and looked down at her back myself.

Then I almost collapsed. My specimen, the one I had grabbed with its host to take back alive, was gone. Slipped to the floor, probably, and oozed away during the ruckus. "Jarvis," I said, "did you get *anything* up there?" He shook his head and said nothing. Neither did I. Neither did Davidson.

The girl's back was covered with a red rash, like a million pinpricks, in the area where the thing had ridden her. I pulled her sweater down and settled her on the floor against the wall of the car. She was still unconscious and likely to stay that way. When we reached street level we left her in the car. Apparently nobody noticed, for there was no hue-and-cry as we went through the lobby to the street.

Our car was still standing there and a policeman had his foot on it while making out a ticket. He handed it to me as we got in. "You know you can't park in this area, Mac," he said reprovingly.

I said, "Sorry," and signed his copy as it seemed the safest and quickest thing to do. Then I gunned the car away from the curb, got as clear as I could of traffic—and blasted her off, right from a city street. I wondered whether or not he added that to the ticket. When I had her up to altitude I remembered to switch the license plates and identification code. The Old Man thinks of everything.

But he did not think much of me when we got back. I tried to report on the way in but he cut me short and ordered us into the Section offices. Mary was there with him. That was all I needed to know; if despite my flop the Old Man had convinced the President she would have stayed.

He let me tell what had happened with only an occasional grunt. "How much did you see?" I asked when I had finished.

"Transmission cut off when you hit the toll barrier," he informed me. "I can't say that the President was impressed by what he saw."

"I suppose not."

"In fact he told me to fire you."

I stiffened. I had been ready to offer my resignation, but this took me by surprise. "I am perfectly will—" I started out.

"Pipe down!" the Old Man snapped. "I told him that he could fire me, but that he could not fire my subordinates. You are a thumb-fingered dolt," he went on more quietly, "but you can't be spared, not now."

"Thanks."

Mary had been wandering restlessly around the room. I had tried to catch her eye, but she was not having any. Now she stopped back of Jarvis's chair—and gave the Old Man the same sign she had given about Barnes.

I hit Jarvis in the side of the head with my heater and he sagged out of his chair.

"Stand back, Davidson!" the Old Man rapped. His own gun was out and pointed at Davidson's chest. "Mary, how about him?"

"He's all right."

"And him."

"Sam's clean."

The Old Man's eyes moved from one of us to the other and I have never felt closer to death. "Both of you peel off your shirts," he said sourly.

We did—and Mary was right on both counts. I had begun to wonder whether or not I would know it if I *did* have a parasite on me. "Now him," the Old Man ordered. "Gloves, both of you."

We stretched Jarvis out on his face and very carefully cut his clothing away. We had our live specimen.

VI

I felt myself ready to retch. The thought of that *thing* travelling right behind me in a closed car all the way from Iowa was almost more than my stomach could stand. I'm not squeamish—I hid once for four days in the sewers of Moscow—but you don't know what the sight of one can do to you unless you yourself have seen one while knowing what it was.

I swallowed hard and said, "Let's see what we can do to work it off. Maybe we can still save Jarvis." I did not really think so; I had a deep-down hunch that anyone who had been ridden by one of those things was spoiled, permanently. I guess I had a superstitious notion that they "ate souls" whatever that means.

The Old Man waved us back. "Forget about Jarvis!"

"But—"

"Stow it! If he can be saved, a bit longer won't matter. In any case—" He shut up and so did I. I knew what he meant; the principle which declared that the individual was all important now called for canceling Jarvis out as a factor, i.e., we were expendable; the people of the United States were not.

Pardon the speech. I liked Jarvis.

The Old Man, gun drawn and wary, continued to watch the unconscious agent and the thing on his back. He said to Mary, "Get the President on the screen. Special code zero zero zero seven."

Mary went to his desk and did so. I heard her talking into the muffler, but my own attention was on the parasite. It made no move to leave its host, but pulsed slowly while iridescent ripples spread across it.

Presently Mary reported, "I can't get him, sir. One of his assistants is on the screen."

"Which one?"

"Mr. McDonough."

The Old Man winced and so did I. McDonough was an intelligent, likeable man who hadn't changed his mind on anything since he was housebroken. The President used him as a buffer.

The Old Man bellowed, not bothering with the muffler.

No, the President was not available. No, he could not be reached with a message. No, Mr. McDonough was not exceeding his authority; the President had been explicit and the Old Man was not on the list of exceptions—if there was such a list, which Mr. McDonough did not concede. Yes, he would be happy to make an appointment; he would squeeze the Old Man in somehow and that was a promise. How would next Friday do? Today? Quite out of the question. Tomorrow? Equally impossible.

The Old Man switched off and I thought he was going to have a stroke. But after a moment he took two deep breaths, his features relaxed, and he slumped back to us, saying, "Dave, slip down the hall and ask Doc Graves to step in. The rest of you keep your distance and your eyes peeled."

The head of the biological lab came in shortly, wiping his hands as he came. "Doc," said the Old Man, "there is one that isn't dead."

Graves looked at Jarvis, then more closely at Jarvis's back. "Interesting," he said. "Unique, possibly." He dropped to one knee.

"Stand back!"

Graves looked up. "But I must have an opportunity—" he said reasonably.

"You and my halfwit aunt! Listen—I want you to study it, yes, but that purpose has low priority. First, you've got to keep it alive. Second, you've got to keep it from escaping. Third, you've got to protect yourself."

Graves smiled. "I'm not afraid of it. I—"

"Be afraid of it! That's an order."

"I was about to say that I think I must rig up an incubator to care for it after we remove it from the host. The dead specimen you gave me did not afford much opportunity for studying its chemistry, but it is evident that these things need oxygen. You smothered the other one. Don't misunderstand me, not free oxygen, but oxygen from its host. Perhaps a large dog would suffice."

"No," snapped the Old Man. "Leave it right where it is."

"Eh?" Graves looked surprised. "Is this man a volunteer?"

The Old Man did not answer. Graves went on, "Human laboratory subjects must be volunteers. Professional ethics, you know."

These scientific laddies never do get broken to harness; I think they keep their bags packed. The Old Man calmed himself and said quietly, "Doctor Graves, every agent in this Section is a volunteer for whatever I find necessary. That is what they sign up for. Please carry out my orders. Get a stretcher in here and take Jarvis out. Use care."

The Old Man dismissed us after they had carted Jarvis away, and Davidson and Mary and I went to the lounge for a drink or four. We needed them. Davidson had the shakes. When the first drink failed to fix him I said, "Look, Dave, I feel as bad about those girls as you do—but it could not be helped. Get that through your head; *it could not be helped*."

"How bad was it?" asked Mary.

"Pretty bad. I don't know how many we killed, maybe six, maybe a dozen. There was no time to be careful. We weren't shooting people, not intentionally; we were shooting parasites." I turned to Davidson. "Don't you see that?"

He seemed to take a brace. "That's just it. They weren't human." He went on, "I think I could shoot my own brother, if the job required it. But these things aren't human. You shoot and they keep coming toward you. They don't—" He broke off.

All I felt was pity. After a bit he got up to go to the dispensary to get a shot for what ailed him. Mary and I talked a while longer, trying to figure out answers and getting nowhere. Then she announced that she was sleepy and headed for the women's dormitory. The Old Man had ordered all hands to sleep in that night, so, after a nightcap, I went to the boys' wing and crawled in a sack.

I did not get to sleep at once. I could hear the rumble of the city above us and I kept imagining it in the state Des Moines was already in.

The air-raid alarm woke me. I stumbled into my clothes as the blowers sighed off, then the intercom bawled in the Old Man's voice, "Antigas and antiradiation procedures! Seal everything—all hands gather in the conference hall. Move!"

Being a field agent I was a supernumerary with no local duties. I shuffled down the tunnel from the living quarters to the Offices. The Old Man was in the big hall, looking grim. I wanted to ask him what was up, but there was a mixed dozen of clerks, agents, stenos, and such there before me and I decided not to. After a bit the Old Man sent me out to get the door tally from the guard on watch. The Old Man called the roll himself and presently it was clear that every living person listed on the door tally was now inside the hall, from old Miss Haines, the Old Man's private secretary, down to the steward of the staff lounge—except the door guard on watch and Jarvis. The tally had to be right; we keep track of who goes in and out a good bit more carefully than a bank keeps track of money.

I was sent out again for the door guard. It took a call back to the Old Man to persuade him it was all right for him to leave his post; he then threw the bolt switch and followed me. When we got back Jarvis was there, being attended by Graves and one of his lab men. He was on his feet and wrapped in a hospital robe, conscious apparently, but he seemed dopey.

When I saw him I began to have some notion of what it was all about. The Old Man did not leave us in doubt. He was facing the assembled staff and keeping his distance; now he drew his gun. "One of the invading parasites is loose among us," he said. "To some of you that means something—too much. To the rest of you I will have to explain, as the safety of all of us—and of our whole race—depends this moment on complete cooperation and utter obedience." He went on to explain briefly but with ugly exactness what a parasite was, what the situation was. "In other words," he concluded, "the parasite is almost certainly here in this room. One of us looks human but is actually an automaton, moving at the will of our deadliest and most dangerous enemy."

There was a murmur from the staff. People stole glances at each other. Some tried to draw away. A moment before we had been a team, picked for temperament compatibility; we were now a mob, each suspicious of the other. I felt it myself and found myself edging away from the man closest to me—Ronald the lounge steward, it was; I had known him for years.

Graves cleared his throat. "Chief," he started in, "I want you to understand that I took every reasonable—"

"Stow it. I don't want excuses. Bring Jarvis out in front. Take his robe off."

Graves shut up and he and his assistant complied. Jarvis did not seem to mind; he seemed only partly aware of his surroundings. There was a nasty blue welt across his left cheekbone and temple, but that was not the cause; I did not hit him that hard. Graves must have drugged him.

"Turn him around," the Old Man ordered. Jarvis let himself be turned; there was the mark of the slug, a red rash on the shoulders and neck. "You can all see," the Old Man went on, "where the thing rode him." There had been some whispers and one embarrassed giggle when Jarvis had been stripped; now there was a dead hush.

"Now," said the Old Man, "we are going *to get that slug*! Furthermore, we are going to capture it alive. That warning is for you eager boys with itchy trigger fingers. You have all seen where a parasite rides on a man. I'm warning you; if the parasite gets burned, I'll burn the man who did it. If you have to shoot the host to catch it, shoot low. Come here!" He pointed his gun at me.

I started toward him; he halted me halfway between the crowd and himself. "Graves! Take Jarvis out of the way. Sit him down behind me. No, leave his robe off," Jarvis was led across the room, still docile, and Graves and his helper rejoined the group. The Old Man turned his attention back to me. "Take out your gun. Drop it on the floor."

The Old Man's gun was pointed at my belly button; I was very careful how I drew mine. I slid it some six feet away from me. "Take off your clothes—all of them."

I am no shrinking violet, but that is an awkward order to carry out. The Old Man's gun overcame my inhibitions.

It did not help any to have some of the younger girls giggling at me as I got down to the buff. One of them said, not too *sotto voce*, "Not bad!" and another replied, "Knobby, I'd say."

I blushed like a bride.

After he looked me over the Old Man told me to pick up my gun and stand beside him. "Back me up," he ordered, "and keep an eye on the door. You! Dotty Something-or-other—you're next."

Dotty was a girl from the clerical pool. She had no gun, of course, and she had evidently been in bed when the alarm sounded; she was dressed in a floor length negligee. She stepped forward, stopped, but did nothing more.

The Old Man waved his gun at her. "Come on—get 'em off! Don't take all night."

"You really mean it?" she said incredulously.

"*Move*!"

She started—almost jumped. "Well!" she said, "no need to take a person's head off." She bit her lower lip and then slowly unfastened the clasp at her waist. "I ought to get a bonus for this," she said defiantly, then threw the robe from her all in one motion.

Whereupon she ruined her buildup by posing for an instant—not long, but you couldn't miss it. I concede that she had something to display, although I was in no mood to appreciate it.

"Over against the wall," the Old Man said savagely. "Renfrew!"

I don't know whether the Old Man alternated men and women on purpose or not, but it was a good idea, as it kept resistance to a minimum. Oh, shucks, I do know—the Old Man never did anything by accident. After my ordeal the men were businesslike though some were obviously embarrassed. As to the women, some giggled and some blushed, but none of them objected too much. I would have found it interesting if the circumstances had been different. As it was, we were all bound to learn things about each other that we had not known. For instance there was a girl whom we used to call "Chesty"—never mind. In twenty minutes or so there were more square yards of gooseflesh exposed than I had ever seen before and the pile of guns on the floor looked like an arsenal.

When Mary's turn came, she set a good example by taking off her clothes quickly and in a completely unprovocative manner—the Old Man should have called her first, instead of that Dotty baggage. Bare, Mary made nothing of it, and wore her skin with quiet dignity. But what I saw did nothing to cool down my feelings about her.

Mary had added considerably to the pile of hardware. I decided she just plain liked guns. Me, I've never found use for more than one.

Finally we were all mother naked and quite evidently free of parasites, except the Old Man himself and his secretary, Miss Haines. I think he was a bit in awe of Miss Haines; she was older than he and inclined to boss him. It dawned on me whom it had to be—if the Old Man were right. He could have been wrong; for all we knew the parasite might be on a ceiling girder, waiting to drop on someone's neck.

The Old Man looked distressed and poked about in the pile of clothing with his cane. He knew that there was nothing in it—or perhaps be was really making sure. Finally he looked up at his secretary. "Miss Haines—if you please. You are next."

I thought to myself. Brother, this time you are going to have to use force.

She did not move. She stood there, facing him down, a statue of offended virginity. I could see that he was about to take action, so I moved closer to him and said, out of the corner of my mouth, "Boss—how about yourself? Take 'em off."

He jerked his head around and looked startled. "I mean it," I said. "It's you or she. It might be either. Get out of those duds."

The Old Man can relax to the inevitable. He said, "Have her stripped. And I'm next." He began fumbling at his zippers, looking grim.

I told Mary to take a couple of the women and peel Miss Haines. When I turned back the Old Man had his trousers at half mast—and Miss Haines chose to make a break for it.

The Old Man was between me and her and I couldn't get in a clean shot—and every other agent in the place was disarmed! Again, I don't think it was accident; the Old Man did not trust them not to shoot when the parasite was discovered. He wanted that slug, alive.

She was out the door and running down the passage by the time I could get organized. I could have winged her in the passageway but I was inhibited by two things—first, I could not shift gears emotionally that fast. I mean to say she was to me still old Lady Haines, the spinster secretary to the boss, the one who bawled me out for poor grammar in my reports. In the second place, if she was carrying a parasite I did not want to risk burning it, not after what we had been told. I am not the world's best shot, anyhow.

She ducked into a room; I came up to it and again I hesitated—sheer habit; it was the ladies' room.

But only a moment. I slammed the door open and looked around, gun ready.

Something hit me back of my right ear. It seemed to me that I took a long leisurely time in getting to the floor.

I can give no clear account of the next few moments. In the first place I was out cold, for a time at least. I remember a struggle and some shouts: "Look out!" "Damn her—she's bitten me!" "Watch your hands! Watch your hands!" Then somebody said more quietly, "Bind her hands and feet, now—careful." Somebody said, "How about him?" and someone else answered, "Later. He's not really hurt."

I was still practically out as they left, but I began to feel a flood of life stirring back into me. I sat up, feeling extreme urgency about something. I got up, staggering a little, and went to the door. I hesitated there, looked out cautiously; nobody was in sight. I stepped out and trotted down the corridor, away from the direction of the conference hall.

I slowed down momentarily at the outer door, then realized with a shock that I was naked and tore on down the hallway toward the men's wing. There I grabbed the first clothes I could find and pulled them on. I found a pair of shoes much too small for me, but it did not seem to matter.

I ran back toward the exit, fumbled, and found the switch; the door opened.

I thought I had made a clean escape, but somebody shouted, "Sam!" just as I was going out. I did not wait, but plunged on out. At once I had my choice of six doors and then three more beyond the one I picked. The warren we called the "Offices", being arranged to permit any number of people to come and go without being noticed, was served by a spaghetti-like mess of tunnels. I came up finally inside a subway fruit and bookstall, nodded to the proprietor—who seemed unsurprised—and swung the counter gate up and mingled with the crowd. It was not a route I had used before.

I caught the upriver jet express and got off at the first station. I crossed over to the downriver side, waited around the change window until a man came up who displayed quite a bit of money as he bought his counter. I got on the same train he did and got off when he did. At the first dark spot I rabbit-punched him. Now I had money and was ready to operate. I did not know quite why I had to have money, but I knew that I needed it for what I was about to do.

VII

Language grows, so they say, to describe experience of the race using it. Experience first—language second. How can I tell how I felt?

I saw things around me with a curious double vision, as if I stared at them through rippling water—yet I felt no surprise and no curiosity about this. I moved like a sleepwalker, unaware of what I was about to do—but I was wide-awake, fully aware of who I was, where I was, what my job at the Section had been. There was no amnesia; my full memories were available to me at any moment. And, although I did not know what I was about to do, I was always aware of what I was doing and sure that each act was the necessary, purposeful act at that moment.

They say that posthypnotic commands work something like that. I don't know; I am a poor hypnotic subject.

I felt no particular emotion most of the time, except the mild contentment that comes from being at work which needs to be done. That was up on the conscious level—and, I repeat, I was fully awake. Someplace, more levels down than I understand about, I was excruciatingly unhappy, terrified, and filled with guilt—but that was down, 'way down, locked, suppressed; I was hardly aware of it and in no practical way affected by it.

I knew that I had been seen to leave. That shout of "Sam!" had been intended for me; only two persons knew me by that name and the Old Man would have used my right name. So Mary had seen me leave—it was a good thing, I thought, that she had let me find out where her private apartment was. It would be necessary presently to boobytrap it against her next use of it. In the meantime I must get on with work and keep from being picked up.

I was in a warehouse district, moving through it cautiously, all my agent's training at work to avoid being conspicuous. Shortly I found what seemed to be a satisfactory building; there was a sign: LOFT FOR LEASE—SEE RENTAL AGENT ON GROUND FLOOR. I scouted it thoroughly, noted the address, then doubled back to the nearest Western Union booth two squares behind me. There I sat down at a vacant machine and sent the following message: EXPEDITE TWO CASES TINY TOTS TALKY TALES SAME DISCOUNT CONSIGNED TO JOEL FREEMAN and added the address of the empty loft. I sent it to Roscoe and Dillard, Jobbers and Manufacturers Agents, Des Moines, Iowa.

As I left the booth the sight of one of the Kwikfede chain of all-night restaurants reminded me that I was very hungry, but the reflex cut off at once and I thought no more about it. I returned to the warehouse building, found a dark corner in the rear, and settled quietly back to wait for dawn and business hours.

I must have slept; I have a dim recollection of ever repeating, claustrophobic nightmares.

From daylight until nine o'clock I hung around a hiring hall, studying the notices; it was the one place in the neighborhood where a man of no occupation would not attract attention. At nine o'clock I met the rental agent as he unlocked his office, and leased the loft, paying him a fat squeeze on the side for immediate possession while the paperwork went through on the deal. I went up to the loft, unlocked it, and waited.

About ten-thirty my crates were delivered. I let the teamsters leave; three were too many for me and I was not yet ready in any case. After they were gone, I opened one crate, took out one cell, warmed it, and got it ready. Then I went downstairs, found the rental agent again, and said, "Mr. Greenberg, could you come up for a moment? I want to see about making some changes in the lighting."

He fussed, but agreed to do so. When we entered the loft I closed the door behind us and led him over to the open crate. "Here," I said, "if you will just lean over there, you will see what I mean. If I could just—"

I got him around the neck with a grip that cut off his wind, ripped his jacket and shirt up, and, with my free hand, transferred a master from the cell to his bare back, then held him tight for a moment until his struggles stopped. Then I let him up, tucked his shirt back in and dusted him off. When he had recovered his breath, I said, "What news from Des Moines?"

"What do you want to know?" he asked. "How long have you been out?"

I started to explain, but he interrupted me with, "Let's have a direct conference and not waste time." I skinned up my shirt; he did the same; and we sat down on the edge of the unopened case, back to back, so that our masters could be in contact. My own mind was merely blank and I have no idea how long the conference went on. I watched a fly droning around a dusty cobweb, seeing it but not thinking about it.

The building superintendent was our next recruit. He was a large Swede and it took both of us to hold him. After that Mr. Greenberg called up the owner of the building and insisted that he simply had to come down and see some horrendous mishap that had occurred to the structure—just what, I don't know; I was busy with the super, opening and warming several more cells.

The owner of the building was a real prize and we all felt quiet satisfaction, including, of course, he himself. He belonged to the Constitution Club, the membership list of which read like the index of *Who's Who in Finance, Government, and Industry*. Better still, the club boasted the most famous chef in town; it was an even chance that any given member would be lunching there if he were in the city.

It was pushing noon; we had no time to lose. The super went out to buy suitable clothes and a satchel for me and sent the owner's chauffeur up to be recruited as he did so. At twelve-thirty we left, the owner and I, in his own car; the satchel contained twelve masters, still in their cells but ready.

The owner signed: *J. Hardwick Potter & Guest*. One of the flunkies tried to take my bag but I insisted that I needed it to change my shirt before lunch. We fiddled around in the washroom until we had it to ourselves, save for the attendant—whereupon we recruited him and sent him out with a message to the resident manager that a guest had taken ill in the washroom.

After we took care of the manager he obtained a white coat for me and I became another washroom attendant. I had only ten masters left but I knew that the cases would be picked up from the warehouse loft and delivered to the club shortly. The regular attendant and I used up the rest of those I had been able to bring before the lunch hour rush was over. One guest surprised us while we were busy and I had to kill him, as there was no time to save him for recruiting. We stuffed him into the mop closet.

There was a lull after that, as the cases had not yet arrived. Hunger reflex nearly doubled me over, then it dropped off sharply but still persisted; I told the manager, who had me served one of the best lunches I have ever eaten, in his office. The cases arrived just as I was finishing.

During the drowsy period that every gentlemen's club has in the midafternoon we secured the place. By four o'clock everyone present in the building—members, staff, and guests—were with us; from then on we simply processed them in the lobby as the doorman passed them in. Later in the day the manager phoned Des Moines for four more cases.

Our big prize came that evening—a guest, the Assistant Secretary of the Treasury. We saw a real victory in that; the Treasury Department is charged with the safety of the President.

VIII

The jubilation caused by the capture of a high key official was felt by me only as absentminded satisfaction, then I thought no more about it. We—the human recruits, I mean—hardly thought at all; we knew what we were to do each instant, but we knew it only at the moment of action, as a "high school" horse gets his orders, responds to them instantly, and is ready for the next signal from his rider.

High school horse and rider is a good comparison, as far as it goes—but it goes not nearly far enough. The horseman has partly at his disposal the intelligence of the horse; the masters had at their disposal not only our full intelligences, but also tapped directly our memory and experiences. We communicated for them between masters, too; sometimes we knew what we were talking about; sometimes we did not—such spoken words went through the servant, but the servant had no part in more important, direct, master-to-master conferences. During these we sat quietly and waited until our riders were through conferring, then rearranged our clothing to cover them up and did whatever was necessary. There was such a conference on a grand scale after the Assistant Secretary of the Treasury was recruited; I know no more of it than you do, although I sat in on it.

I had no more to do with words spoken by me for my master than had the audio relay buried behind my ear to do with words it sounded—the relay was silent all this time, incidentally; my phone proper I had left behind me. I, like it, was a communication instrument, nothing more. Some days after I was recruited I gave the club manager new instructions about how to order shipments of masters' carrying cells. I was fleetingly aware, as I did so, that three more ships had landed, but I was not aware of their locations; my overt knowledge was limited to a single address in New Orleans.

I thought nothing about it; I went on with my work. After the day spent at the club, I was a new "special assistant to Mr. Potter" and spent the days in his office—and the nights, too. Actually, the relationship may have reversed; I frequently gave oral instructions to Potter. Or perhaps I understand the social organization of the parasites as little now as I did then; the relationship may have been more flexible, more anarchistic, and vastly more subtle than I have the experience to imagine.

I knew—and my master certainly knew—that it was well for me to stay out of sight. Through me, my master knew as much of the organization we called the "Section" as I did; it knew that I was one human known to the Old Man to have been recruited—and my master knew, I am sure, that the Old Man would not cease to search for me, to recapture me or kill me.

It seems odd that it did not choose to change bodies and to kill mine; we had vastly more potential recruits available than we had masters. I do not think it could have felt anything parallel to human squeamishness; masters newly delivered from their transit cells frequently damaged their initial hosts; we always destroyed the damaged host and found a new one for the master.

Contrariwise, my master, by the time he chose me, had controlled not less than three human hosts—Jarvis, Miss Haines, and one of the girls in Barnes's office, probably the secretary—and in the course of it had no doubt acquired both sophistication and skill in the control of human hosts. It could have "changed horses" with ease.

On the other hand, would a skilled cowhand have destroyed a well-trained workhorse in favor of an untried, strange mount? That may have been why I was hidden and saved—or perhaps I don't know what I am talking about; what does a bee know about Beethoven?

After a time the city was "secured" and my master started taking me out on the streets. I do not mean to say that every inhabitant of the city wore a hump—no, not by more than 99 percent; the humans were very numerous and the masters still very few—but the key positions in the city were all held by our own recruits, from the cop on the comer to the mayor and the chief of police, not forgetting ward bosses, church ministers, board members, and any and all who were concerned with public communications and news. The vast majority continued with their usual affairs, not only undisturbed by the masquerade but unaware that anything had happened.

Unless, of course, one of them happened to be in the way of some purpose of a master—in which case he was disposed of to shut his mouth. This used up potential hosts but there was no need to be economical.

One of the disadvantages we worked under in serving our masters—or perhaps I should say one of the disadvantages our masters worked under—was the difficulty of long-distance communication. It was limited to what human hosts could say in human speech over ordinary communication channels, and was further limited, unless the channel was secured throughout, to conventionalized code messages such as the one I had sent ordering the first two shipments of masters. Oh, no doubt the masters could communicate ship-to-ship and probably ship-to-home-base, but there was no ship nearby; this city had been stormed as a prize-of-opportunity, as a direct result of my raid on Des Moines in my previous life.

Such communication through servants was almost certainly not adequate to the purposes of the masters; they seemed to need frequent direct body-to-body conference to coordinate their actions. I am no expert in exotic psychologies; some of those who are maintain that the parasites are not discrete individuals, but cells of a larger organism, in which case—but why go on? They seemed to need direct-contact conferences.

I was sent to New Orleans for such a conference.

I did not know I was going. I went out on the street as usual one morning, then went to the uptown launching platform and ordered a cab. Cabs were scarce; I thought about moving over to the other side and catching the public shuttle but the thought was immediately suppressed. After a considerable wait my cab was lifted to the loading ramp and I started to get in—I say "started to" as an old gentleman hustled up and climbed into it ahead of me.

I received an order to dispose of him, which order was immediately countermanded by one telling me to go slow and be careful, as if even the masters were not always sure of themselves. I said, "Excuse me, sir, but this cab is taken."

"Quite," the elderly man replied. "I've taken it." He was a picture of self-importance, from briefcase to dictatorial manner. He could easily have been a member of the Constitution Club, but he was not one of our own, as my master knew and told me.

"You will have to find another," I said reasonably. "Let's see your queue ticket." I had taken my ticket from the rack as soon as I reached the platform; the cab carried the launching number shown by my ticket.

I had him, but he did not stir. "Where are you going?" he demanded.

"New Orleans," I answered and learned for the first time my destination.

"Then you can drop me off in Memphis."

I shook my head. "It's out of my way."

"All of fifteen minutes!" He seemed to have difficulty controlling his temper, as if he were not often crossed. "You, sir, must know the rules about sharing cabs in these days of shortages. You cannot preempt a public vehicle unreasonably." He turned from me. "Driver! Explain to this person the rules."

The driver stopped picking his teeth just long enough to say, "It's nothing to me. I pick 'em up, I take 'em, I drop 'em. Settle it between yourselves or I'll ask the dispatcher for another fare."

I hesitated, not yet having been instructed. Then I found myself chucking my bag in and climbing inside. "New Orleans," I said, "with stop at Memphis." The driver shrugged and signaled the control tower. The other passenger snorted and paid me no further attention.

Once in the air he opened his briefcase and spread papers across his knees. I watched him with disinterest. Presently I found myself shifting my position to let me get at my gun easily. The elderly man shot out a hand and grabbed my wrist. "Not so fast, son," he said, and his features broke into the Satanic grin of the Old Man himself.

My reflexes are fast, but I was at the disadvantage of having everything routed from me to my master, passed on by it, and action routed back to me. How much delay is that? A millisecond? I don't know. As I was drawing, I felt the bell of a gun against my ribs. "Take it easy."

With his other hand he thrust something against my side; I felt a prick, and then through me spread the warm tingle of a jolt of "morpheus" taking hold. I've been knocked out by that drug twice before and I've given it more times than that; I knew what it was.

I made one more attempt to pull my gun free and sank forward.

I was vaguely aware of voices—voices which had been going on for some time before I got around to sorting them out as meaning. Someone was handling me roughly and someone was saying, "Watch out for that ape!" Another voice replied, "It's all right; his tendons are cut," to which the first voice retorted, "He's still got *teeth*, hasn't he?"

Yes, I thought fretfully, and if you get close enough I'll bite you with them, too. The remark about cut tendons seemed to be true; none of my limbs would move, but that did not worry me as much as being called an ape and not being able to resent it. It was a shame, I thought, to call a man names when he can't protect himself.

I wept a little and then fell into a stupor.

"Feeling better, son?"

The Old Man was leaning over the end of my bed, staring at me thoughtfully. His chest was bare and covered with grizzled hair; he showed a slight paunch.

"Unh," I said, "pretty good, I guess." I started to sit up and found I could not move.

The Old Man came around to the side of the bed. "We can take those restraints off now," he said, fiddling with clasps. "Didn't want you hurting yourself. There!"

I sat up, rubbing myself. I was quite stiff. "Now," said the Old Man, "how much do you remember? Report."

"Remember?"

"You were with them—remember? They caught you. Do you remember anything after the parasite got to you?"

I felt a sudden wild fear and clutched at the sides of the bed. "Boss! Boss—they know where this place is! *I told them.*"

"No, they don't," he answered quietly, "because these aren't the Section offices you remember. Once I was convinced that you had made a clean getaway, I had the old offices evacuated. They don't know about this hangout—I think. So you remember?"

"Of course I remember. I got out of here—I mean out of the old offices and went up—" My thoughts raced ahead of my words; I had a sudden full image of holding a live, moist master in my bare hand, ready to place it on the back of the rental agent.

I threw up on the sheet. The Old Man took a corner of it, wiped my mouth, and said gently, "Go ahead."

I swallowed and said, "Boss—they're all over the place! They've got the city."

"I know. Same as Des Moines. And Minneapolis, and St. Paul, and New Orleans, and Kansas City. Maybe more. I don't know—I can't be every place." He looked sour and added, "It's like fighting with your feet in a sack. We're losing, fast." He scowled and added, "We can't even clamp down on the cities we know about. It's very—"

"Good grief! Why not?"

"You should know. Because 'older and wiser heads' than mine are still to be convinced that there is a war on. Because when they take over a city, everything goes on as before."

I stared at him. "Never mind," he said gently. "You are the first break we've had. You're the first victim to be recaptured alive—and now we find you remember what happened to you. That's important. And your parasite is the first live one we've managed to capture and keep alive. We'll have a chance to—"

He broke off. My face must have been a mask of terror; the notion that my master was still alive—and might get to me again—was more than I could stand.

The Old Man took my arm and shook it. "Take it easy, son," he said mildly. "You are still pretty sick and pretty weak."

"*Where is it*?"

"Eh? The parasite? Don't worry about it. You can see it, if you wish; it's living off your opposite number, a red orangutan, name of Napoleon. It's safe."

"*Kill it*!"

"Hardly—we need it alive, for study."

I must have gone to pieces, for he slapped me a couple of times. "Take a brace," he said. "I hate to bother you when you are sick, but it's got to be done. We've got to get everything you remember down on wire. So level off and fly right."

I pulled myself together and started making a careful, detailed report of all that I could remember. I described renting the loft and recruiting my first victim, then how we moved on from there to the Constitution Club. The Old Man nodded. "Logical. You were a good agent, even for *them.* "

"You don't understand," I objected. "*I* didn't do any thinking. I knew what was going on, but that was all. It was as if, uh, as if—" I paused, stuck for words.

"Never mind. Get on with it."

"After we recruited the club manager the rest was easy. We took them as they came in and—"

"Names?"

"Oh, certainly. Myself, Greenberg—M. C. Greenberg, Thor Hansen, J. Hardwick Potter, his chauffeur Jim Wakeley, a little guy called 'Jake' who was washroom attendant at the club but I believe he had to be disposed of later—his master would not let him take time out for necessities. Then there was the manager; I never did get his name." I paused, letting my mind run back over that busy afternoon and evening in the club, trying to make sure of each recruit. "Oh my God!"

"What is it?"

"The Secretary—The Assistant Secretary of the *Treasury*."

"You mean you got *him*?"

"Yes. The first day. What day was that? How long has it been? God, chief, the Treasury Department *protect the President*!"

But I was not talking to anyone; there was just a hole in the air where the Old Man had been.

I lay back exhausted. I started sobbing softly into my pillow. After a while I went to sleep.

IX

I woke up with my mouth foul, my head buzzing, and a vague sense of impending disaster. Nevertheless I felt fine, by comparison. A cheerful voice said, "Feeling better?"

A small brunet creature was bending over me. She was as cute a little bug as I have ever seen and I was well enough to appreciate the fact, however faintly. She was dressed in a very odd costume, what there was of it—skintight white shorts, a wisp of practically transparent stuff that restrained her breasts, but not much, and a sort of metal carapace that covered the back of her neck, her shoulders, and went on down her spine.

"Better," I admitted, then made a wry face.

"Mouth taste unpleasant?"

"Like a Balkan cabinet meeting."

"Here." She gave me some stuff in a glass; it was spicy and burned a little, and it washed away the bad taste at once. "No," she went on, "don't swallow it. Spit it out like a little man and I'll get you some water." I obeyed.

"I'm Doris Marsden," she went on, "your day nurse."

"Glad to know you, Doris," I answered and stared at her with increasing appreciation. "Say—why the get up? Not that I don't like it, but you look like a refugee from a comic book."

She looked down at herself and giggled. "I feel like a chorus girl. But you'll get used to it—I did."

"I'm already used to it. I like it fine. But why?"

"The Old Man's orders."

I started to ask why again, then I knew why, and I started feeling worse again. I shut up. Doris went on, "Now for some supper." She got a tray and sat down on my bed.

"I don't believe I want anything to eat."

"Open up," she said firmly, "or I'll rub it in your hair. There! That's a good boy."

Between gulps, taken in self-defense, I managed to get out, "I feel pretty good. Give me one jolt of 'gyro' and I'll be back on my feet."

"No stimulants for you," she said flatly, still shoveling it in. "Special diet and lots of rest, with maybe a sleepy pill later. That's what the man says."

"What's wrong with me?"

"Extreme exhaustion, starvation, and the first case of scurvy I ever saw in all my born days. As well as scabies and lice—but we got those whipped. There, now you know—and if you tell the doctor I told you, I'll call you a liar to your face. Turn over on your tummy."

I did so and she started changing dressings. I appeared to be spotted with sores; the stuff she used stung a bit, then felt cool. I thought about what she had told me and tried to remember just how I had lived under my master.

"Stop trembling," she said. "Are you having a bad one?"

"I'm all right," I told her. I did manage to stop shaking and to think it over calmly. As near as I could remember I had not eaten during that period oftener than every second or third day. Bathing? Let me see—why, I hadn't bathed at all! I had shaved every day and put on a clean shirt; that was a necessary part of the masquerade and the master knew it.

On the other hand, so far as I could remember, I had never taken off my shoes from the time I had stolen them until the Old Man had recaptured me—and they had been too tight to start with. "What sort of shape are my feet in?" I asked.

"Don't be nosy," Doris advised me. "Now turn over on your back."

I like nurses; they are calm and earthy and very tolerant. Miss Briggs, my night nurse, was not the mouthwatering job that Doris was; she had a face like a jaundiced horse—but she had a fine figure for a woman her age, hard and well cared for. She wore the same sort of musical-comedy rig that Doris sported, but she wore it with a no-nonsense air and walked like a grenadier guard. Doris, bless her heart, jiggled pleasantly as she walked.

Miss Briggs refused to give me a second sleeping pill when I woke up in the night and had the horrors, but she did play poker with me and skinned me out of half a month's pay. I tried to find out from her about the President matter, for I figured the Old Man had either won or lost by that time. But she wasn't talking. She would not admit that she knew anything about parasites, flying saucers, or what not—and she herself sitting there dressed in a costume that could have only one purpose!

I asked her what the public news was, then? She maintained that she had been too busy lately to look at a 'cast. So I asked to have a stereo box moved into my room, so I could catch a newscast. She said I would have to ask the doctor about that; I was on the 'quiet' list. I asked when in the deuce I was going to see this so-called doctor? She said she didn't know; the doctor had been very busy lately. I asked how many other patients there were in the infirmary anyway? She said she really didn't remember. About then her call bell sounded and she left, presumably to see another patient.

I fixed her. While she was gone, I cold-decked the next deal, so that she got a pat hand—then I wouldn't bet against her.

I got to sleep later on and was awakened by Miss Briggs slapping me in the face with a cold, wet washcloth. She got me ready for breakfast, then Doris relieved her and brought it to me. This time I fed myself and while I was chomping I tackled her for news—with the same perfect score I had made with Miss Briggs. Nurses run a hospital as if it were a nursery for backward children.

Davidson came around to see me after breakfast. "Heard you were here," he said. He was wearing shorts and nothing else, except that his left arm was covered by a dressing.

"More than I've heard," I complained. "What happened to you?"

"Bee stung me."

I dropped that subject; if he didn't want to tell how he had gotten burned, that was his business. I went on, "The Old Man was in here yesterday, getting my report, when he left very suddenly. Seen him since?"

"Yep."

"Well?" I answered.

"Well, how about *you*? Are you straightened out? Have the psych boys cleared you for classified matters, or not?"

"Is there any doubt about it?"

"You're darn tootin' there's doubt. Poor old Jarvis never did pull out of it."

"Huh?" I hadn't thought about Jarvis. "How is he now?"

"He isn't. Never did get right in his head. Dropped into a coma and died the next day—the day after you left. I mean the day after you were captured. No apparent reason—just died." Davidson looked me over. "You must be tough."

I did not feel tough. I felt tears of weakness welling up again and I blinked them back. Davidson pretended not to see and went on conversationally, "You should have seen the ruckus after you gave us the slip. The Old Man took out after you wearing nothing but a gun and a look of grim determination. He would have caught you, too, my money says—but the civil police picked him up and we had to get him out of hock." Davidson grinned.

I grinned feebly myself. There was something both gallant and silly about the Old Man charging out to save the world singlehanded dressed in his birthday suit. "Sorry I missed it. But what else has happened—lately?"

Davidson looked me over carefully, then said, "Wait a minute." He stepped out of the room and was gone a short time. When he came back, he said, "The Old Man says it's all right. What do you want to know?"

"Everything! What happened yesterday?"

"I was in on that one," he answered, "That's how I got this." He waved his damaged wing at me, "I was lucky," he added, "three agents were killed. Quite a fracas."

"But how did it come out? How about the President? Was he—"

Doris hustled into the room. "Oh, there you are!" she said to

Davidson. "I told you to stay in bed. You're due in prosthetics at Mercy Hospital right now. The ambulance has been waiting for ten minutes."

He stood up, grinned at her, and pinched her cheek with his good hand. "The party can't start until I get there."

"Well, hurry!"

"Coming." He started out the door with her.

I called out, "Hey! How about the *President*?"

Davidson paused and looked back over his shoulder. "Oh, him? He's all right—not a scratch on him." He went on.

Doris came back a few minutes later, fuming. "Patients!" she said, like a swear word. "Do you know why they call them 'patients'? Because it's patience you have to have to put up with them. I should have had at least twenty minutes for his injection to take hold; as it was I gave it to him when he got into the ambulance."

"Injection for what?"

"Didn't he tell you?"

"No."

"Well . . . no reason not to tell you. Amputation and graft, lower left arm."

"Oh." Well, I thought, I won't hear the end of the story from Davidson; grafting on a new limb is a shock. They usually keep the patient hopped up for at least ten days. I wondered about the Old Man: had he come out of it alive? Of course he had, I reminded myself; Davidson checked with him before he talked.

But that didn't mean he hadn't been wounded. I tackled Doris again. "How about the Old Man? Is he on the sick list? Or would it be a violation of your sacred run-around rules to tell me?"

"You talk too much," she answered. "It's time for your morning nourishment and your nap." She produced a glass of milky slop, magician fashion.

"Speak up, wench, or I'll spit it back in your face."

"The Old Man? You mean the Chief of Section?"

"Who else?"

"*He's* not on the sick list, at least not here." She shivered and made a face. "I wouldn't want *him* as a patient."

I was inclined to agree with her.

X

For two or three more days I was kept wrapped in swaddling clothing and treated like a child. I did not care; it was the first real rest I had had in years. Probably they were slipping me sedatives; I noticed that I was always ready to sleep each time after they fed me. The sores got much better and presently I was encouraged—"required" I should say—by Doris to take light exercise around the room.

The Old Man called on me. "Well," he said, "still malingering, I see."

I flushed. "Damn your black, flabby heart," I told him. "Get me a pair of pants and I'll show you who is malingering."

"Slow down, slow down." He took my chart from the foot of my bed and looked it over. "Nurse," he said, "get this man a pair of shorts. I'm restoring him to duty."

Doris faced up to him like a banty hen. "Now see here," she said, "you may be the big boss, but you can't give orders here. The doctor will—"

"Stow it!" he said, "and get those drawers. When the doctor comes in, send him to me."

"But—"

He picked her up, swung her around, paddled her behind, and said, "Git!"

She went out, squawking and sputtering, and came back shortly, not with clothes for me, but with the doctor. The Old Man looked around and said mildly, "Doc, I sent for pants, not for you."

The medico said stiffly, "I'll thank you not to interfere with my patients."

"He's not your patient. I need him, so I am restoring him to duty."

"Yes? Sir, if you do not like the way I run my department, you may have my resignation at once."

The Old Man is stubborn but not bullheaded. He answered, "I beg your pardon, sir. Sometimes I become too preoccupied with other problems to remember to follow correct procedure. Will you do me the favor of examining this patient? I need him; if he can possibly be restored to duty, it would help me to have his services at once."

The doctor's jaw muscles were jumping, but all he said was, "Certainly, sir!" He went through a show of studying my chart, then had me sit on the bed while he tested my reflexes. Personally, I thought they were mushy. He peeled back my eyelids, flashed a light in my eye, and said, "He needs more recuperation time—but you may have him. Nurse—fetch clothing for this man."

Clothing consisted of shorts and shoes; I had been better dressed in a hospital gown. But everybody else was dressed the same way, and it was downright comforting to see all those bare shoulders with no masters clinging to them. I told the Old Man so. "Best defense we've got," he growled, "even if it does make the joint look like a ruddy summer colony. If we don't win this set-to before winter weather, we're licked."

The Old Man stopped at a door with a freshly lettered sign: BIOLOGICAL LABORATORY—STAY OUT! He dilated the door.

I hung back. "Where are we going?"

"Going to take a look at your twin brother, the ape with your parasite."

"That's what I thought. Not for me—no point in it. No, thanks!" I could feel myself begin to tremble.

The Old Man paused. "Now, look, son," he said patiently, "you've got to get over your panic. The best way is to face up to it. I know it's hard—I've spent a good many hours in here myself, just staring at the thing, getting used to it."

"You don't know—you *can't* know!" I had the shakes so badly now that I had to steady myself by the doorframe.

He looked at me. "I suppose it's different," he said slowly, "when you've actually had it. Jarvis—" He broke off.

"You're darn right it's different! You're not going to get *me* in *there*!"

"No, I guess not. Well, the doctor was right. Go on back, son, and turn yourself in at the infirmary." His tones were regretful rather than angry. He turned and started into the laboratory.

He had gotten three or four steps away before I called out, "Boss!"

He stopped and turned, his face expressionless. "Wait," I added, "I'm coming."

"You don't have to."

"I know. I'll do it. It—It just takes . . . a while—to get your nerve back."

He did not answer but, as I came alongside him, he grasped my upper arm, warmly and affectionately, and continued to hold it as we walked, as if I were a girl. We went on in, through another locked door and into a room that was conditioned warm and moist. The ape was there, caged.

He sat facing us, his torso supported and restrained by a strap-metal framework. His arms and legs hung limply, as if he had no control over them—which he did not have, as I learned.

As we came in he looked up and at us. For an instant his eyes were malevolent and intelligent; then the fire died out and they were merely the eyes of a dumb brute, a brute in pain.

"Around to the side," the Old Man said softly. I would have hung back but he still had me by the arm. We moved around; the ape followed us with his eyes, but his body was held by the frame. From the new position I could see—it.

My master. The thing that had ridden my back for an endless time, spoken with my mouth—thought with my brain. My master.

"Steady," the Old Man said softly. "Steady. You'll get used to it." He shook my arm. "Look away for a bit. It helps."

I did so and it did help. Not much, but some. I took a couple of deep breaths, then held it and managed to slow my heart down a little. I made myself stare at it.

It is not the appearance of a parasite which arouses horror. True, they are disgustingly ugly, but not more so than slime in a pond—not as much so as maggots in garbage.

Nor was the horror entirely from knowing what they could do—for I felt the horror the first time I saw one, before I really knew what one was. I tried to tell the Old Man about it, letting the talk steady me. He nodded, his eyes still on the parasite. "It's the same with everybody," he said. "Unreasoned fear, like a bird with a snake. Probably its prime weapon." He let his own eyes drift away, as if too long a sight of it were too much even for his rawhide nerves.

I stuck with him, trying to get used to it and gulping at my breakfast but not losing it. I kept telling myself that I was safe from it, that it couldn't harm *me*.

I looked away again and found the Old Man's eyes on me. "How about it?" he said. "Getting hardened to it?"

I looked back at it. "A little." I went on savagely, "All I want to do is to kill it! I want to kill all of them—I could spend my whole life killing them and killing them." I began to shake again.

The Old Man continued to study me. "Here," he said, and handed me his gun.

It startled me. I was unarmed myself, having come straight from bed. I took it but looked back at him questioningly. "Huh? What for?"

"You want to kill it, don't you? If you feel that you have to—go ahead. Kill it. Right now."

"Huh? But—Look here, boss, you told me you needed this one for study."

"I do. But if you need to kill it, if you feel that you have to kill it, do so. I figure this particular one is your baby; you're entitled to it. If you need to kill it, to make you a whole man again, go ahead."

" 'To make me a whole man again—' " The thought rang through my head. The Old Man knew, better than I knew, what was wrong with me, what medicine it would take to cure me. I was no longer trembling; I stood there, the gun cradled in my hand, ready to spit and kill. My master . . .

If I killed *this* one I would be a free man again—but I would never be free as long as *it* lived. Surely, I wanted to kill them, every one of them, search them out, burn them, kill them—but this one above all.

My master . . . still my master unless I killed it. I had a dark and certain thought that if I were alone with it, I would be able to do nothing, that I would freeze and wait while it crawled up me and settled again between my shoulder blades, searched out my spinal column, took possession of my brain and my very inner self.

But now I could kill it!

No longer frightened but fiercely exultant I raised the gun, ready to squeeze the trigger.

The Old Man watched me.

I lowered the gun a little and said uncertainly, "Boss, suppose I do kill it. You've got others?"

"No."

"But you need it."

"Yes."

"Well, but—For the love o' God, why did you give me the gun?"

"You know why. This one is yours; you've got first claim. If you have to kill it, go ahead. If you can pass it up, then the Section will use it."

I had to kill it. Even if we killed all the others, while this one was still alive I would still crouch and tremble in the dark. As for the others, for study—why, we could capture a dozen any time at the Constitution Club. With this one dead I'd lead the raid myself. Breathing rapidly, I raised the gun again.

Then I turned and chucked the gun to the Old Man; he plucked it out of the air and put it away. "What happened?" he asked. "You were all set."

"Uh? I don't know. When it got right down to it, it was enough to know that I could."

"I figured that it would be."

I felt warm and relaxed, as if I had just killed a man or had a woman—as if I had just killed *it*. I was able to turn my back on it and face the Old Man. I was not even angry with him for what he had done; instead I felt warm toward him, even affectionate. "I know you did, damn you. How does it feel to be a puppet master?"

He did not take the jibe as a joke. Instead he answered soberly, "Not me. The most I ever do is to lead a man on the path he wants to follow. *There* is the puppet master." He hooked a thumb at the parasite.

I looked around at it. "Yes," I agreed softly, " 'the puppet master'. You think you know what you mean by that—but you don't. And boss . . . I hope you never do."

"I hope so, too," he answered seriously.

I could look now without trembling. I even started to put my hands in my pockets, but the shorts had no pockets. Still staring at it, I went on, "Boss, when you are through with it, if there is anything left, then I'll kill it."

"That's a promise."

We were interrupted by a man bustling into the cage room. He was dressed in shorts and a lab coat; it made him look silly. I did not recognize him—it was not Graves; I never saw Graves again; I imagine the Old Man ate him for lunch.

"Chief," he said, trotting up, "I did not know you were in here. I—"

"Well, I am," the Old Man cut in. "What are you doing wearing a coat?" The Old Man's gun was out and pointed at the man's chest.

The man stared at the gun as if it were a bad joke. "Why, I was working, of course. There is always a chance of splattering one's self. Some of our solutions are rather—"

"Take it off!"

"Eh?"

The Old Man waggled his gun at him. To me he said, "Get ready to take him."

The man took his coat off. He stood there holding it and biting his lip. His back and shoulders were bare, nor was there the telltale rash. "Take that damned coat and burn it," the Old Man told him. "Then get back to your work."

The man hurried away, his face red, then hesitated, glanced at me, and said to the Old Man, "Chief, are you ready for that, uh, procedure?"

"Shortly. I'll let you know."

The man opened his mouth, closed it, and left. The Old Man wearily put his gun away. "Post an order," he muttered. "Read it aloud. Make everybody sign for it—tattoo it on their narrow little chests—and some smart Aleck thinks it doesn't apply to him. Scientists!" He said the last word in the way in which Doris had said, "Patients!"

I turned back to looking at my former master. It still revolted me, but there was a gusty feeling of danger, too, that was not totally unpleasant—like standing on a very high place. "Boss," I asked, "what are you going to do with this thing?"

He looked at me, rather than at the slug. "I plan to interview it."

"To what? But how can you— What I want to say is: the ape, I mean—"

"No, the ape can't talk. That's the hitch. We'll have to have a volunteer—a human volunteer."

When his words sank in and I began to visualize what he meant by them the horror struck me again almost full force. "You can't mean that. You wouldn't do that—not to anybody."

"I could and I'm going to. What needs to be done will be done."

"You won't get any volunteers!"

"I've already got one."

"You have? Who?"

"But I don't want to use the volunteer I've got. I'm still looking for the right man."

I was disgusted and showed it. "You ought not to be looking for anyone, volunteer or not. And if you've got one, I'll bet you won't find another; there can't be two people that far out of their minds."

"Possibly," he agreed. "But I still don't want the one I've got. The interview is a necessity, son; we are fighting a war with a total lack of military intelligence. We don't know anything, really, about our enemy. We can't negotiate with him, we don't know where he comes from, nor what makes him tick. We've got to find out; our racial existence depends on it. The only—the *only* way to talk to these critters is through a human volunteer. So it will be done. But I'm still looking for a volunteer."

"Well, don't look at me!"

"I *am* looking at you."

My answer had been half wisecrack; his answer turned it dead serious and startled me speechless. I finally managed to splutter, "You're crazy! I should have killed it when I had your gun—and I would have if I had known what you wanted it for. But as for me volunteering to let you put that thing—No! I've had it."

He ploughed on through as if he had not heard me. "It can't be just any volunteer; it has to be a man who can take it. Jarvis wasn't stable enough, nor tough enough in some fashion to stand up under it. We know you are."

"Me? You don't know anything of the sort. All you know is that I lived through it once. I . . . I couldn't *stand* it again."

"Well, maybe it will kill you," he answered calmly, "but it is less likely to kill you than someone else. You are proved and salted; you ought to be able to do it standing on your head. With anyone else I run more risk of losing an agent."

"Since when did you worry about risking an agent?" I said bitterly.

"Since always, believe me. I am giving you one more chance, son: are you going to do this, knowing that it has to be done and that you stand the best chance of anybody—and can be of most use to us, because you *are* used to it—or are you going to let some other agent risk his reason and probably his life in your place?"

I started to try to explain how I felt, that I was not afraid to die, no more than is normal, but that I could not stand the thought of dying while possessed by a parasite. Somehow I felt that to die so would be to die already consigned to an endless and unbearable hell. Even worse was the prospect of *not* dying once the slug touched me. But I could not say it; there were still no words to describe what the race had not experienced.

I shrugged. "You can have my appointment back. There is a limit to what one man can be expected to go through and I've reached it. I won't do it."

He turned to the intercom phone on the wall. "Laboratory," he called out, "we'll start the experiment right now. Hurry it up!"

The answering voice I recognized as that of the man who had walked in on us. "Which subject?" he asked. "It affects the measurements."

"The original volunteer."

"That's the smaller rig?" the voice asked doubtfully.

"Right. Get it in here."

I started for the door. The Old Man snapped, "Where do you think you are going?"

"Out," I snapped back. "I'm having no part of this."

He grabbed me and spun me around as if he had been the bigger and younger. "No, you don't. You know more about these things than the rest of us; your advice could be of help."

"Let go of me."

"You'll stay and watch!" he said savagely, "strapped down or free to move, as you choose. I've made allowance for your illness but I've had enough of your nonsense."

I was too weary to buck him; I felt nervously exhausted, tired in my bones. "You're the boss."

The lab people wheeled in a metal framework, a sort of chair, more like a Sing Sing special than anything else. There were metal clamps for ankles and knees, more of the same on the chair arms for the wrists and elbows. There was a corselet effect to restrain the waist and the lower part of the chest, but the back was cut away so that the shoulders of the person unfortunate enough to sit in it would be free.

They brought it over and placed it beside the ape's cage, then removed the back panel of the cage and the panel on the side nearest the "chair" rig.

The ape watched the procedure with intent, aware eyes, but his limbs still dangled helplessly. Nevertheless, I became still more disturbed at the cage being thus opened. Only the Old Man's threat of placing me under restraint kept me from leaving.

The technicians stood back and waited, apparently ready for the job. The outer door opened and several people came in; among them was Mary.

I was caught off balance by her sudden appearance; I had been wanting to see her and had tried several times to get word to her through the nurses—but they either honestly could not identify her or had received instructions. Now I saw her first under these circumstances. I cursed the Old Man to myself, knowing it was useless to object. It was no sort of a show to bring a woman to, even if the woman was an agent. There ought to be some sort of decent limits somewhere.

Mary saw me, looked surprised, and nodded. I let it go with a nod myself; it was no time for small talk. She was looking good, as always, though very sober. She was dressed in the same sort of costume as the nurses had worn, shorts and a skimpy halter, but she did not have on the ludicrous metal helmet and back plate.

The others in the party were men. They wore shorts, like the Old Man and myself. They were loaded with recording and stereo equipment as well as other apparatus.

"Ready?" inquired the lab chief.

"Get going," answered the Old Man.

Mary walked straight to the metal chair and sat down in it. Two of the technicians knelt at her feet and started busying themselves with the clamps. Mary reached behind her, unfastened her halter and let it fall, leaving her back bare.

I looked at this in a frozen daze, as if caught in a nightmare. Then I had grabbed the Old Man by the shoulders and had literally thrown him aside and I was standing by the chair, kicking the technicians out of the way. "Mary!" I screamed, "get up out of there!"

Now the Old Man had his gun on me and was motioning me back with it. "Away from her," he ordered. "You three—grab him and tie him up."

I looked at the gun, then I looked down at Mary. She said nothing and did not move; in fact her feet were already bound. She simply looked at me with compassionate eyes. "Get up from there, Mary," I said dully, "I want to sit down."

They removed the chair Mary had sat in and brought in another, larger one. I could not have used hers; both of them were tailored to size. When they finished clamping me in place I might as well have been cast into concrete. Once secured, my back began to itch unbearably, although nothing, as yet, had touched it.

Mary was no longer in the room; whether she had left or had been ordered out by the Old Man I do not know and it did not seem to matter. The Old Man stepped up to me after I had been prepared, laid a hand on my arm, and said quietly, "Thanks, son."

I did not bother to answer.

I did not see them handle the parasite as it took place behind my back. There was a rig which I had seen them bring in which appeared to be modified from the remote-handling gear used on radioactives; no doubt they used that. I was not interested enough to look, even if I had been able to turn my head far enough, which I couldn't.

Once the ape barked and screamed and someone shouted, "Watch it!"

There was a dead silence as if everyone was holding his breath—then something moist touched the back of my neck and I fainted.

I came out of it with the same tingling energy I had experienced once before. I knew I was in a tight spot, but I was warily determined to think my way out of it. I was not afraid; I was contemptuous of those around me and sure that in the long run I could outwit them.

The Old Man said sharply, "Can you hear me?"

I answered, "Of course I can. Quit shouting."

"Do you remember what we are here for?"

I said, "Naturally I remember. You want to ask some questions. What are you waiting for?"

"*What are you*?"

"Now that's a silly question. Take a look at me. I'm six feet one, more muscle than brain, and I weigh—"

"Not you. You know to whom I am talking—*you*."

"Guessing games?"

The Old Man waited a bit before replying, "It will do you no good to pretend that I don't know what you are—"

"Ah, but you don't."

"Or, rather, that I don't know that you are a parasite talking through the body of a man. You know that I have been studying you all the time you have been living on the body of that ape. I know things about you which give me an advantage over you. One—" He started ticking them off.

"You can be killed.

"Two, you can be hurt. You don't like electric shock and you can't stand the amount of heat even a man can stand.

"Three, you are helpless without your host. I could have you removed from this man and you would die.

"Four, you have no powers except those you borrow from your host—and your host is helpless. Try your bonds; then be sensible. You must cooperate—or die."

I listened with half an ear; I had already been trying my bonds, neither hoping nor fearing, but finding them, as I expected, impossible to escape. This did not worry me; I had neither worries nor fears. I was oddly contented to be back with my master, to be free of troubles and tensions. My business was to serve and the future would take care of itself.

In the meantime I must be alert, ready to serve him.

One ankle strap seemed less tight than the other; possibly I might drag my foot through it. I checked on the arm clamps; perhaps if I relaxed my muscles completely—

But I made no effort to escape. An instruction came at once—or, I made a decision, for the words mean the same; I tell you there was no conflict between my master and me; we were one—instruction or decision, I knew it was not time to risk an escape. I ran my eyes around the room, trying to figure who was armed and who was not. It was my guess that only the Old Man was armed; that bettered the chances.

Somewhere, deep down, was that dull ache of guilt and despair never experienced by any but the servants of the masters—but I was much too busy with the problem at hand to be troubled by it.

"Well?" the Old Man went on. "Do you answer my questions, or do I punish you?"

"What questions?" I asked. "Up to now, you've been talking nonsense."

The Old Man turned to one of the technicians. "Give me the tickler."

I felt no apprehension although I did not understand what it was he had asked for. I was still busy checking my bonds. If I could tempt him into placing his gun within my reach—assuming that I could get one arm free—then I might be able to—

He reached past my shoulders with a rod. I felt a shocking, unbearable pain. The room blacked out as if a switch had been thrown and for an undying instant I was jolted and twisted by hurt. I was split apart by it; for the moment I was masterless.

The pain left, leaving only its searing memory behind. Before I could speak, or even think coherently for myself, the splitting away had ended and I was again safe in the arms of my master. But for the first and only time in my service to him I was not myself free of worry; some of his own wild fear and pain was passed on to me, the servant.

I looked down and saw a line of red welling out of my left wrist; in my struggles I had cut myself on the clamp. It did not matter; I would tear off hands and feet and escape from there on bloody stumps, if escape for my master were possible that way.

"Well," asked the Old Man, "how did you like the taste of that?"

The panic that possessed me washed away; I was again filled with an unworried sense of well being, albeit wary and watchful. My wrists and ankles, which had begun to pain me, stopped hurting. "Why did you do that?" I asked. "Certainly, you can hurt me—but why?"

"Answer my questions."

"Ask them."

"*What are you*?"

The answer did not come at once. The Old Man reached for the rod; I heard myself saying, "We are the people."

"The people? What people?"

"The only people. We have studied you and we know your ways.

We—" I stopped suddenly.

"Keep talking," the Old Man said grimly, and gestured with the rod.

"We come," I went on, "to bring you—"

"To bring us what?"

I wanted to talk; the rod was terrifyingly close. But there was some difficulty with words. "To bring you peace," I blurted out.

The Old Man snorted.

" 'Peace'," I went on, "and contentment—and the joy of—of surrender." I hesitated again; "surrender" was not the right word. I struggled with it the way one struggles with a poorly grasped foreign language. "The joy," I repeated, "—the joy of . . . *nirvana*." That was it; the word fitted. I felt like a dog being patted for fetching a stick; I wriggled with pleasure.

"Let me get this," the Old Man said thoughtfully. "You are promising the human race that, if we will just surrender to your kind, you will take care of us and make us happy. Right?"

"Exactly!"

The Old Man studied me for a long moment, looking, not at my face, but past my shoulders. He spat upon the floor. "You know," he said slowly, "me and my kind, we have often been offered that bargain, though maybe not on such a grand scale. It never worked out worth a damn."

I leaned forward as much as the rig would allow. "Try it yourself," I suggested. "It can be done quickly—and then you will *know*."

He stared at me, this time in my face. "Maybe I should," he said thoughtfully. "Maybe I owe it to—somebody, to try it. And maybe I will, someday. But right now," he went on briskly, "you have more questions to answer. Answer them quick and proper and stay healthy. Be slow about it and I'll step up the current." He brandished the rod.

I shrank back, feeling dismay and defeat. For a moment I had thought he was going to accept the offer and I had been planning the possibilities of escape that could develop. "Now," he went on, "where do you come from?"

No answer . . . I felt no urge to answer.

The rod came closer. "Far away!" I burst out.

"That's not news. Tell me where? Where's your home base, your own planet?"

I had no answer. The Old Man waited a moment, then said, "I see I'll have to touch up your memory." I watched dully, thinking nothing at all. He was interrupted by one of the bystanders. "Eh?" said the Old Man.

"There may be a semantic difficulty," the other repeated. "Different astronomical concepts."

"Why should there be?" asked the Old Man. "That slug is using borrowed language throughout. He knows what his host knows; we've proved that." Nevertheless he turned back and started a different tack. "See here—you savvy the solar system; is your planet inside it or outside it?"

I hesitated, then answered, "All planets are ours."

The Old Man pulled at his lip. "I wonder," he mused, "just what you mean by that?" He went on, "Never mind; you can claim the whole damned universe; I want to know where your nest is? Where is your home base? Where do your ships come from?"

I could not have told him and did not; I sat silent.

Before I could anticipate it he reached behind me with the rod; I felt one smashing blow of pain, then it was gone. "Now, talk, damn you! What planet? Mars? Venus? Jupiter? Saturn? Uranus? Neptune? Pluto? Kalki?" As he ticked them off, I saw them—and I have never been as far off Earth as the space stations. When he came to the right one, I knew—and the thought was instantly snatched from me.

"Speak up," he went on, "or feel the whip."

I heard myself saying, "None of them. Our home is much farther away. You could never find it."

He looked past my shoulders and then into my eyes. "I think you are lying. I think you need some juice to keep you honest."

"No, no!"

"No harm to try." Slowly he thrust the rod past me, behind me. I knew the answer again and was about to give it, when something grabbed my throat. Then the pain started.

It did not stop. I was being torn apart; I tried to talk, to tell, anything to stop the pain—but the hand still clutched my throat and I could not.

Through a clearing blur of pain I saw the Old Man's face, shimmering and floating. "Had enough?" he asked. "Ready to talk?" I started to answer, but I choked and gagged. I saw him reach out again with the rod.

I burst into pieces and died.

They were leaning over me. Someone said, "He's coming around. Watch him; he might be violent."

The Old Man's face was over mine, his expression worried. "Are you all right, son?" he asked anxiously. I turned my face away.

"One side, please," another voice said. "Let me give him the injection."

"Will his heart stand it?"

"Certainly—or I wouldn't give it to him." The speaker knelt by me, took my arm, and gave me a shot. He stood up, looked at his hands, then wiped them on his shorts; they left bloody streaks.

I felt strength flowing back into me. "Gyro", I thought absently, or something like it. Whatever it was, it was pulling me back together. Shortly I sat up, unassisted.

I was still in the cage room, directly in front of that damnable chair. The cage, I noticed without interest, was closed again. I started to get to my feet; the Old Man stepped forward and gave me a hand. I shook him off. "Don't touch me!"

"Sorry," he answered, then snapped, "Jones! You and Ito—get the litter. Take him back to the infirmary. Doc, you go along."

"Certainly." The man who had given me the shot stepped forward and started to take my arm. I drew away from him.

"Keep your hands off me!"

He stopped. "Get away from me—all of you. Just leave me alone." The doctor looked at the Old Man, who shrugged, then motioned them all back. Alone, I went to the door, through it, and on out through the outer door into the passageway.

I paused there, looked at my wrists and ankles and decided that I might as well go back to the infirmary. Doris would take care of me, I was sure, and then maybe I could sleep. I felt as if I had gone fifteen rounds and lost every one of them.

"Sam, Sam!"

I looked up; I knew that voice. Mary hurried up and was standing before me, looking at me with great sorrowful eyes. "I've been waiting," she said. "Oh, Sam! What have they done to you?" Her voice was so choked that I could hardly understand her.

"You should know," I answered, and found I had strength enough left to slap her.

"Bitch," I added.

The room I had had was still empty, but I did not find Doris. I was aware that I had been followed, probably by the doctor, but I wanted no part of him nor any of them just then; I closed the door. Then I lay face down on the bed and tried to stop thinking or feeling anything.

Presently I heard a gasp, and opened one eye; there was Doris. "What in the world?" she exclaimed and came over to me. I felt her gentle hands on me. "Why, you poor, poor baby!" Then she added, "Just stay there, don't try to move. I'll get the doctor."

"No!"

"But you've got to have the doctor."

"No. I won't see him. You help me."

She did not answer. Presently I heard her go out. She came back shortly—I think it was shortly—and started to bathe my wounds. The doctor was not with her.

She was not more than half my size but she lifted me and turned me when she needed to as if I had been the baby she had called me. I was not surprised by it; I knew she could take care of me.

I wanted to scream when she touched my back. But she dressed it quickly and said, "Over easy, now."

"I'll stay face down."

"No," she denied, "I want you to drink something, that's a good boy."

I turned over, with her doing most of the work, and drank what she gave me. After a bit I went to sleep.

I seem to remember being awakened later, seeing the Old Man and cursing him out. The doctor was there too—or it could just as well have been a dream.

Miss Briggs woke me up and Doris brought me breakfast; it was as if I had never been off the sick list. Doris wanted to feed me but I was well able to do it myself. Actually I was not in too bad shape. I was stiff and sore and felt as if I had gone over Niagara Falls in a barrel; there were dressings on both arms and both legs where I had cut myself on the clamps, but no bones were broken. Where I was sick was in my soul.

Don't misunderstand me. The Old Man could send me into a dangerous spot—and had done so, more than once—and I would not hold it against him. That I had signed up for. But I had not signed up for what he had done to me. He knew what made me tick and he had deliberately used it to force me into something I would never have agreed to, had I not been jockeyed into it. Then after he had gotten me where he wanted me, he had used me unmercifully.

Oh, I've slapped men around to make them talk. Sometimes you have to. But this was different. Believe me.

It was the Old Man that really hurt. Mary? After all, what was she? Just another babe. True, I was disgusted with her to the bottom of my soul for letting the Old Man talk her into being used as bait. It was all right for her to use her femaleness as an agent; the Section had to have female operatives; they could do things men could not do. There have always been female spies and the young and pretty ones had always used the same tools.

But she should not have agreed to use them against another agent, inside her own Section—at least, she should not have used them against *me*.

Not very logical, is it? It was logical to me. Mary shouldn't have done it.

I was through, I was finished. They could go ahead with Operation Parasite without me; I'd had it. I owned a cabin up in the Adirondacks; I had enough stuff there in deep freeze to carry me for years—well, a year, anyhow. I had plenty of tempus pills and could get more; I would go up there and use them—and the world could save itself, or go to hell, without me.

If anyone came within a hundred yards of me, he would either show a bare back or be burned down.

XI

I had to tell somebody about it and Doris was the goat. It may have been classified information but I did not give a hoot. It turned out that Doris knew all about Operation Parasite; there was no reason to try to keep any part of it secret. The trouble was to make it not a secret—but I am ahead of myself.

Doris was indignant—shucks, she was sore as a boiled owl. She had dressed what they had done to me. Of course, as a nurse, she had dressed a lot worse, but this had been done *by our own people*. I blurted out how I felt about Mary's part in it. "You know that old slaughterhouse trick," I asked her, "where they train one animal to lead the others in? That's what they got Mary to do to me."

She had not heard of it, but she understood me. "Do I understand you that you had wanted to *marry* this girl?"

"Correct. Stupid, ain't I?"

"All men are, about women—but that's not the point. It does not make any difference whether she wanted to marry you or not; her knowing that you wanted to marry her makes what she did about eight thousand times worse. She *knew* what she could do to you. It wasn't fair." She stopped massaging me, her eyes snapping. "I've never met your redhead, not yet—but if I ever do, I'll scratch her face!"

I smiled at her. "You're a good kid, Doris. I believe you would play fair with a man."

"Oh, I'm no angel, and I've pulled some fast ones in my time. But if I did anything halfway like that. I'd have to break every mirror I own. Turn a bit, and I'll get the other leg."

Mary showed up. The first I knew about it was hearing Doris say angrily, "You can't come in."

Mary's voice answered, "I'm going in. Try to stop me."

Doris squealed, "Stay where you are—or I'll pull that hennaed hair out by the roots!"

There was a short silence, sounds of a scuffle—and the *smack*! of someone getting slapped, hard. I yelled out, "Hey! What goes on?"

They appeared in the doorway together. Doris was breathing hard and her hair was mussed. Mary managed to look dignified and composed, but there was a bright red patch on her left cheek the size and shape of Doris's hand. She looked at me and ignored the nurse.

Doris caught her breath and said, "You get out of here. He doesn't want to see you."

Mary said, "I'll hear that from him."

I looked at them both, then said, "Oh, what the hell—Doris, she's here; I'll talk to her. I've got some things to tell her, in any case. Thanks for trying."

Doris waited a moment, then said, "You're a fool!" and flounced out.

Mary came over to the bed. "Sam," she said. "Sam."

"My name isn't 'Sam'."

"I've never known your right name."

I hesitated. It was no time to explain to her that my parents had been silly enough to burden me with 'Elihu'. I answered, "What of it? 'Sam' will do."

"Sam," she repeated. "Oh Sam, my dear."

"I am not your 'dear'."

She inclined her head. "Yes, I know that. I don't know why. Sam, I came here to find out why you hate me. Perhaps I can't change it, but I must know why."

I made some sound of disgust. "After what you did, you don't know why? Mary, you may be a cold fish, but you aren't stupid. I know; I've worked with you."

She shook her head. "Just backwards, Sam. I'm not cold, but I'm frequently stupid. Look at me, please—I know what they did to you. I know that you let it be done to save me from the same thing. I know that and I'm deeply grateful. But I don't know why you hate me. You did not have to do it, I did not ask you to do it, and I did not want you to do it."

I didn't answer; presently she said, "You don't believe me?"

I reared up on one elbow. "I believe you. I believe you have yourself convinced that that is how it was. Now I'll tell *you* how it was."

"Do, please."

"You sat down in that trick chair knowing that I would never let you go through with it. You *knew* that, whether that devious female mind of yours admitted it to itself or not. The Old Man could not have forced me into that chair, not with a gun, not even with drugs. But *you* could. You did. You were the one who forced me to go through with something which I would rather have been dead than touched . . . a thing that now leaves me dirty and spoiled. You did it."

She had grown steadily whiter as I talked, until her face was almost green against her hair. She caught her breath and said, "You believe that, Sam?"

"What else?"

"Sam, that is not the way it was. I did not know you were going to be in there. I was terribly startled. But there was nothing to do but go through with it; I had promised."

"'Promised'," I repeated. "That covers everything, a schoolgirl promise."

"Hardly a schoolgirl promise."

"No matter. And it doesn't matter whether you are telling the truth or not about knowing that I would be in there—you aren't, of course, but it doesn't matter. The point is: *you* were there and *I* was there—and you could figure what would happen if you did what you did do."

"Oh." She waited a bit, then went on, "That's the way it looks to you and I can't dispute the facts."

"Hardly."

She stood very still for a long time. I let her. Finally she said, "Sam—once you said something to me about wanting to marry me."

"I remember something of the sort. That was another day."

"I didn't expect you to renew the offer. But there was something else, a sort of corollary. Sam, no matter what you think of me, I want to tell you that I am deeply grateful for what you did for me. Uh, Miss Barkis is willing, Sam—you understand me?"

This time I grinned at her. "A female to the very end! Honest so help me, the workings of the female mind continue to delight and astound me. You always think you can cancel out the score and start over with that one trump play." I continued to grin at her while she turned red. "It won't work. Not this time. I won't inconvenience you by taking up your no-doubt generous offer."

She continued to blush but she came back at me in a steady, level voice, "I let myself in for that. Nevertheless, it's true. That—or anything else I can ever do for you."

My elbow was going to sleep; I sank back and lay down. "Sure, you can do something for me."

Her face lit up. "What?"

"Go away and quit bothering me. I'm tired." I turned my face away. I did not hear her leave, but I heard Doris come back in. She was bristling like a fox terrier; they must have passed in the hall. She faced me, fists on her hips, looking cute and adorable and very indignant. "She got around you, didn't she?"

"I don't think so."

"Don't lie to me. You went soft on her. I know—men always do. The idiots! A woman like that, all she has to do is shake her fanny at a man and he rolls over and plays dead."

"Well, I didn't. I gave her what for."

"You're sure you did?"

"I did—and sent her packing."

Doris looked doubtful. "I hope you did. Maybe you did—she wasn't looking too pert as she came out." She dismissed the matter. "How do you feel?"

"Pretty good"—it was a lie, net.

"Want some massage?"

"No, just come here and sit on the bed and talk to me. Want a cigarette?"

"Well—as long as the doctor doesn't catch me." She perched up on the bed; I struck cigarettes for both of us and stuck hers in her mouth. She took a deep drag, swelling out her chest and pushing her arrogant breasts against her halter almost to the breaking point. I thought again what a sweet dish she was; she was just what I needed to take my mind off Mary.

We talked for a while. Doris gave her views on women—it appeared she disapproved of them on principle, although she was not in the least apologetic about being one herself—on the contrary! "Take women patients," she said. "One of the reasons I took this job was because we don't get a woman patient once in a coon's age. A man patient appreciates what is done for him. A woman just expects it and hollers for more."

"Would you be that sort of patient?" I asked, just to tease her.

"I hope not. I'm healthy, thank the Lord." She crushed out her cigarette and jumped off the bed, bouncing a little. "Got to get out of here. Scream if you want anything."

"Doris—"

"Yes?"

"You got any leave coming up?"

"I plan to take two weeks shortly. Why?"

"I was thinking. I'm going on leave—at least. I've got a shack in the Adirondacks. How about it? We could have a nice time and forget this madhouse."

She dimpled. "You know, that's mighty white of you, podnuh." She came over and kissed me full on the mouth, the first time she had done so. "And if I weren't an old married lady, with a pair of twins in the bargain, I might take you up."

"Oh."

"Sorry. But thanks for the compliment. You've made my day."

She started for the door. I called out, "Doris, wait a minute." When she stopped I added, "I didn't know. Look, why don't you take me up on it anyhow? The cabin, I mean—take your old man and the kids up there and give 'em a good time. I'll give you the combo and the transponder code."

"You mean that?"

"Of course I do."

"Well—I'll talk to you later. Thanks." She came back and kissed me again and it made me wish she had not been married, or, at least, not working at it. Then she left.

The doctor came in a bit later. While he was fiddling with the futile things doctors do, I said, "That nurse. Miss Marsden—is she married?"

"What business is it of yours?"

"I just wanted to know."

"You keep your hands off my nurses—or I'll fit you with mittens. Now stick out your tongue."

The Old Man put his head in late that afternoon. My immediate response was pleasure; the Old Man's personality is hard to shake off. Then I remembered and went cold.

"I want to talk to you," he started in.

"I don't want to talk to you. Get out."

He ignored my remarks and came in, dragging his bad leg. "Mind if I sit down?"

"You seem to be doing so."

He ignored that, too. He wrinkled his face and scowled. "You know, son, you are one of my best boys, but sometimes you are a little hasty."

"Don't let that worry you," I answered, "as soon as the doctor lets me out of here. I'm through." I had not really decided up until then, but it seemed as necessary as syrup with buckwheat cakes. I no longer trusted the Old Man; the rest was obvious.

He was not hearing anything that he did not choose to hear. "You're too hasty. You jump to conclusions. Now take this girl Mary—"

"Mary who?"

"You know who I mean; you know her as 'Mary Cavanaugh'."

"*You* take her."

"You jumped all over her without knowing the score. You've got her all upset. Matter of fact, you may have ruined a good agent for me."

"Hmmph! I'm in tears about it."

"Listen, you young snot, you didn't have any call to be rough on her. You don't know the facts."

I did not answer; explanations are a poor defense.

"Oh, I know that you think you do," he went on. "You think she let herself be used as bait to get you to take part in that job we did. Well, you've got it slightly wrong. She was being used as bait, but *I* was using *her*. I planned it that way."

"I know you did."

"Then why blame her?"

"Because, although you planned it, you couldn't have carried it out without her active cooperation. It's mighty big of you, you no-good, heartless bastard, to take all the blame—but you can't."

He did not hear my profanity, either. He went on, "You understand everything about it but the key point, which is—*the girl didn't know*."

"Hell's bells, she was *there*."

"So she was. Son, did you ever know me to lie to you?"

"No," I admitted, "but I don't think you would hesitate."

He looked pained but answered, "Maybe I deserve that. I'd lie to one of my own people if the country's safety depended on it. I haven't found it necessary up till now because I've been choosy about who works for me. But this time the country's welfare doesn't depend on it and I'm not lying and you'll just have to test it for yourself, any way you can figure out, and make up your mind whether or not I'm lying. That girl didn't know. She didn't know you were going to be in that room. She didn't know why you were in there. She didn't know that there was any question about who was going to sit in that chair. She didn't have the faintest suspicion that I didn't mean for her to go through with it, or that I had already decided that you were the only party who would suit me, even if I had to have you tied down and forced—which I would have done, if I hadn't had a double whammy up my sleeve to trick you into volunteering. Hell's bells yourself, son; she didn't even know you were off the sick list."

I wanted to believe it, so I did my damnedest not to believe it. If it were a lie, it would be just the shape of lie he would tell. As to whether he would bother to lie—well, getting two prime agents back into the groove might be something he would class, just now, as involving the country's safety. The Old Man had a complex mind.

"Look at me!" he added. I snapped out of my brown study and looked up. "There is something else I want you to know and I want to rub your nose in it. First off, let me say that everybody—including me—appreciates what you did, regardless of your motives. I'm putting in a letter about it and no doubt there will be a medal in due time. That stands, whether you stay with the Section or not. And if you go, I'll help you with any transfer or such you may want."

He paused for breath, then went on. "But don't go giving yourself airs as a little tin hero—"

"I won't!"

"—because that medal is going to the wrong person. Mary ought to get it.

"Now hush up; I'm not through. You had to be forced into it, like building a fire under a mule. No criticism; you had been through plenty. But Mary was a real, honest-to-God, Simon-pure volunteer. When she sat down in that chair, she didn't know what was going to happen to her. She didn't expect any last minute reprieve and she had every reason to believe that, if she got up alive, her reason would be gone, which is worse. But she did it—because she is a hero, which you miss by a couple of points."

He went on without waiting for me to reply; "Listen, son—most women are damn fools and children. But they've got more range than we've got. The brave ones are braver, the good ones are better—and the vile ones are viler, for that matter. What I'm trying to tell you is: this one is more of a man than you are and you've done her a serious wrong."

I was so churned up inside that I could not judge for the life of me whether he was telling the truth, or manipulating me again. I said, "Maybe so. Maybe I lashed out at the wrong person. But if what you say is true—"

"It is."

"—it doesn't make what you did any sweeter; it makes it worse."

He took it without flinching. "Son, I'm sorry if I've lost your respect. But I'd do it again under the same circumstances. I can't be choosy about such things any more than can a commander in battle. Less, because I fight with different weapons. I've always been able to shoot my own dog. Maybe that's good; maybe that's bad—but that is what my job takes. If you are ever in my shoes, you'll have to do it, too."

"I'm not likely to be."

"Why don't you take leave, rest up, and think about it?"

"I'll take leave—terminal leave."

"Very well." He started to leave; I said, "Wait—"

"Yes?"

"You made me one promise and I'm holding you to it. About that parasite—you said I could kill it, personally. Are you through with it?"

"Yes, I'm through with it, but—"

I started to get out of bed. "No 'buts'. Give me your gun; I'm going to kill it *now*."

"But you can't. It's already dead."

"What! You *promised* me."

"I know I did. But it died while we were trying to force you—to force *it*—to talk."

I sat down and started to shake with laughter. I got started and could not stop. I was not enjoying it; I could not help it.

The Old Man grasped my shoulders and shook me. "Snap out of it! You'll get yourself sick. I'm sorry about it, but there's nothing to laugh at. It could not be helped."

"Ah, but there is," I answered, still sobbing and chuckling. "It's the funniest thing that ever happened to me. All that—and all for nothing. You dirtied yourself and you loused up me and Mary—and all for no use."

"Huh? Whatever gave you that idea?"

"Eh? I *know*—I know everything that went on. And you didn't even get small change out of it—out of us, I should say. You didn't learn anything you didn't know before."

"The hell we didn't!"

"And the hell you did."

"It was a bigger success than you'd ever guess, son. True, we didn't squeeze anything out of it directly, before it died—but we got something out of you."

"Me?"

"Last night. We put you through it last night. You were doped, psyched, brain-waved, analyzed, wrung out, and hung out to dry. The parasite spilled things to you and they were still there for the hypno-analysts to pick up after you were free of it."

"What?"

"Where they live. We know where they come from and can fight back—Titan, sixth satellite of Saturn."

When he said it, I felt a sudden gagging constriction of my throat—and I knew that he was right.

"You certainly fought before we could get it out of you," he went on reminiscently. "We had to hold you down to keep you from hurting yourself—more."

Instead of leaving he threw his game leg over the edge of the bed and struck a cigarette. He seemed anxious to be friendly. As for me, I did not want to fight with him further; my head was spinning and I had things to get straight. Titan—that was a long way out. Mars was the farthest men had ever been, unless the Seagraves Expedition, the one that never came back, got out to the Jovian moons.

Still, we could get there, if there were a reason for it. We would burn out their nest!

Finally he got up to go. He had limped almost to the door when I stopped him again. "Dad—"

I had not called him that in years. He turned and his face held a surprised and defenseless expression. "Yes, son?"

"Why did you and mother name me 'Elihu'?"

"Eh? Why, it seemed the thing to do at the time. It was your maternal grandfather's name."

"Oh. Not enough reason. I'd say."

"Perhaps not." He turned again and again I stopped him.

"Dad—what sort of a person was my mother?"

"Your mother? I don't exactly know how to tell you. Well—she was a great deal like Mary. Yes, sir, a great deal like her." He turned and stumped out without giving me any further chance to talk.

I turned my face to the wall. After a while I steadied down.

XII

This is a personal account of my angle of view on events known to everybody. I'm not writing history. For one thing, I don't have the broad viewpoint.

Maybe I should have been sweating about the fate of the world when I was actually stewing about my own affairs. Maybe. But I never heard of a man with a blighty wound caring too much about how the battle turned out.

Anyhow, there did not seem much to worry about. I knew that the President had been saved under circumstances which would open up anybody's eyes, even a politician's, and that was, as I saw it, the last real hurdle. The slugs—the titans, that is—were dependent on secrecy; once out in the open they could not possibly hold out against the massed strength of the United States. They had no powers except those they borrowed from their slaves, as I knew better than anybody.

Now we could clean up their beachhead here; then we could go after them where they lived. But planning interplanetary expeditions was hardly my job. I knew as much about that subject as I knew about Egyptian art.

When the doctor released me I went looking for Mary. I still had nothing but the Old Man's word for it, but I had more than a suspicion that I had made a big hairy thing of myself. I did not expect her to be glad to see me, but I had to speak my piece.

You would think that a tall, handsome redhead would be as easy to find as flat ground in Kansas. She would have been had she been a member of the in staff, but she was a field agent. Field agents come and go and the resident personnel are encouraged to mind their own business. Doris had not seen her again—so she said—and was annoyed that I should want to find her.

The personnel office gave me the bland brush off. I was not inquiring officially, I did not know the agent's name, and just who did I think I was, anyway? They referred me to Operations, meaning the Old Man. That did not suit me.

I had no more luck and met with even more suspicion when I tried the door tally; I began to feel like a spy in my own section.

I went to the bio lab, could not find its chief, and talked to an assistant. He did not know anything about a girl in connection with Project Interview; the subject had been a man—he knew; he had seen the stereo. I told him to take a close look at me. He did and said, "Oh, were you that guy? Pal, you sure took a beating." He went back to scratching himself and shuffling reports.

I left without saying thank you and went to the Old Man's office. There seemed to be no choice.

There was a new face at Miss Haines's desk. I never saw Miss Haines again after the night I got taken. Nor did I ask what had become of her; I did not want to know. The new secretary passed in my I.D. code and, for a wonder, the Old Man was in and would see me.

"What do you want?" he said grumpily.

I said, "Thought you might have some work for me," which was not at all what I intended to say.

"Matter of fact, I was just fixing to send for you. You've loafed long enough." He barked something at his desk phone, stood up and said, "Come!"

I felt suddenly at peace, and followed him. "Cosmetics?" I asked.

"Your own ugly face will do. We're headed for Washington." Nevertheless we did stop in Cosmetics, but only for street clothes. I drew a gun—my own had gone where the woodbine twineth—and had my phone checked.

The door guard made us bare our backs before he would let us approach and check out. Then we tucked our shirts in and went on up, coming out in the lower levels of New Philadelphia, the first I had known as to the location of the Section's new base. "I take it this burg is clean?" I said to the Old Man.

"If you do, you are rusty in the head," he answered. "Keep your eyes peeled."

There was no opportunity for more questions. The presence of so many fully clothed humans bothered me; I found myself drawing away from people and watching for round shoulders. Getting into a crowded elevator to go up to the launching platform seemed downright reckless. When we were in our car and the controls set, I said so. "What in the devil do the authorities in that dump think they are doing? I could swear that at least one cop we passed was wearing a hump."

"Possibly. Even probably."

"Well, for crying in church! What goes on? I thought you had this job taped and that we were fighting back on all fronts."

"We're trying to. What would you suggest we do about it?"

"Why, it's obvious—even if it were freezing cold, we ought not to see a back covered up anywhere, not until we know they are all dead."

"That's right."

"Well, then—Look, the President knows the score, doesn't he? I understand that—"

"He knows it."

"What's he waiting for? For the whole country to be taken over? He should declare martial law and get action. You told him, a long time ago."

"So I did." The Old Man stared down at the countryside. "Son, are you under the impression that the President runs the country?"

"Of course not. But he is the only man who can act."

"Mmmm—They sometimes call Premier Tsvetkov 'the Prisoner of the Kremlin'. True or not, the President is the prisoner of Congress."

"You mean Congress *hasn't acted*?"

"I have spent my time the past several days—ever since we stopped the attempt on the President—trying to help the President convince them. Ever been worked over by a congressional committee, son?"

I tried to figure it out. Here we sat, as stupid as dodoes walking up a gangplank to be slugged—yes, and *homo sapiens* would be as extinct as the dodo if we did not move. Presently the Old Man said, "It's time you learned the political facts of life. Congresses have refused to act in the face of dangers more obvious than this one. This one isn't obvious, not until a man has had it in his lap, the way we have. The evidence is slim and hard to believe."

"But how about the Assistant Secretary of the Treasury? They can't ignore that."

"Can't they? The Assistant Secretary had one snatched off his back, right in the East Wing, and we killed two of his Secret Service guards. And now the honorable gent is in Walter Reed with a nervous breakdown and can't recall what happened. The Treasury Department gave out that an attempt to assassinate the President had been foiled—true, but not the way they meant it."

"And the President held still for that?"

"His advisers told him to wait until he can get congressional support. His majority is uncertain at best—and there are stalwart statesmen in both houses who want his head on a platter. Party politics is a rough game."

"Good Lord, partisanship doesn't figure in a case like this!"

The Old Man cocked an eyebrow. "You think not, eh?"

I finally managed to ask him the question I had come into his office to ask: where was Mary?

"Odd question from you," he grunted. I let it ride; he went on, "Where she should be. Guarding the President."

We went first to a room where a joint special committee was going over evidence. It was a closed session but the Old Man had passes. When we got there they were running stereos; we slipped into seats and watched.

The films were of my anthropoid friend. Napoleon—the ape himself, shots of him with the titan on his back, then closeups of the titan. It made me sick to see it. One parasite looks like another; but I knew which one this was and I was deeply glad it was dead.

The ape gave way to me myself. I saw myself being clamped into the chair. I hate to admit how I looked; real funk is not pretty. A voice off screen told what was going on.

I saw them lift the titan off the ape and onto my own bare back. Then I fainted in the picture—and almost fainted again. I won't describe it and it upsets me to tell about it. I saw myself writhing under the shocks given the titan—and I writhed again. At one point I tore my right hand free of the clamps, something I had not known, but which explained why my wrist was still not healed.

And I saw the thing *die*. That was worth sitting through the rest.

The film ended and the chairman said, "Well, gentlemen?"

"Mr. Chairman!"

"The gentleman from Indiana is recognized."

"Speaking without prejudice to the issue, I must say that I have seen better trick photography from Hollywood." They tittered and someone called out, "Hear! Hear!" I knew the ball game was gone.

The head of our bio lab testified, then I found myself called to the stand. I gave my name, address, and occupation, then perfunctorily was asked a number of questions, about my experiences under the titans. The questions were read from a sheet and the chairman obviously was not familiar with them.

The thing that got me was that they did not *want* to hear. Two of them were reading newspapers.

There were only two questions from the floor. One senator said to me, "Mr. Nivens—your name *is* Nivens?"

I agreed that it was. "Mr. Nivens," he went on, "you say that you are an investigator?"

"Yes."

"F.B.I., no doubt?"

"No, my chief reports directly to the President."

The senator smiled. "*Just* as I thought. Now Mr. Nivens, you say you are an investigator—but as a matter of fact you are an actor, are you not?" He seemed to be consulting notes.

I tried to tell too much truth. I wanted to say that I had once acted one season of summer stock but that I was, nevertheless, a real, live, sure-enough investigator. I got no chance. "That will *do,* Mr. Nivens. Thank you."

The other question was put to me by an elderly senator whose name I should have known. He wanted to know my views on using tax money to arm other countries—and he used the question to express his own views. My views on that subject are cloudy but it did not matter, as I did not get to express them. The next thing I knew the clerk was saying, "Stand down, Mr. Nivens."

I sat tight. "Look here," I said, "all of you. It's evident that you don't believe me and think this is a put-up job. Well, for the love of heaven, bring in a lie detector! Or use the sleep test. This hearing is a joke."

The chairman banged his gavel. "Stand down, Mr. Nivens."

I stood.

The Old Man had told me that the purpose of the meeting was to report out a joint resolution declaring total emergency and vesting war powers in the President. The chairman asked if they were ready to consider the resolution. One of the newspaper readers looked up long enough to say, "Mr. Chairman, I call for clearing the committee room."

So we were ejected. I said to the Old Man, "It looks bad to this boy."

"Forget it," he said. "The President knew this gambit had failed when he heard the names of the committee."

"Where does that leave us? Do we wait for the slugs to take over Congress, too?"

"The President goes right ahead with a message to Congress and a request for full powers."

"Will he get them?"

The Old Man screwed up his face. "Frankly, I don't think he stands a chance."

The joint session was secret, of course, but we were present—direct orders of the President, probably. The Old Man and I were on that little balcony business back of the Speaker's rostrum. They opened it with full rigamarole and then went through the ceremony of appointing two members from each house to notify the President.

I suppose he was right outside for he came in at once, escorted by the delegation. His guards were with him—but they were all our men.

Mary was with him, too. Somebody set up a folding chair for her, right by the President. She fiddled with a notebook and handed papers to him, pretending to be a secretary. But the disguise ended there; she had it turned on full blast and looked like Cleopatra on a warm night—and as out of place as a bed in church. I could feel them stir; she got as much attention as the President did.

Even the President noticed it. You could see that he wished that he had left her at home, but it was too late to do anything about it without greater embarrassment.

You can bet I noticed her. I caught her eye—and she gave me a long, slow, sweet smile. I grinned like a collie pup until the Old Man dug me in the ribs. Then I settled back and tried to behave but I was happy.

The President made a reasoned explanation of the situation, why we knew it to be so and what had to be done. It was as straightforward and rational as an engineering report, and about as moving. He simply stated facts. He put aside his notes at the end. "This is such a strange and terrible emergency, so totally beyond any previous experience, that I must ask very broad powers to cope with it. In some areas, martial law must be declared. Grave invasions of civil guarantees will be necessary, for a time. The right of free movement must be abridged. The right to be secure from arbitrary search and seizure must give way to the right of safety for everyone. Because any citizen, no matter how respected or how loyal, may be the unwilling servant of these secret enemies, all citizens must face some loss of civil rights and personal dignities until this plague is killed.

"With utmost reluctance, I ask that you authorize these necessary steps." With that he sat down.

You can feel a crowd. They were made uneasy, but he did not carry them. The president of the Senate took the gavel and looked at the Senate majority leader; it had been programmed for him to propose the emergency resolution.

Something slipped. I don't know whether the floor leader shook his head or signaled, but he did not take the floor. Meanwhile the delay was getting awkward and there were cries of, "Mister President!" and "Order!"

The Senate president passed over several others and gave the floor to a member of his own party. I recognized the man—Senator Gottlieb, a wheelhorse who would vote for his own lynching if it were on his party's program. He started out by yielding to none in his respect for the Constitution, the Bill of Rights, and, probably, the Grand Canyon. He pointed modestly to his own long and faithful service and spoke well of America's place in history.

I thought he was beating the drum while the boys worked out a new shift—when I suddenly realized that his words were adding up to meaning: he was proposing to suspend the order of business and get on with the impeachment and trial of the President of the United States!

I think I tumbled to it as quickly as anyone; the senator had his proposal so decked out in ritualistic verbiage that it was a wonder that anyone noticed what he was actually saying. I looked at the Old Man.

The Old Man was looking at Mary.

She was looking back at him with an expression of extreme urgency.

The Old Man snatched a pad out of his pocket, scrawled something, wadded it up, and threw it down to Mary. She caught it, opened it, and read it—and passed it to the President.

He was sitting, relaxed and easy—as if one of his oldest friends were not at that moment tearing his name to shreds and, with it, the safety of the Republic. He put on his old-fashioned specs and read the note. He then glanced unhurriedly around at the Old Man and lifted his eyebrows. The Old Man nodded.

The President nudged the Senate president, who, at the President's gesture, bent over him. The President and he exchanged whispers.

Gottlieb was still rumbling along about his deep sorrow, but that there came times when old friendship must give way to a higher duty and therefore— The Senate president banged his gavel. "If the senator please!"

Gottlieb looked startled and said, "I do not yield."

"The senator is not asked to yield. At the request of the President of the United States, because of the importance of what you are saying, the senator is asked to come to the rostrum to speak."

Gottlieb looked puzzled but there was nothing else he could do. He walked slowly toward the front of the house.

Mary's chair blocked the little stairway up to the rostrum. Instead of getting quietly out of the way, she bumbled around, turning and picking up the chair, so that she got even more in the way. Gottlieb stopped and she brushed against him. He caught her arm, as much to steady himself as her. She spoke to him and he to her, but no one else could hear the words. Finally they got around each other and he went on to the front of the rostrum.

The Old Man was quivering like a dog in point. Mary looked up at him and nodded. The Old Man said, "Take him!"

I was over that rail in a flying leap, as if I had been wound up like a crossbow. I landed on Gottlieb's shoulders.

I heard the Old Man shout, "Gloves, son! Gloves!" I did not stop for them. I split the senator's jacket with my bare hands and I could see the slug pulsing under his shirt. I tore the shirt away and anybody could see it.

Six stereo cameras could not have recorded what happened in the next few seconds. I slugged Gottlieb back of the ear to stop his thrashing. Mary was sitting on his legs. The President was standing over me and pointing, while shouting, "There! There! Now you can *all* see." The Senate president was standing stupefied, waggling his gavel.

The Congress was just a mob, men yelling and women screaming. Above me the Old Man was shouting orders to the presidential guards as if he were standing on a bridge.

We had this in our favor; doors were locked and there were no armed and disciplined men present except the Old Man's own boys. Sergeants-at-arms, surely—but what are they? One elderly Congressman pulled a hogleg out of his coat that must have been a museum piece, but that was a mere incident.

Between the guns of the guards and the pounding of the gavel something like order was restored. The President started to talk. He told them that an amazing accident had given them a chance to see the true nature of the enemy and he suggested that they file past and see for themselves one of the titans from Saturn's largest moon. Without waiting for their consent, he pointed to the front row and told them to come up.

They came.

I squatted back out of the way and wondered what was accidental about it. With the Old Man you can never tell. Had he *known* that Congress was infested? I rubbed a bruised knee and wondered.

Mary stayed on the platform. About twenty had filed by and a female Congressman had gotten hysterics when I saw Mary signal the Old Man again. This time I was a hair ahead of his order.

I might have had quite a fight if two of the boys had not been close by; this one was young and tough, an ex-marine. We laid him beside Gottlieb, and again the Old Man and the President and the Senate president, shouting their lungs out, restored order.

Then it was "inspection and search" whether they liked it or not. I patted the women on the back as they came by and caught one. I thought I had caught another, but it was an embarrassing mistake; she was so blubber fat that I guessed wrong.

Mary spotted two more, then there was a long stretch, three hundred or more, with no jackpots. It was soon evident that some were hanging back.

Don't let anyone tell you that Congressmen are stupid. It takes brains to get elected and it takes a practical psychologist to stay elected. Eight men with guns were not enough—eleven, counting the

Old Man, Mary, and me. Most of the slugs would have gotten away if the Whip of the House had not organized help.

With their assistance, we caught thirteen, ten alive. Only one of the hosts was badly wounded.

But the Congress of the United States has not been such a shambles since Jefferson Davis announced his momentous decision. No, not even after the Bombing.

XIII

So the President got the authority he needed and the Old Man was his *de facto* chief of staff; at last we could move fast and effectively. Oh, yes? Did you ever try to hurry a project through a bureaucracy?

"Directives" have to be "implemented"; "agencies" have to be "coordinated"—and everything has to go to the files.

The Old Man had a simple enough campaign in mind. It could not be the straightforward quarantine he had proposed when the infection was limited to the Des Moines area; before we could fight back, we had to locate them. But government agents couldn't search two hundred million people; the people had to do it themselves.

Schedule Bare Back was to be the first phase of the implementation of Operation Parasite—which makes *me* talk like a bureaucrat. Never mind—the idea was that everybody, *everybody* was to peel to the waist and stay peeled, until all titans were spotted and killed. Oh, women could have halter strings across their backs, but a parasite could not hide under a bra string.

We whipped up a visual presentation to go with the stereocast speech the President would make to the nation. Fast work had saved seven of the parasites we had flushed in the sacred halls of Congress and now they were alive on animal hosts. We could show them and we could show the less grisly parts of the film taken of me. The President himself would appear in the 'cast in shorts, and models would demonstrate what the Well Undressed Citizen Would Wear This Season, including the metal head-and-spine armor which was intended to protect a person even if a parasite got to him in his sleep.

We got it ready in one black-coffee night and the President's writers had his lines ready for him. The smash finish was to show Congress in session, discussing the emergency, and every man, woman, and page boy showing a bare back to the camera.

With twentyeight minutes left until stereocast time the President got a call from up the street. I was present; the Old Man had been with the President all night, and had kept me around for chores. Mary was there, of course; the President was her special charge. We were all in shorts; Schedule Bare Back had already started in the White House. The only ones who looked comfortable in the get-up were Mary, who can wear anything, the colored doorman, who carried himself like a Zulu king, and the President himself, whose innate dignity could not be touched.

When the call came in the President did not bother to cut us out of his end of the conversation. "Speaking," he said. Presently he added, "You feel certain? Very well, John, what do you advise . . . . I see. No, I don't think that would work. . . . I had better come up the street. Tell them to be ready." He pushed back the phone, his face still serene, and turned to an assistant. "Tell them to hold up the broadcast." He turned to the Old Man. "Come, Andrew, we must go to the Capitol."

He sent for his valet and retired into a dressing room adjoining his office; when he came out, he was formally dressed for a state occasion. He offered no explanation, the Old Man raised an eyebrow but said nothing and I did not dare say anything. The rest of us stayed in our gooseflesh specials and so we went to the Capitol.

It was a joint session, the second in less than twenty-four hours. We trooped in—and I got that no-pants-in-church nightmare feeling, for the Congressmen and senators were dressed as usual. Then I saw that the page boys were in shorts without shirts and felt somewhat better.

I still don't understand it. It seems that some people would rather be dead than lose dignity, with senators high on the list. Congressmen, too—a Congressman is a man who wants to be a senator. They had given the President all the authority he asked for; Schedule Bare Back itself had been discussed and approved—but they did not see where it applied to them. After all, they had been searched and cleaned out; Congress was the only group in the country known to be free of titans.

Maybe some saw the holes in the argument, but not one wanted to be first in a public striptease. Face and dignity are indispensable to an office holder. They sat tight, fully dressed.

When the President took the rostrum, he simply looked at them until he got dead silence. Then slowly, calmly, he started taking off clothes.

He stopped when he was bare to the waist. He had had me worried for a moment; I think he had others worried. He then turned slowly around, lifting his arms. At last he spoke.

"I did that," he said, "so that you might see for yourself that your Chief Executive is not a prisoner of the enemy." He paused.

"But how about *you*?" That last word was flung at them.

The President punched a finger at the junior Whip. "Mark Cummings—how about *you*? Are you a loyal citizen or are you a zombie spy? Get up! Get your shirt off!"

"Mister President—" It was Charity Evans, from the State of Maine, looking like a pretty schoolteacher. She stood and I saw that, while she was fully dressed, she was in evening dress. Her gown reached to the floor, but was cut as deep as could be above. She turned like a mannequin; in back the dress ended at the base of her spine; in front it came up in two well-filled scallops. "Is this satisfactory, Mr. President?"

"Quite satisfactory, madam."

Cummings was on his feet and fumbling at his jacket; his face was scarlet. Someone stood up in the middle of the hall.

It was Senator Gottlieb. He looked as if he should have been in bed; his cheeks were gray and sunken; his lips showed cyanosis. But he held himself erect and, with incredible dignity, followed the President's example. His old-fashioned underwear was a one-piece job; he wriggled his arms out and let it dangle over his galluses. Then he, too, turned all the way around; on his back, scarlet against his fish-white flesh, was the mark of the parasite.

He spoke. "Last night I stood here and said things I would rather have been flayed alive than utter. But last night I was not my own master. Today I am. Can you not see that Rome is burning?" Suddenly he had a gun in his hand. "Up on your feet, you wardheelers, you courthouse loafers! Two minutes to get your duds off and show a bare back—then I shoot!"

Men close to him sprang up and tried to grab his arm, but he swung the gun around like a flyswatter, smashing one of them in the face. I had my own out, ready to back his play, but it was not necessary. They could see that he was as dangerous as an old bull and they backed away.

It hung in balance, then they started shucking clothes like Doukhobors. One man bolted for a door; he was tripped. No, he was not wearing a parasite.

But we did catch three. After that, the show went on the channels, ten minutes late, and Congress started the first of its "bare back" sessions.

XIV

"LOCK YOUR DOORS!"

"CLOSE THE DAMPERS ON YOUR FIREPLACES!"

"NEVER ENTER A DARK PLACE!"

"BE WARY OF CROWDS!"

"A MAN WEARING A COAT IS AN ENEMY—SHOOT!"

We should have had every titan in the country spotted and killed in a week. I don't know what more we could have done. In addition to a steady barrage of propaganda the country was being quartered and sectioned from the air, searching for flying saucers on the ground. Our radar screen was on full alert for unidentified blips. Military units, from airborne troops to guided-rocket stations, were ready to smear any that landed.

Then nothing happened. There was no work for them to do. The thing fizzled like a damp firecracker.

In the uncontaminated areas people took off their shirts, willingly or reluctantly, looked around them and found no parasites. They watched their newscasts and wondered and waited for the government to tell them that the danger was over. But nothing happened and both laymen and local officials began to doubt the necessity of running around the streets in sunbathing costumes. We had shouted "Wolf!" and no wolf came.

The contaminated areas? The reports from the contaminated areas were *not materially different from the reports from other areas*.

Our stereocast and the follow-ups did not reach those areas. Back in the days of radio it could not have happened; the Washington station where the 'cast originated could have blanketed the country. But stereo-video rides wavelengths so short that horizon-to-horizon relay is necessary and local channels must be squirted out of local stations; it's the price we pay for plenty of channels and high resolution pictures.

In the infected areas *the slugs* controlled the local stations; the people never heard the warning.

But in Washington we had every reason to believe that they *had* heard the warning. Reports came back from—well, Iowa, for example, just like those from California. The governor of Iowa was one of the first to send a message to the President, promising full cooperation. The Iowa state police were already cruising the roads, he reported, stopping everybody and requiring them to strip to the waist. Air travel above Iowa was stopped for the duration of the emergency, just as the President had urged.

There was even a relayed stereo of the governor addressing his constituents, bare to the waist. He faced the camera and I wanted to tell him to turn around. But presently they cut to another camera and we had a close up of a bare back, while the governor's voice went cheerfully on, urging all citizens to work with the police.

If any place in the Union was a pest house of slugs, Iowa should have been it. Had they evacuated Iowa and concentrated on heavier centers of population?

We were gathered in a conference room off the President's office. The President had kept the Old Man with him, I tagged along, and Mary was still on watch. Secretary of Security Martinez was there as well as the Supreme Chief of Staff, Air Marshal Rexton. There were others from the President's "fishing cabinet", but they weren't important.

The President watched the 'cast from Iowa and turned to the Old Man. "Well, Andrew? I thought Iowa was a place we would have to fence off."

The Old Man grunted.

Marshal Rexton said, "As I figure it—mind you, I have not had much time to evaluate this situation—they have gone underground. We may have to comb every inch of every suspicious area."

The Old Man grunted again. "Combing Iowa, corn shock by corn shock, does not appeal to me."

"How else would you tackle it, sir?"

"Figure your enemy! He *can't* go underground. He can't live without a host."

"Very well—assuming that is true, how many parasites would you say are in Iowa?"

"Damn it, how should I know? They didn't take me into their confidence."

"Suppose we make a top estimate. If—"

The Old Man interrupted him. "You've got no basis for an estimate. Can't you folks see that the titans have won another round?"

"Eh?"

"You just heard the governor; they let us look at his back—or somebody's back. Did you notice that he didn't turn around in front of the camera?"

"But he did," someone said. "I saw him."

"I certainly had the impression that I saw him turn," said the President slowly. "You are suggesting that Governor Packer is himself possessed?"

"Correct. You saw what you were meant to see. There was a camera cut just before he was fully turned; people hardly ever notice them; they are used to them. Depend on it. Mister President, every message out of Iowa is faked."

The President looked thoughtful. Secretary Martinez shook his head emphatically and said, "Impossible. Granted that the governor's message could have been faked—a clever character actor could have faked it. Remember the inaugural address in the crisis of '96, when the President Elect was laid up with pneumonia? Granted that one such 'cast could be faked, we've had our choice of dozens of 'casts from Iowa. How about that street scene in Des Moines? Don't tell me you can fake hundreds of people dashing around stripped to their waists—or do your parasites practice mass hypnotic control?"

"They can't that I know of," conceded the Old Man. "If they can, we might as well throw in the towel and admit that the human race has been superseded. But what made you think that that 'cast came from Iowa?"

"Eh? Why, damn it, sir, it came over the Iowa channel."

"Proving what? Did you read any street signs? It looked like any typical street in a downtown retail district. Never mind what city the announcer *told* you it was; what city was it?"

The Secretary let his mouth hang open. I've got fairly close to the "camera eye" that detectives are supposed to have; I let that picture run through my mind—and I not only could not tell what city, I could not even place the part of the country. It could have been Memphis, Seattle, or Boston—or none of them. Allowing for special cases like Canal Street in New Orleans, or Denver's Civic Center, the downtown districts in American cities are as standardized as barber shops.

"Never mind," the Old Man went on. "I couldn't tell and I was looking for landmarks. The explanation is simple; the Des Moines station picked up a Schedule Bare Back street scene from some city not contaminated and rechanneled it under their own commentary. They chopped out anything that would localize it . . . and we swallowed it. Gentlemen, this enemy knows us, inside and out. This campaign has been planned in great detail and they are ready to outwit us in almost any move we can make."

"Aren't you being an alarmist, Andrew?" said the President. "There is another possibility, that the titans have moved somewhere else."

"They are still in Iowa," the Old Man said flatly, "but you won't prove it with that thing." He gestured at the stereo tank.

Secretary Martinez squirmed. "This is ridiculous!" he exclaimed. "You are saying that we can't get a correct report out of Iowa, as if it were occupied territory."

"That is what it is."

"But I stopped off in Des Moines two days ago, coming back from Alaska. Everything was normal. Mind you, I grant the existence of your parasites, though I haven't seen one. But let's find them where they are and root them out, instead of dreaming up fantasies."

The Old Man looked tired and I felt tired. I wondered how many ordinary people were taking it seriously, if this was what we ran into at the top.

Finally the Old Man replied, "Control the communications of a country and you control the country; that's elementary. You had better take fast steps, Mister Secretary, or you won't have any communications left."

"But I was merely—"

"*You* root 'em out!" the Old Man said rudely. "I've told you they are in Iowa—and in New Orleans, and a dozen other spots. My job is finished. You are Secretary of Security; you root 'em out." He stood up and said, "Mister President, I've had a long pull for a man my age; when I lose sleep I lose my temper. Could I be excused?"

"Certainly, Andrew." He had not lost his temper and I think the President knew it. He doesn't lose his temper; he makes other people lose theirs.

Before the Old Man could say goodnight. Secretary Martinez interrupted. "Wait a moment! You've made some flatfooted statements. Let's check up on them." He turned to the Chief of Staff. "Rexton!"

"Uh, yes, sir."

"That new post near Des Moines, Fort something-or-other, named after what's-his-name?"

"Fort Patton."

"That's it, that's it. Well, let's not dally; get them on the command circuit—"

"With visual," put in the Old Man.

"With visual, of course, and we'll show this—I mean we'll get the true situation in Iowa."

The Air Marshal handed a by-your-leave-sir to the President, went to the stereo tank and patched in with Security General Headquarters. He asked for the officer of the watch at Fort Patton, Iowa.

Shortly thereafter the stereo tank showed the inside of a military communications center. Filling the foreground was a young officer. His rank and corps showed on his cap, but his chest was bare. Martinez turned triumphantly to the Old Man. "You see?"

"I see."

"Now to make certain. Lieutenant!"

"Yes, sir!" The young fellow looked awestruck and kept glancing from one famous face to another. Reception and bi-angle were in synch; the eyes of the image looked where they seemed to look, as if he were actually sitting in the receiver tank.

"Stand up and turn around," Martinez continued.

"Uh? Why, certainly, sir." He seemed puzzled, but he did so—and it took him almost out of scan. We could see his bare back, up to about the short ribs—no higher.

"Confound it!" shouted Martinez. "*Sit down* and turn around."

"Yessir!" The youth seemed flustered. He leaned over the desk and added, "Just a moment while I widen the view angle, sir."

The picture suddenly melted and rippling rainbows chased across the tank. The young officer's voice was still coming over the audio channel. "There—is that better, sir?"

"Damn it, we can't see a thing!"

"You can't? Just a moment, sir."

We could hear him breathing heavily. Suddenly the tank came to life and I thought for a moment that we were back at Fort Patton. But it was a major on the screen this time and the place looked larger. "Supreme Headquarters," the image announced, "Communications officer of the watch. Major Donovan."

"Major," Martinez said in controlled tones, "I was hooked in with Fort Patton. What happened?"

"Yes, sir; I was monitoring it. We've had a slight technical difficulty on that channel. We'll put your call through again in a moment."

"Well, hurry!"

"Yes, sir." The tank rippled and went empty.

The Old Man stood up again. "Call me when you've cleared up that 'slight technical difficulty'. Meantime, I'm going to bed."

XV

If I have given the impression that Secretary Martinez was stupid, I am sorry. Everyone had trouble at first believing what the slugs could do. You have to see one—then you believe in the pit of your stomach.

There were no flies on Air Marshal Rexton, either. The two must have worked all night, after convincing themselves by more calls to known danger spots that "technical interruptions" do not occur so conveniently. They called the Old Man about four a.m. and he called me, using our special phones. Those flesh-embedded receptors should not be used as alarm clocks; it's too rough a way to wake a man.

They were in the same conference room, Martinez, Rexton, a couple of his high brass, and the Old Man. The President came in, wearing a bathrobe and followed by Mary, just as I arrived. Martinez started to speak but the Old Man cut in. "Let's see your back, Tom!"

The President looked surprised and Mary signaled that everything was okay, but the Old Man chose not to see her. "I mean it," he persisted.

The President said quietly, "Perfectly correct, Andrew," and slipped his robe off his shoulders. His back was clean. "If I don't set an example, how can I expect others to cooperate?"

The Old Man started to help him back into the robe, but the President shrugged him off and hung it over a chair. "I'll just have to acquire new habits. Difficult, at my age. Well, gentlemen?"

I thought myself that bare skin would take getting used to; we made an odd group. Martinez was lean and tanned, carved smooth from mahogany. I'd judge he was part Indian. Rexton had a burned-in, high-altitude tan on his face, but from his collar line down he was as white as the President. On his chest was a black cross of hair, armpit to armpit and chin to belly, while the President and the Old Man were covered front and back with grizzled, wiry fur. The Old Man's mat was so thick that mice could have nested in it.

Mary looked like a publicity pic—low angle shot to bring out the legs and careful posing, that sort. Me—well. I'm the spiritual type.

Martinez and Rexton had been shoving push pins into a map, red for bad, green for good, and a few amber ones. Reports were still coming and Rexton's assistants kept adding new pins.

Iowa looked like measles; New Orleans and the Teche country were as bad. So was Kansas City. The upper end of the Missouri-Mississippi system, from Minneapolis and St. Paul down to St. Louis, was clearly enemy territory. There were fewer red pins from there down to New Orleans—but there were no green ones.

There was another hot spot around El Paso and two on the East Coast.

The President looked it over calmly. "We shall need the help of Canada and Mexico," he said. "Any reports?"

"None that mean anything, sir."

"Canada and Mexico," the Old Man said seriously, "will be just a start. You are going to need the whole world with you on this job."

Rexton said, "We will, eh? How about Russia?"

Nobody had an answer to that one; nobody ever has. Too big to occupy and too big to ignore—World War III had not settled the Russian problem and no war ever would. The parasites might feel right at home behind the Curtain.

The President said, "We'll deal with that when we come to it." He drew a finger across the map. "Any trouble getting messages through to the Coast?"

"Apparently not, sir," Rexton told him. "They don't seem to interfere with straight-through relay. But all military communications I have shifted to one-link relay through the space stations." He glanced at his watch finger. "Space Station Gamma, at the moment."

"Hmmm—" said the President. "Andrew, could these things storm a space station?"

"How would I know?" the Old Man answered testily. "I don't know whether their ships are built for it or not. More probably they would do it by infiltration, through the supply rockets."

There was discussion as to whether or not the space stations could already have been taken over; Schedule Bare Back did not apply to the stations. Although we had built them and paid for them, since they were technically United Nations territory, the President had to wait until the United Nations acted on the entire matter.

"Don't worry about it," Rexton said suddenly.

"Why not?" the President asked.

"I am probably the only one here who has done duty in a space station. Gentlemen, the costume we are now wearing is customary in a station. A man fully dressed would stand out like an overcoat on the beach. But we'll see." He gave orders to one of his assistants.

The President resumed studying the map. "So far as we know," he said, pointing to Grinnell, Iowa, "all this derives from a single landing, here."

The Old Man answered, "Yes—so far as we know."

I said, "Oh, no!"

They all looked at me and I was embarrassed. "Go ahead," said the President.

"There were at least three more landings—I know there were—before I was rescued."

The Old Man looked dumbfounded. "Are you sure, son? We thought we had wrung you dry."

"Of course I'm sure."

"Why didn't you mention it?"

"I never thought of it before." I tried to explain how it feels to be possessed, how you know what is going on, but everything seems dreamy, equally important and equally unimportant. I grew quite upset. I am not the jittery type, but being ridden by a master does something to you.

The Old Man put his hand on me and said, "Steady down, son." The President said something soothing and gave me a reassuring smile. That stereocast personality of his is not put on; he's really got it.

Rexton said, "The important point is: where did they land? We might still capture one."

"I doubt it," the Old Man answered. "They did a coverup on the first one in a matter of hours. If it was the first one," he added thoughtfully.

I went to the map and tried to think. Sweating, I pointed to New Orleans. "I'm pretty sure one was about here." I stared at the map. "I don't know where the others landed. But I know they did."

"How about here?" Rexton asked, pointing to the East Coast.

"I don't know. I don't know."

The Old Man pointed to the other East Coast danger spot. "We know this one is a secondary infection." He was kind enough not to say that I had been the means of infecting it.

"Can't you remember anything else?" Martinez said testily. "Think, man!"

"I just don't know. We never knew what they were up to, not really." I thought until my skull ached, then pointed to Kansas City. "I sent several messages here, but I don't know whether they were shipment orders, or not."

Rexton looked at the map; around Kansas City was almost as pin-studded as Iowa. "We'll assume a landing near Kansas City, too. The technical boys can do a problem on it. It may be subject to logistic analysis; we might derive the other landing."

"Or landings," added the Old Man.

"Eh? 'Or landings'. Certainly. But we need more reports." He turned back to the map and stared at it thoughtfully.

XVI

Hindsight is confoundedly futile. At the moment the first saucer landed the menace could have been stamped out by one determined man and a bomb. At the time "The Cavanaughs"—Mary, the Old Man, and I—reconnoitered around Grinnell and in Des Moines, we three alone might have killed every slug had we been ruthless and, more important, known where they all were.

Had Schedule Bare Back been ordered during the fortnight after the first landing it alone might have turned the trick. But by the next day it was clear that Schedule Bare Back had failed as an offensive measure. As a defense it was useful; the uncontaminated areas could be kept so, as long as the slugs could not conceal themselves. It had even had mild success in offense; areas contaminated but not "secured" by the parasites were cleaned up at once . . . Washington itself, for example, and New Philadelphia. New Brooklyn, too—there I had been able to give specific advice. The entire East Coast turned from red to green.

But as the area down the middle of the country filled in on the map, it filled in red, and stayed so. The infected areas stood out in ruby light now, for the simple wall map studded with push pins had been replaced by a huge electronic military map, ten miles to the inch, covering one wall of the conference room. It was a repeater map, the master being located down in the sublevels of the New Pentagon.

The country was split in two, as if a giant had washed red pigment down the Central Valley. Two zigzag amber paths bordered the great band held by the slugs; these were overlap, the only areas of real activity, places where line-of-sight reception was possible from both stations held by the enemy and from stations still in the hands of free men. One such started near Minneapolis, swung west of Chicago and east of St. Louis, then meandered through Tennessee and Alabama to the Gulf. The other cut a wide path through the Great Plains and came out near Corpus Christi. El Paso was the center of a ruby area as yet unconnected with the main body.

I looked at the map and wondered what was going on in those border strips. I had the room to myself; the Cabinet was meeting and the President had taken the Old Man with him. Rexton and his brass had left earlier. I stayed there because I had not been told where to go and I hesitated to wander around in the White House. So I stayed and fretted and watched amber lights blink red and, much less frequently, red lights blink amber or green.

I wondered how an overnight visitor with no status managed to get breakfast? I had been up since four and my total nourishment so far had been one cup of coffee, served by the President's valet. Even more urgently I wanted to find a washroom. I knew where the President's washroom was, but I did not have the nerve to use it, feeling vaguely that to do so would be somewhere between high treason and disorderly conduct.

There was not a guard in sight. Probably the room was being scanned from a board somewhere; I suppose every room in the White House has an "eye & ear" in it; but there was no one physically in view.

At last I got desperate enough to start trying doors. The first two were locked; the third was what I was looking for. It was not marked "Sacred to the Chief" nor did it appear to be booby-trapped, so I used it.

When I came back into the conference room, Mary was there.

I looked at her stupidly for a moment. "I thought you were with the President?"

She smiled. "I was, but I got chased out. The Old Man took over for me."

I said, "Say, Mary, I've been wanting to talk with you and this is the first chance I've had. I guess I—Well, anyway, I shouldn't have, I mean, according to the Old Man—" I stopped, my carefully rehearsed speech in ruins. "Anyhow, I shouldn't have said what I did," I concluded miserably.

She put a hand on my arm. "Sam. Sam, my very dear, do not be troubled. What you said and what you did was fair enough from what you knew. The important thing, *to me*, is what you did *for me*. The rest does not matter—except that I am happy again to know that you don't despise me."

"Well, but—Damn it, don't be so noble! I can't stand it!"

She gave me a merry, lively smile, not at all like the gentle one with which she had greeted me. "Sam, I think you *like* your women to be a little bit bitchy. I warn you, I can be so." She went on, "You are still worried about that slap, too, I think. All right, I'll pay it back." She reached up and patted me gently on the cheek, once. "There, it's paid back and you can forget it."

Her expression suddenly changed, she swung on me—and I thought the top of my head was coming off. "And that," she said in a tense, hoarse whisper, "pays you back the one I got from your girlfriend!"

My ears were ringing and my eyes did not want to focus. If I had not seen her bare palm, I would have sworn that she had used at least a two-by-four.

She looked at me, wary and defiant, not the least apologetic—angry, rather, if dilated nostrils meant anything. I raised a hand and she tensed—but I just wanted to touch my stinging cheek. It was very sore. "She's not my girlfriend," I said lamely.

We eyed each other and simultaneously burst out laughing. She put both her hands on my shoulders and let her head collapse on my right one, still laughing. "Sam," she managed to say, "I'm so sorry. I shouldn't have done it—not to you, Sam. At least I shouldn't have slapped you so hard."

"The devil you're sorry," I growled, "but you shouldn't have put English on it. You damn near took the hide off."

"Poor Sam!" She reached up and touched it; it hurt. "She's really not your girlfriend?"

"No, worse luck. But not from lack of my trying."

"I'm sure it wasn't. Who is your girlfriend, Sam?" The words seem coquettish; she did not make them so.

"You are, you vixen!"

"Yes," she said comfortably, "I am—if you'll have me. I told you that before. And I meant it. Bought and paid for."

She was waiting to be kissed; I pushed her away. "Confound it, woman, I don't want you 'bought and paid for'."

It did not faze her. "I put it badly. Paid for—but not bought. I'm here because I want to be here. Now will you kiss me, please?"

So help me, up to that moment she had not turned on the sex, not really. When she saw that the answer was yes, she did so and it was like summer sun coming out from a cloud. That is inadequate but it will have to do.

She had kissed me once before; this time she *kissed* me. The French are smart; they have two words for it . . . this was the other one. I felt myself sinking into a warm golden haze and I did not ever want to come up.

Finally I had to break and gasped. "I think I'll sit down for a minute."

She said, "Thank you, Sam," and let me.

"Mary," I said presently, "Mary, my dear, there is something you possibly could do for me."

"Yes?" she said eagerly.

"Tell me how in the name of Ned a person gets anything to eat around here? I'm starved. No breakfast."

She looked startled; I suppose she had expected something else. But she answered, "Why, certainly!"

I don't know where she went nor how she did it. She may have butted into the White House pantry and helped herself. But she returned in a few minutes with a tray of sandwiches and two bottles of beer. Corned beef and rye put the roses back in my cheeks. I was cleaning up my third when I said, "Mary, how long do you figure that meeting will last?"

"Let me see," she answered, "fourteen people, including the Old Man. I give it a minimum of two hours. Why?"

"In that case," I said, swallowing the last bite, "we have time to duck out of here, find a registry office, get married, and get back before the Old Man misses us."

She did not answer and she did not look at me. Instead she stared at the bubbles in her beer. "Well?" I insisted.

She raised her eyes. "I'll do it if you say so. I'm not welshing. But I'm not going to start out by lying to you. I would rather we didn't."

"You don't want to marry me?"

"Sam, I don't think you are ready to get married."

"Speak for yourself!"

"Don't be angry, my dear. I'm not holding out—honest. You can have me with or without a contract, anywhere, anywhen, anyway. But you don't know me yet. Get acquainted with me; you might change your mind."

"I'm not in the habit of changing my mind." She glanced up without answering, then looked away sadly. I felt my face get hot. "That was a very special circumstance," I protested. "It could not happen to us again in a hundred years. That wasn't really me talking; it was—"

She stopped me. "I know, Sam. And now you want to prove to me that it didn't really happen or at least that you are sure of your own mind now. But you don't have to prove anything. I won't run out on you and I don't mistrust you. Take me away on a weekend; better yet, move into my apartment. If you find that I wear well, there's always time to make me what great grandmother called an 'honest woman', heaven knows why."

I must have looked sullen; I felt so. She put a hand on mine and said seriously, "Take a look at the map, Sam."

I turned my head and looked. Red as ever, or more so—it seemed to me that the danger zone around El Paso had increased. She went on, "Let's get this mess cleaned up first, dear. Then, if you still want to, ask me again. In the meantime, you can have the privileges without the responsibilities."

What could be fairer than that? The only trouble was that it was not the way I wanted it. Why will a man who has been avoiding marriage like the plague suddenly decide that nothing less will suit him? I had seen it happen a hundred times and never understood it; now I was doing it myself.

Mary had to go back on duty as soon as the meeting was over. The Old Man collared me and took me for a walk. Yes, a walk, though we went only as far as the Baruch Memorial Bench. There he sat down, fiddled with his pipe, and stared into space. The day was as muggy as only Washington can get, but the park was almost deserted. People were not yet used to Schedule Bare Back.

He said, "Schedule Counter Blast starts at midnight."

I said nothing; questioning him was useless.

Presently he added, "We swoop down on every relay station, broadcast station, newspaper office, and Western Union office in 'Zone Red'."

"Sounds good," I answered. "How many men does it take?"

He did not answer; instead he said, "I don't like it. I don't like it a little bit."

"Huh?"

"See here, bub—the President went on the channels and told everybody to peel off their shirts. We find that the message did not get through into infected territory. What's the next logical development?"

I shrugged. "Schedule Counter Blast, I suppose."

"That hasn't happened yet. Think—it has been more than twenty-four hours: what should have happened and hasn't?"

"Should I know?"

"You should, if you are ever going to amount to anything on your own. Here—" He handed me a combo key. "Scoot out to Kansas City and take a looksee. Stay away from comm stations, cops, and—shucks, you know their attack points better than I do. Stay away from *them*. Take a look at anything else. And don't get caught." He looked at his finger and added, "Be back here a half hour before midnight, or sooner. Get going."

"A lot of time you allow me to case a whole city," I complained. "It will take nearly three hours just to drive to Kansas City."

"More than three hours," he answered. "Don't attract attention by picking up a ticket."

"You know dam well I'm a careful driver."

"Move."

So I moved, stopping by the White House to pick up my kit. I wasted ten minutes convincing a new guard that I really had been there overnight and actually had possessions to pick up.

The combo was to the car we had come down in; I picked it up at Rock Creek Park platform. Traffic was light and I commented on it to the dispatcher as I handed in the combo. "Freight and commercial carriers are grounded," he answered. "The emergency—you got a military clearance?"

I knew I could get one by phoning the Old Man, but bothering him about minutiae does not endear one to him. I said, "Check the number."

He shrugged and slipped the combo in his machine. My hunch had been right; his eyebrows shot up and he handed it back. "How you rate!" he commented. "You must be the President's fair-haired boy."

He did not ask for my destination and I did not offer it. His machine probably broke into "Hail, Columbia!" when the Old Man's number hit it.

Once launched, I set the controls for Kansas City at legal max and tried to think. The transponder beeped as radar beams hit it each time I slid from one control block into the next, but no faces appeared on the screen. Apparently the Old Man's combo was good for the route, emergency or not.

I began to wonder what would happen when I slipped over into the red areas—and then realized what he had been driving at when he talked about "the next logical development". Would the control net pass me on through into areas we knew darn well were infested by titans?

One tends to think of communications as meaning the line-of-sight channels and nothing else. But "communications" means all traffic of every sort, even dear old Aunt Mamie, headed for California with her head stuffed with gossip. The slugs had seized the channels and the President's proclamation had not gotten through, or so we assumed—but news can't be stopped that easily; such measures merely slow it down. Behind the Soviet Curtain Aunt Sonya does not go on long trips; it ain't healthy. Ergo, if the slugs expected to retain control where they were, seizing the channels would be just their first step.

It stood to reason that they were not numerous enough to interfere with *all* traffic, but what would they do?

I reached only the unhelpful conclusion that they would do something and that I, being a part of "communications" by definition, had better be prepared for evasive action if I wanted to save my pretty pink skin.

In the meantime the Mississippi River and Zone Red were sliding closer by the minute. I wondered what would happen the first time my recognition signal was picked up by a station controlled by masters. I tried to think like a titan—impossible, I found, even though I had been a slave to one. The idea revolted me.

Well, then, what would a security commissar do if an unfriendly craft flew past the Curtain? Have it shot down, of course. No, that was not the answer; I was probably safe in the air.

But I had better not let them spot me landing. Elementary.

"Elementary" in the face of a traffic control net which was described proudly as the No-Sparrow-Shall-Fall plan. They boasted that a butterfly could not make a forced landing anywhere in the United States without alerting the search & rescue system. Not quite true—but I was no butterfly.

What I wanted was to land short of the infested area and go in on the ground. On foot I will make a stab at penetrating any security screen, mechanical, electronic, manned, or mixed. But how can you use misdirection in a car making westing a full degree every seven minutes? Or hang a stupid, innocent look on the nose of a duo?

If I went in on foot the Old Man would get his report come next Michaelmas; he wanted it before midnight.

Once, in a rare mellow mood, the Old Man told me that he did not bother his agents with detailed instructions—give a man a mission; let him sink or swim. I suggested that his method must use up a lot of agents.

"Some," he had admitted, "but not as many as the other way. I believe in the individual and I try to pick individuals who are survivor types."

"And how in the hell," I had asked him, "do you know when you've got a 'survivor type'."

He had grinned at me wickedly. "A survivor type is an agent who comes back. Then I know."

I had to reach a decision in the next few minutes. Elihu, I said to myself, you are about to find out which type you are—and damn his icy heart!

My course would take me in toward St. Louis, swing me in the city loop around St. Louis, and on to Kansas City. But St. Louis was in Zone Red. The military-situation map had showed Chicago as still green; as I remembered it the amber line had zigzagged west somewhere above Hannibal, Missouri—and I wanted very badly to cross the Mississippi while still in Zone Green. A car crossing that mile-wide river would make a radar blip as sharp as a desert star.

I signaled block control for permission to descend to local-traffic level, then did so without waiting, resuming manual control and cutting my speed. I headed north.

Short of the Springfield loop I headed west again, staying low.

When I reached the river I crossed slowly, close to the water, with my transponder shut down. Sure, you can't shut off your radar recognition signal in the air, not in a standard rig—but the Section's cars were not standard. The Old Man was not above using gangster tricks.

I had hopes, if local traffic were being monitored while I crossed, that my blip would be mistaken for a boat on the river. I did not know certainly whether the next block station across the river was Zone Red or Zone Green, but, if my memory was correct, it should be green.

I was about to cut in the transponder again on the assumption that it would be safer, or at least less conspicuous, to get back into the traffic system when I noticed the shoreline opening up ahead of me. The map did not show a tributary there; I judged it to be an inlet, or possibly a new channel cut in the spring floods and not yet mapped. I dropped almost to water level and headed into it. The stream was narrow, meandering, and almost overhung by trees and I had no more business taking a sky car into it than a bee has of flying down a trombone—but it afforded perfect radar "shadow"; I could get lost in it.

In a few minutes I *was* lost, not only from any monitoring technician, but lost myself, right off the map. The channel switched and turned and cut back and I was so busy bucking the car by hand, trying to keep from crashing that I lost all track of navigation. I swore and wished that the car were a triphib so that I could land on water.

The trees suddenly broke on the left bank; I saw a stretch of level land, kicked her over and squatted her in with a deceleration that nearly cut me in two against my safety belt. But I was down and no longer trying to play catfish in a muddy stream.

I wondered what to do. There seemed to be nobody around; I judged that I was on the back end of someone's farm. No doubt there was a highway close by. I had better find it and stay on the ground.

But I knew that was silly even as I thought it. Three hours from Washington to Kansas City by air—I had completed almost all the trip and now I was how far away from Kansas City? By land, about *three hours*. At that rate, all I needed to make the trip complete was to park the car ten or twelve miles outside Kansas City and walk; then I would *still* have three hours to go.

I felt like the frog who jumped halfway to the end of the log with each hop, but never got there. I *must* get back into the air.

But I did not dare do so until I knew positively whether traffic here was being controlled by free men, or by slugs.

It suddenly occurred to me that I had not turned on the stereo since leaving Washington. I am not much for stereo; between the commercials and the junk they sandwich between them I sometimes wonder about "progress". But a newscast may have uses.

I could not find a newscast. I got (a) a lecture by Myrtle Doolightly, Ph.D., on *Why Husbands Grow Bored,* sponsored by the Uth-a-gen Hormone Company—I decided that she probably had plenty of experience in her subject; (b) a trio of girl hepsters singing *If You Mean What I think You Mean, What are We Waiting For?* (c) an episode in *Lucretia Learns About Life*.

Dear Doctor Myrtle was fully dressed and could have hidden half a dozen titans around her frame. The trio were dressed about the way one would expect them to be, but they did not turn their backs to the camera. Lucretia appeared to alternate having her clothes torn off with taking them off willingly, but the camera always cut or the lights always went out just before I could check on whether or not her back was bare—of slugs, that is.

And none of it meant anything. Those programs could have been taped weeks or months before the President announced Schedule Bare Back. I was still switching channels, trying to find a newscast—or any live program—when I found myself staring into the professionally unctuous smile of an announcer. He was fully dressed.

Shortly I realized it was one of those silly giveaway shows. He was saying: "—and some lucky little woman sitting by her screen right this minute is about to receive, absolutely free, a General Atomics Six-in-One Automatic Home Butler. Who will it be? You? You? Or lucky *you*? He turned away from scan; I could see his shoulders. They were covered by shirt and jacket and distinctly rounded, almost humped. I was inside Zone Red.

When I switched off I realized that I was being watched—by a male urchin about nine years old. He was wearing nothing but shorts, but the brown of his shoulders showed that such was his custom. I threw back the windscreen. "Hey, bub, where's the highway?"

He continued to stare before replying, "Road to Macon's up there yonder. Say, mister, that's a Cadillac Zipper, ain't it?"

"Sure thing. Where yonder?"

"Give me a ride, huh, will you?"

"Haven't got time. Where's the road?"

He sized me up before answering, "Take me along and I'll show you."

I gave in. While he climbed in and looked around, I opened my kit, got out shirt, trousers, and jacket, and put them on. I said conversationally, "Maybe I shouldn't put on this shirt. Do people around here wear shirts?"

He scowled. "I've got shirts!"

"I didn't say you didn't; I just asked if people around here wore shirts."

"Of course they do. Where do you think you are, mister; Arkansas?"

I gave up and asked again about the road. He said, "Can I punch the button when we take off, huh?"

I explained that we were going to stay on the ground. He was frankly annoyed but condescended to point out a direction. I drove cautiously as the car was heavy for unpaved countryside. Presently he told me to turn. Quite a bit later I stopped the car and said, "Are you going to show me where that road is, or am I going to wallop your backsides?"

He opened the door and slid out. "Hey!" I yelled.

He looked back. "Over that way," he admitted. I turned the car, not really expecting to find a highway, but finding one, nevertheless, only fifty yards away. The brat had caused me to drive around three sides of a large square.

If you could call it a highway—there was not an ounce of rubber in the paving. Still, it was a road; I followed it to the west. All in all, I had wasted more than an hour.

Macon, Missouri seemed normal—much too normal to be reassuring, as Schedule Bare Back obviously had not been heard of here. There were a number of bare backs, but it was a hot day. There were more backs that were covered and any of them might have concealed a slug. I gave serious thought to checking this town, rather than Kansas City, then beating back the way I had come, while I could. Pushing further into country which I knew to be controlled by the masters made me as nervous as a preacher at a stag party; I wanted to run.

But the Old Man had said "Kansas City"; he would take a dim view of a substitute. Finally I drove the belt around Macon and pulled into a landing flat on the far side. There I queued up for local traffic launching and headed for Kansas City in a mess of farmers' copters and suchlike local craft. I would have to hold local speeds all across the state, but that was safer than getting into the hot pattern with my transponder identifying my car to every block control station.

The field was automatically serviced, no attendants, not even at the fuelling line. It seemed probable that I had managed to enter the Missouri traffic pattern without arousing suspicion. True, there was a block control station back in Illinois which might be wondering where I had gone, but that did not matter.

XVII

Kansas City is an old-fashioned city; it was not hurt in the bombings; except on the East Side where Independence used to be.

Consequently, it was never rebuilt. From the southeast you can drive almost downtown, as far as Swope Park, without having to choose between parking or paying toll to enter the city proper.

One can fly in and make another choice: land in the landing flats north of the Missouri River and take the tunnels into the city, or land on the downtown platforms south of Memorial Hill.

I decided against both of these; I wanted the car near me but I did not want to have to pick it up through a checking system. If it came to a pinch, I could not shoot my way out while offering my combo to a parking attendant. I did not like tunnels in a pinch, either—nor launching platform elevators. A man can be trapped in such.

Frankly I did not want to go into the city at all.

I roaded the car on Route 40 and drove into the Meyer Boulevard toll gate. The line waiting to pay toll for the doubtful privilege of driving on a city street was quite long; I began to feel hemmed in as soon as another car filled in behind me and wished mightily that I had decided to park and go in by the public passenger ways. But the gatekeeper took my toll without glancing at me. I glanced at him, all right, but could not tell whether or not he was being ridden.

I drove through the gate with a sigh of relief—only to be stopped just beyond the gate. A barrier dropped in front of me and I just managed to stop the car, whereupon a cop stuck his head in the side I had open. "Safety check," he said. "Climb out."

I protested that my car had just been inspected. "No doubt," he agreed, "but the city is having a safety drive. Here's your car check. Pick it up just beyond the barrier. Now get out and go in that door." He pointed to a low building a few steps from the curb.

"What for?"

"Eyesight and reflexes," he explained. "Come on. You're holding up the line."

In my mind's eye, I saw the map, with Kansas City glowing red. That the city was "secured" I was sure; therefore this mild-mannered policeman was almost surely hag-ridden. I did not need to look at his shoulders.

But, short of shooting him and making an emergency takeoff from that spot, there was nothing I could do but comply. With a normal, everyday cop I would have tried the bribe direct, slipping him money as he handed me my car check. But titans don't use money.

Or do they?

I got out, grumbling, and walked slowly toward the building. The door near me was marked "IN"; there was one at the far end marked "OUT"; a man came out from it as I approached. I wanted very badly to ask him what he had found.

It was a temporary building with an oldstyle unpowered door. I pushed it open with a toe and glanced both sides and up before I entered. It seemed safe. Inside was an empty anteroom with open door beyond.

Someone inside called out, "Come in." Still as cautious as the setup permitted, I went in.

There were two men, both in white coats, one with a doctor's speculum strapped to his head. He looked up and said briskly, "This won't take a minute. Step over here." He closed the door I had entered; I heard the latch click.

It was a sweeter setup than we had worked out for the Constitution Club; had I had time I would have admired it. Spread out on a long table were transit cells for masters, already opened and warmed. The second man had one ready—for me, I knew—and was holding it tilted toward him, so that I could not see the slug inside. The transit cells would not arouse alarm in the minds of victims; medical men always have things at hand which are odd to the layman.

As for the rest, I was being invited to place my eyes against the goggles of a quite ordinary visual acuity tester. The "doctor" would keep me there, blindfolded without knowing it and reading test figures, while his "assistant" fitted me with a master. No violence, no slips, no protests.

It was not even necessary, as I had learned during my own "service", to bare the victim's back. Just touch the master to the bare neck, then let the new recruit himself adjust his clothing to cover his master before he left.

"Right over here," the "doctor" repeated. "Place your eyes against the eyepieces."

Moving very quickly I went to the bench on which was mounted the acuity tester and started to comply. Then I turned suddenly around.

The assistant had moved in closer: the cell was ready in his hands. As I turned he tilted it away from me. "Doctor," I said, "I wear contact lenses. Should I take them off?"

"No, no," he snapped. "Let's not waste time."

"But, Doctor," I protested, "I want you to see how they fit. Now I've had a little trouble with this left one—" I lifted both hands and pulled back the upper and lower lids of my left eye. "See?"

He said angrily, "This is not a clinic. Now, if you please—" They were both within reach; lowering my arms in a mighty bear hug I got them both—and grabbed with clutched fingers at the spot between each set of shoulder blades. With each hand I struck something soft and mushy under the coats and felt revulsion shake me at the touch.

Once I saw a cat struck by a ground car; the poor thing leapt straight up about four feet with its back arched the wrong way and all limbs flying. These two unlucky men did the same sort of thing; they contorted in every muscle in a grand spasm as if every motor cell in each body had been stimulated at once.

Which is perhaps just what happened when I clutched and crushed their masters.

I could not hold them; they jerked out of my arms and flopped to the floor. But there was no need to hold them; after that first boneshaking convulsion they went limp, unconscious, possibly dead.

Someone was knocking at the door. I called out, "Just a moment. The doctor is busy." The knocking stopped. I made sure that the door was fastened, then went back, bent over the "doctor" and pulled up his coat to see what I had done to his master.

The thing was a ruptured, slimy mess, already beginning to stink. So was the one on the other man—which facts pleased me heartily as I was determined to burn the slugs if they were not already dead and I was not sure that I could do so without killing the hosts as well. I left the men, to live or die—or be seized again by titans, as might be. I had no way to help them.

The masters waiting in their cells were another matter. With a fan beam and a max charge I burned them all in seconds only. There were two large crates against the wall. I did not know that they contained masters but I had no reason to believe otherwise; I beamed them through and through until the wood charred.

The knocking at the door resumed. I looked around hastily for somewhere to hide the two men. There was nowhere at all, so I decided to execute the classic military maneuver. As I was about to go out the exit, I felt that something was missing. I hesitated and looked around again.

The room was almost bare; there seemed to be nothing suited to my purpose. I could use clothing from the "doctor" or his helper, but I did not want to touch them. Then I noticed the dust cover for the acuity tester lying on the bench. I loosened my shirt, snatched up the dust cover, wadded it up, and stuffed it under my shirt between my shoulder blades. With my shirt collar fastened and my jacket zipped tightly it made a bulge of the proper size.

Then I went out, "—a stranger and afraid, into a world I never made."

As a matter of fact I was feeling pretty cocky.

Another cop took my car check. He glanced sharply at me, then motioned me to climb in. I did so and he said, "Go to police headquarters, under the City Hall."

" 'Police headquarters, the City Hall'," I repeated and gunned her ahead. I started in that direction and turned onto Nichols Freeway. I came to a stretch where traffic thinned out and punched the button to shift license plates, hoping that no one would notice. It seemed possible that there was already a call out for the plates I had been showing at the toll gate. I wished that I had been able to change the car's colors and body lines as well.

Before the freeway reached Magee Traffic Way, I turned into a down ramp and stuck thereafter to residential side streets. It was eighteen hundred, zone six time, and I was due in Washington in four and one-half hours.

XVIII

The city did not look right. I tried to discount my own keyed-up state and to see what was actually there—not what I expected to see nor what I was expected to see. Superficially there was nothing wrong, but it did not have the right flavor, as if it were a clumsily directed play. I kept trying to put my finger on it; it kept slipping away.

Kansas City has many wide neighborhoods made up of family units a century old or more. Time seems to have passed them by; kids roll on lawns and householders sit in the cool of the evening on their front porches, just as their great-grandparents did. If there are bomb shelters around, they do not show. The queer, old, bulky houses, fitted together piece by piece by guildsmen long since dead, have homely charm. Seeing them, one wonders how Kansas City got its gamy reputation; those old neighborhoods feel like an enclave of security, impregnable, untouchable.

I cruised through, dodging dogs and rubber balls and toddlers who chased after each, and tried to get the feel of the place. It was the slack of the day, time for the first drink, for watering lawns, and for neighborly chatting.

And so it seemed. Ahead of me I saw a woman bending over a flower bed. She was wearing a sun suit and her back was bare as mine—more so, for I had that wad of cloth stuffed under my jacket. But clearly she was not wearing a master, nor were the two young kids with her. So what could be wrong?

It was a hot day, hotter even than Washington had been; I began to look for bare shoulders, sun-suited women and men in shorts and sandals. Kansas City, despite its reputation, is in the Bible Belt and feels its puritanical influence. People there do not strip to the weather with the cheerful unanimity of Laguna Beach or Coral Gables. An adult fully covered up is never conspicuous, even on the hottest day.

So I found people dressed both ways—but the proportions were wrong. Sure, there were plenty of kids dressed for the weather, but in several miles of driving I saw the bare backs of only five adult women and two adult men.

I should have seen more like five hundred. It was a *hot* day.

Cipher it out. While some jackets undoubtedly did *not* cover masters, by simple proportion *well over ninety percent of the population must be possessed.*

This city was not "secured" the way we had secured New Brooklyn; this city was *saturated.* The masters did not simply hold key points and key officials; the masters *were* the city.

I felt a panicky urge to blast off right from the street and streak out of Zone Red at emergency maximum. They knew that I had escaped the toll gate trap; they would be looking for me. I might be the only free man driving a car in the entire city—and they were all around me!

I fought it down. An agent who gets the wind up is no use to himself or his boss and is not likely to get out of a tight spot. But I had not fully recovered from what it had done to me to be possessed; it was hard to be calm.

I counted ten, delayed my reactions, and tried to figure the situation. It seemed that I must be wrong; there could not possibly be enough masters available to permit them to saturate a city with a million population. I remembered my own experiences hardly two weeks earlier; I recalled how we picked our recruits and made each new host count. Of course that had been a secondary invasion in which we had depended on shipments, whereas Kansas City almost certainly had had a flying saucer land nearby.

Still it did not make sense; it would have taken, I felt sure, not one saucer but a dozen or more, to carry enough masters to saturate Kansas City. If there had been that many surely the space stations would have spotted them, radar-tracked their landing orbits.

Or could it be that they had no trajectories to track? That they simply appeared instead of swooping down like a rocket? Maybe they used that hypothetical old favorite, the "spacetime warp"? I did not know what a spacetime warp was and I doubted if anyone knew, but it would do to tag a type of landing which could not be spotted by radar. We did not know what the masters were capable of in the way of engineering and it was not safe to judge their limitations by our own.

But the data I had led to a conclusion which contradicted common logic; therefore I must check before I reported back. One thing seemed sure: if I assumed that the masters had in fact almost saturated this city, then it was evident that they were still keeping up the masquerade. For the time being they were permitting the city to look like a city of free human beings. Perhaps I was not as conspicuous as I feared.

While I was thinking I had moseyed along another mile or so, going nowhere. Once I found myself heading into the retail district around the Plaza; I swung away; where there are crowds, there are cops. But I skimmed the edge of the district and in so doing passed a public swimming pool. I observed it and filed what I had seen. My mind works by delays and priorities; an item having a low priority is held until the circuits are cleared and ready for it.

To put it bluntly, I am subject to doubletakes.

I was several blocks away before I reviewed the swimming pool datum; it had not been much: the gates were locked and it carried a sign—"CLOSED FOR THE SEASON".

A swimming pool closed down during the hottest part of the summer? What did it mean? Nothing at all; swimming pools have gone out of business before and will again. On the other hand it was contrary to the logic of economics to close such an enterprise during the season of greatest profit except through utter necessity. The odds against it were long.

But a swimming pool was the one place where the masquerade could not possibly be maintained. From the viewpoint of humans a closed pool was less conspicuous than a pool unpatronized in hot weather. And I knew that the masters noted and followed the human point of view in their maneuvers—shucks, I had been there!

Item: a trap at the city's toll gates; item: too few sun suits; item: a closed swimming pool.

Conclusion: the slugs were incredibly more numerous than had been dreamed by anyone—including myself who had been possessed by them.

Corollary: Schedule Counter Blast was based on a mistaken estimate of the enemy and would work as well as hunting rhinoceri with a slingshot.

Counter argument: what I thought I saw was physically impossible. I could hear Secretary Martinez's restrained sarcasm tearing my report to shreds. My guesses referred only to Kansas City and were insufficiently grounded even there. Thank you kindly for your interest but what you need is a long rest and freedom from nervous strain. Now, gentlemen—

Pfui!

I had to have something strong enough for the Old Man to convince the President over the reasonable objections of his official advisers—and I had to have it right away. Even with a total disregard of traffic laws I could not clip much off two and a half hours running time back to Washington.

What could I dig up that would be convincing? Go farther downtown, mingle with crowds, and then tell Martinez that I was sure that almost every man I passed was possessed? How could I prove it? For that matter, how could I myself be certain; I did not have Mary's special talent. As long as the titans kept up the farce of "business as usual" the telltales would be subtle, a superabundance of round shoulders, a paucity of bare ones.

True, there was the toll gate trap. I had some notion now of how the city had been saturated, granting a large enough supply of slugs. I felt sure that I would encounter another such trap on the way out and that there would be others like it on launching platforms and at every other entrance and exit to the city proper. Every person leaving would be a new agent for the masters; every person entering would be a new slave.

This I felt sure of without being inclined to test it by visiting a launching platform. I had once set up such a trap in the Constitution Club; no one who entered it had escaped.

I had noticed a vendo-printer for the *Kansas City Star* on the last corner I had passed. Now I swung around the block and came back to it, pulled up, and got out. I shoved a dime in the slot and waited for my paper to be printed. It seemed to take unusually long, but that was my own nervousness, I felt that every passer-by was staring at me.

The *Star's* format had its usual dull respectability-no excitement, no mention of an emergency, no reference to Schedule Bare Back. The lead news story was headed PHONE SERVICE DISRUPTED BY SUNSPOT STORM, with a subhead *City Semi-Isolated by Solar Static*. There was a 3-col, semi-stereo, trukolor of the sun, its face disfigured by cosmic acne. The pic carried a Palomar date line, as did one of the substories.

The picture was a good fake—or perhaps they pulled a real one out of the paper's library. It added up to a convincing and unexciting explanation of why Mamie Schultz, herself free of parasites, could not get her call through to Grandma in Pittsburgh.

The rest of the paper looked normal. I tucked it under my arm to study later and turned back to my car . . . just as a police car glided silently up and cramped in across the nose of it. A cop got out.

A police car seems to condense a crowd out of air. A moment before the corner was deserted—else I would never have stopped. Now there were people all around and the cop was coming toward me. My hand crept closer to my gun; I would have dropped him had I not been sure that most, if not all, of those around me were equally dangerous.

He stopped in front of me. "Let me see your license," he said pleasantly.

"Certainly, officer," I agreed, "It's clipped to the instrument board of my car." I stepped past him, letting it be assumed that he would follow me. I could feel him hesitate, then take the bait. I led him around to the far side, between my car and his. This let me see that he did not have a mate in his car, a most welcome variation from human practice. More important, it placed my car between me and the too-innocent bystanders.

"Right there," I said, pointing inside, "it's fastened down." Again he hesitated, then looked—just long enough for me to use the new technique I had developed through necessity. My left hand slapped down on his shoulders and I clutched with all my strength.

It was the "struck cat" all over again. His body seemed to explode so violent was the spasm. I was in the car and gunning it almost before he hit the pavement.

And none too soon. The masquerade broke as suddenly as it had in Barnes's outer office; the crowd closed in. One young woman clung by her nails to the smooth outside of the car for fifty feet or more before she fell off. By then I was making speed and still accelerating. I cut in and out of oncoming traffic, ready to take to the air but lacking space.

A cross street showed up on the left; I slammed into it. It was a mistake; trees arched over it and I could not take off. The next turn was even worse; I cursed the city planners who had made Kansas City so parklike.

Of necessity I slowed down. Now I was cruising at a conservative city speed, still watching for a street which would carry me to some boulevard wide enough for an illegal takeoff. My thoughts began to catch up with me and I realized that there was no sign of pursuit. My own too-intimate knowledge of the masters came to my aid. Except for "direct conference" a titan lives in and through his host; he sees what the host sees; receives and passes on information through whatever organs and by whatever means are available to the host.

I knew that. So I knew that it was unlikely that any of the slugs at the corner had been looking for that particular car other than the one inhabiting the body of a policeman—and I had settled with it!

Now, of course, the other parasites present would be on the lockout for me, too—but they had only the bodily abilities and facilities of their hosts. I decided that I need treat them with no more respect, or only a little more respect, than I would give to any casual crowd of witnesses, i.e., ignore them; change neighborhoods and forget it.

For I had nearly thirty minutes of grace left and I had decided what it was I needed as proof; a prisoner, a man who had been possessed and could tell what had happened to the city. I had to rescue a host.

I had to capture a man who was possessed, capture him without hurting him, kill or remove his rider, and kidnap him back to

Washington. I had not time to pick a victim, to make plans; I must act *now*. Even as I decided, I saw a man walking in the block ahead. He was carrying a briefcase and stepping along like a man who sees home and supper ahead. I pulled alongside him and said, "Hey!"

He stopped. "Eh?"

I said, "I've just come from City Hall. No time to explain—slide in here and we'll have a direct conference."

He answered, "City Hall? What are you talking about?"

I said, "Change in plans. Don't waste time. Get in!"

He backed away. I jumped out of the car and grabbed at his hunched shoulders.

Nothing happened—nothing, save that my hand struck bony human flesh, and the man began to yell.

I jumped back into the car and got out of there fast. When I was blocks away I slowed and thought it over. Could it be that I was wrong, that my nerves were so overwrought that I saw signs of titans where there were none?

No! For the moment I had the Old Man's indomitable will to face facts, to see them as they were. The toll gate, the sun suits, the swimming pool, the cop at the vendo-printer . . . those facts I *knew*—and this last fact simply meant that I had hit the double-zero, rolled boxcars, picked the one man in ten, or whatever the odds were, who was not yet recruited. I speeded up, looking for a new victim.

He was a middle-aged man watering his lawn, a figure so bucolic and out-of-this-century that I was half a mind to pass him by. But I had no time left—and he wore a heavy sweater which bulged suspiciously. Had I seen his wife on the veranda I would have gone past, for she was dressed in bra and skirt and so could not have been possessed.

He looked up inquiringly as I stopped. "I've just come from City Hall," I repeated. "You and I need a direct conference right away. Get in."

He said quietly, "Come in the house for it. That car is too public."

I wanted to refuse but he had already turned and was heading for the house. As I came up by him he whispered, "Careful. The woman is not of us."

"Your wife?"

"Yes."

We stopped on the porch and he said, "My dear, this is Mr. O'Keefe. We have some business to discuss. We'll be in the study."

She smiled and answered, "Certainly, my love. Good evening, Mr. O'Keefe. Sultry, isn't it?"

I agreed that it was and she went back to her knitting. We went on inside and the man ushered me into his study. Since we were both keeping the masquerade I went in first, as befitted a visitor being escorted. I did not like turning my back on him.

For that reason I was half expecting it. He hit me near the base of the neck. But I rolled with it and went down almost unhurt. I continued to roll and fetched up on my back.

In training school they used to slap us with sandbags for trying to get up, once down. I recall my *savate* instructor saying in a flat Belgian accent, "Brave men get up again—and die. Be a coward—fight from the floor."

So I was on my back and threatening him with my heels as soon as I hit. He danced back out of range. Apparently he did not have a gun and I could get at mine. But there was an open fireplace in the room, a real one, complete with poker, shovel, and tongs. He circled toward it.

There was a small table just out of my reach. I half rolled, half lunged, grabbed a leg and threw it. It caught him in the face as he was grabbing the poker. Then I was on him.

His master was dying in my fingers and he himself was convulsing under its last, terrible command when I became aware of nerve-shattering screams. His wife was standing in the doorway. I bounced up and let her have one, right about her double chin. She went down in mid scream and I returned to her husband.

A limp man is amazingly hard to lift; it took me longer to get him up and across my shoulders than it had to silence him. He was heavy. Fortunately I am a big husky, all hands and feet; I managed a lumbering dog trot toward the car. I doubt if the noise of our fight disturbed anyone but my victim's wife, but her screams must have aroused half that end of town. There were people popping out of doors on both sides of the street. So far, none of them was near, but I was glad to see that I had left the car door open. I hurried toward it.

Then I was sorry; a brat who looked like the twin of the one who had given me trouble earlier was inside fiddling with the controls. Cursing, I dumped my prisoner in the lounge circle and grabbed at the kid. The boy shrank back and struggled, but I tore him loose and threw him out—straight into the arms of the first of my pursuers.

That saved me. He was still untangling himself as I slammed into the driver's seat and shot forward without bothering with door or safety belt. As I took the first corner the door swung shut and I almost went out of my seat; I then held a straight course long enough to fasten the belt. I cut sharp on another corner, nearly ran down a ground car coming out, and went on.

I found the wide boulevard I needed—the Paseo, I think—and jabbed the takeoff key. Possibly I caused several wrecks; I had no time to worry about it. Without waiting to reach altitude I wrestled her to course east and continued to climb as I made easting. I kept her on manual across Missouri and expended every launching unit in her racks to give her more speed. That reckless and illegal action may have saved my neck; somewhere over Columbia, just as I fired the last one, I felt the car shake to concussion. Someone had launched an interceptor, a devil-chaser would be my guess—and the pesky thing had fused where I had just been.

There were no more shots, which was good, as I would have been a duck on water from then on. My starboard impeller began to run hot immediately thereafter, possibly from the near miss or perhaps simply from abuse. I let it heat, praying that it would not fly apart, for another ten minutes. Then, with the Mississippi behind me and the indicator way up into "danger" I cut it out and let the car limp along on the port unit. Three hundred was the best she would do—but I was out of Zone Red and back among free men.

Up until then I had not had time to give my passenger more than a glance. He lay where I had slung him, sprawled on the floor pads, unconscious or dead. Now that I was back among men and no longer had the power for illegal speeds there was no reason not to go automatic. I flipped on the transponder, signaled a request for block assignment, and put the controls on automatic without waiting for permission. A block control technician might curse me out and even note my signal for a citation, but they would fit me into the system somehow. I swung around into the lounge and looked my man over.

He was breathing but still out. There was a welt on his face where I had clipped him with the table, but no bones seemed broken and I doubted that he would be unconscious from that cause. I slapped his face and dug my thumbnails into his ear lobes but I could not rouse him.

The dead slug was beginning to stink but I had no way to dispose of it. I let him be and went back to the control seat.

The chronometer read twenty-one thirty-seven Washington time—and I still had better than six hundred miles to go. At my best speed on one power plant, allowing nothing for landing, for tearing over to the White House and finding the Old Man, I would reach Washington a few minutes after midnight. So I had already failed to carry out the letter of my orders and the Old Man was sure as the devil going to make me stay in after school for it.

I took a chance and tried to start the starboard impeller. No dice—it was probably frozen solid and needing a major overhaul. Perhaps just as well, as anything that goes that fast can be explosively dangerous if it gets out of balance—so I desisted and tried to raise the Old Man by phone.

The phone would not work. Perhaps I had jiggered it in one of the spots of exercise I had been forced to take that day but I had never had one fail me before. Printed circuits, transistors, and the whole works being embedded in plastic made those units almost as shock resistant as a proximity fuse. I put it back in my pocket, feeling that this was one of those days when it was just not worthwhile to get out of bed. I turned to the car's communicator and punched the emergency tab.

"Control," I called out. "Control! This is an emergency!"

The screen lighted up and I was looking at a young man. He was, I saw with relief, bare-skinned so far as he appeared in the screen. "Control answering—Block Fox Eleven. What are you doing in the air? I've been trying to raise you ever since you entered my block."

"Never mind!" I snapped. "Patch me into the nearest military circuit. This is crash priority!"

He looked uncertain, but the screen flickered and went blank. Shortly another picture built up showing a military message center—and that did my heart good, as every person in sight was stripped to the waist. The foreground was occupied by a young watch officer; I could have kissed him. Instead I said, "Military emergency—patch me through to the Pentagon and there to the White House."

"Who are you?"

"No time, no time! I'm a civil agent and you wouldn't recognize my I.D. if you saw it. Hurry!"

I might have talked him into it but he was shouldered out of scan by an older man, a wing commander by his cap insignia. "Land at once!" was all that he said.

"Look, skipper," I said. "This is a military emergency; you've got to put me through. I—"

"*This* is a military emergency," he interrupted, "and all civil craft have been grounded for the past three hours. Land at once."

"But I've got to—"

"Land or be shot down. We are tracking you; I am about to launch an interceptor to burst a half mile ahead of you. Hold your course, or make any maneuver but landing, and the next one will burst on."

"Will you *listen*, please? I'll land, but I've got to get—" He switched off, leaving me with my jaw pumping air.

The first burst seemed considerably short of a half mile ahead of me; I landed.

I cracked up in doing it, but without hurting myself or my passenger. I did not have long to wait. They had me flare-lighted and were swooping down on me before I had satisfied myself that the boat wouldn't move. They took me in and I met the wing commander personally. He even put my message through after his psych squad got through giving me the antidote for the sleep test. By then it was one-thirteen, zone five—and Schedule Counter Blast had been underway for exactly that hour and thirteen minutes.

The Old Man listened to a summary, grunted, then told me to shut up and see him in the morning.

XIX

If the Old Man and I had gone to the National Zoological Gardens instead of sitting around in the park, it would not have been necessary for me to go to Kansas City. The ten titans we had captured at the joint session of Congress, plus two the next day, had been entrusted to the director of the zoo to be placed on the shoulders of unlucky anthropoids—chimps and orangutans, mostly. No gorillas.

The director had had the apes locked up in the zoo's veterinary hospital. Two chimpanzees, Abelard and Heloise, were caged together; they had always been mates and there seemed to be no reason to separate them. Maybe that sums up our psychological difficulty in dealing with the titans; even the men who transplanted the slugs to the apes still thought of the result as apes, rather than as titans.

The treatment cage next to that of the two chimps was occupied by a family of tuberculous gibbons. They were not used as hosts, since they were sick, and there was no communication between cages. They were shut one from another by sliding, gasketed panels and each cage had its own airconditioning. I've been in worse hospitals; I remember one in the Ukraine—

Anyhow, the next morning the panel had been slid back and the gibbons and the chimps were all in together. Abelard, or possibly Heloise, had found some way to pick the lock. The lock was supposed to be monkey proof, but it was not ape-*cum*-titan proof. Don't blame the designer of the lock.

Two chimps plus two titans plus five gibbons—the next morning there were seven apes ridden by *seven* titans.

This was discovered two hours before I left for Kansas City, but the Old Man had not been notified. Had he been, he would have *known* that Kansas City was saturated. I might have figured it out for myself. Had the Old Man known about the gibbons, Schedule Counter Blast would not have taken place.

Schedule Counter Blast was the worst wet firecracker in military history. The evolution was beautifully worked out and the drops were made simultaneously just at midnight, zone five, on over ninety-six hundred communication points—newspaper offices, block controls, relay stations, and so forth. The raiding squad were the cream of our sky-borne forces, mostly veteran noncoms, and with them, technicians to put each communication point back into service.

Whereupon the President's speech and the visual display would go out from each local station; Schedule Bare Back would take effect all through the infected territory; and the war would be over, save for minor mopping up.

Ever see a bird hurt itself by flying into a glass window? The bird is not stupid; he simply did not have all the data.

By twenty-five minutes after midnight reports started coming in that such-and-such points were secured. A little later there were calls for help from other points. By one in the morning most of the reserves had been committed but the operation was clearly going well—so well, indeed, that unit commanders were landing and were reporting from the ground.

That was the last anybody ever heard of them.

Zone Red swallowed up the task force as if it had never existed—over eleven thousand military craft, more than a hundred and sixty thousand fighting men and technicians, seventy-one group commanders and—why go on? The United States had received its worst military setback since Black Sunday. Not in numbers, for there was not a city bombed, but in selected quality.

Let me make it clear that I am not criticizing Martinez, Rexton, the General Staff, or those poor devils who made the drop. The program was properly planned, it was based on what appeared to be a true picture, and the situation called for fast action with the best we had. If Rexton had sent any but his best boys he would have earned a court martial; the Republic was at stake and he had the sense to realize it.

But he did not know about the seven apes.

It was nearly daylight, so I understand, before Martinez and Rexton got it through their heads that the messages they had gotten back about successes were actually faked, fakes sent by their own men—*our* own men—but hag-ridden, possessed, and brought into the masquerade. After my report, more than an hour too late to stop the raids, the Old Man had tried to get them not to send in any more men, but they were flushed with success and anxious to make a clean sweep.

The Old Man asked the President to insist on visual checks of what was happening, but the operation was being controlled by relay through Space Station Alpha and there just aren't enough channels to parallel audio with video through a space station. Rexton had said, "They know what they are up against; quit worrying. As fast as we get local stations back in our hands, our boys will patch back into the ground relay net and you will have all the visual evidence you want."

The Old Man had pointed out that by then it would be too late.

Rexton had burst out, "Confound it, man!—I can't stop soldiers in action to have them take pictures of bare backs. Do you want a thousand men to let themselves be killed just to quiet your jitters?"

The President had backed him up.

By early morning they had their visual evidence. Stereo stations in the Central Valley were giving out with the same old pap; *Rise and Shine with Mary Sunshine, Breakfast with the Browns*, and such junk. There was not a station with the President's stereocast, not one that even conceded that anything had happened. The military dispatches tapered off and stopped around four o'clock and Rexton's frantic calls were not answered. Task Force Redemption of Schedule Counter Blast ceased to exist—*spurlos versenkt.*

I got this not from the Old Man but from Mary. Being the President's little shadow who went in and out with him, she had a box seat. I did not get to see the Old Man until nearly eleven the next morning. He let me report without comment, and without bawling me out, which was worse.

He was about to dismiss me when I put in, "How about my prisoner? Didn't he confirm my conclusions?"

"Oh, him? Still unconscious, by the last report. They don't expect him to live. The psychotechnicians can't get anything out of him."

"I'd like to see him."

"You stick to things you understand."

"Well—have you got something for me to do?"

"Not at the moment. I think you had better—No, do this: trot down to the National Zoo. You'll see some things that may put a different light on what you picked up in Kansas City."

"Huh?"

"Look up Doctor Horace, he's the Assistant Director. Tell him I sent you."

So I went down to see the animals. I tried to find Mary, but she was tied up.

Horace was a nice little guy who looked like one of his own baboons; he turned me over to a Doctor Vargas who was a specialist in exotic biologies—the same Vargas who was on the Second Venus Expedition. He told me what had happened and I looked at the gibbons, meantime rearranging my prejudices.

"I saw the President's broadcast," he said conversationally, "weren't you the man who—I mean, weren't you the—"

"Yes, I was 'the man who'," I agreed shortly.

"Then you can tell us a great deal about these phenomena. Your opportunities have been unique."

"Perhaps I should be able to," I admitted slowly, "but I can't."

"Do you mean that no cases of fission reproduction took place while you were, uh, their prisoner?"

"That's right." I thought about it and went on, "At least, I think that's right."

"Don't you know? I was given to understand that, uh, victims have full memory of their experiences?"

"Well, they do and they don't." I tried to explain the odd detached frame of mind of a servant of the masters.

"I suppose it could happen while you sleep."

"Maybe. Besides sleep, there is another time, or rather times, which are difficult to remember. During conference."

"Conference?"

So I explained. His eyes lit up, "Oh, you mean 'conjugation'."

"No, I mean 'conference'."

"We mean the same thing. Don't you see? Conjugation and fission—they reproduce at will, whenever the food supply, that is to say the supply of hosts, permits. Probably one contact for each fission; then, when the opportunity exists, fission—two fully adult daughter parasites in a matter of hours . . . or less, possibly."

I thought it over. If that were true—and looking at the gibbons, I could not doubt it—then why had we depended on shipments at the Constitution Club? Or had we? In fact I did not know; I did what my master wanted done and saw only what came under my eyes. But why had we not saturated New Brooklyn as Kansas City had been saturated. Lack of time?

It was clear how Kansas City had been saturated. With plenty of "livestock" at hand and a space ship loaded with transit cells to draw from, the titans had reproduced to match the human population.

I am no biologist, exotic or otherwise, but I can do simple arithmetic. Assume a thousand slugs in that space ship, the one we believed to have landed near Kansas City; suppose that they could reproduce when given the opportunity every twenty-four hours.

First day, one thousand slugs.

Second day, two thousand.

Third day, four thousand.

At the end of the first week, the eighth day, that is—*a hundred and twentyeight thousand* slugs.

After two weeks, *more than sixteen million slugs*.

But we did not know that they were limited to spawning once a day; on the contrary the gibbons proved they weren't. Nor did we know that a flying saucer could lift only a thousand transit cells; it might be ten thousand—or more—or less. Assume ten thousand as breeding stock with fission every twelve hours. In two weeks the answer comes out—

MORE THAN TWO AND A HALF TRILLION!!!!

The figure did not mean anything; it was cosmic. There aren't anything like that many people on the whole globe, not even if you counted in apes.

We were going to be knee deep in slugs—and that before long. I felt worse than I had in Kansas City.

Dr. Vargas introduced me to a Doctor McIlvaine of the Smithsonian Institution; McIlvaine was a comparative psychologist, the author, so Vargas told me, of *Mars, Venus, and Earth: A Study in Motivating Purposes*. Vargas seemed to expect me to be impressed but I was not as I had not read it. Anyhow, how can anyone study the motives of Martians when they were all dead before we swung down out of trees?

They started swapping trade talk not intelligible to an outsider; I continued to watch the gibbons. Presently McIlvaine asked me, "Mr. Nivens, how long does a conference last?"

"Conjugation," Vargas corrected him.

"Conference," McIlvaine repeated. "Keep your mind on the more important aspect."

"But, Doctor," Vargas insisted, "there are parallels in terrestrial biology. In primitive reproduction, conjugation is the means of gene exchange whereby mutation is spread through the body of the—"

"You are being anthropocentric. Doctor. You do not know that this life form has genes."

Vargas turned red. "I presume you will allow me gene equivalents?" he said stiffly.

"Why should I? I repeat, sir, that you are reasoning by analogy where there is no reason to judge that analogy exists. There is one and only one characteristic common to all life forms and that is the drive to survive."

"And to reproduce," insisted Vargas.

"Suppose the organism is immortal and has no need to reproduce?"

"But—" Vargas shrugged. "Your question is not germane; we know that they reproduce." He gestured at the apes.

"And I am suggesting," McIlvaine came back, "that this is not reproduction, but a single organism availing itself of more space, as a man might add a wing to his house. No, really. Doctor, I do not wish to be offensive, but it is possible to get so immersed in the idea of the zygote-gamete cycle that one forgets that there may be other patterns."

Vargas started out, "But throughout the entire system—"

McIlvaine cut him short. "Anthropocentric, terrocentric, solocentric—it is still a provincial approach. These creatures may be from outside the solar system entirely."

I said, "Oh, no!" I had had a sudden flash picture of the planet Titan and with it a choking sensation.

Neither one paid any attention to me. McIlvaine continued, "If you must have analogy, take the amoeba—an earlier, more basic, and much more successful life form than ours. The motivational psychology of the amoeba—"

I switched off my ears; I suppose free speech gives a man the right to talk about the 'psychology' of an amoeba, but I don't have to listen. They never did get back to asking me how long a conference takes, not that I could have told them. A conference is, well—*timeless*.

They did do some direct experimentation which raised my opinion of them a little. Vargas ordered brought in a baboon who was wearing a slug and had him introduced into the cage with the gibbons and the chimps. Up to then the gibbons had been acting like gibbons, grooming each other and such, except that they seemed rather quiet—and kept a sharp eye on our movements. As soon as the newcomer was dumped in they gathered in a ring facing outwards and went into direct conference, slug to slug. McIlvaine jabbed his finger excitedly at them. "You see? You see? Conference is *not* for reproduction, but for exchange of memory. The organism, temporarily divided, has now re-identified itself."

I could have told him the same thing without the double talk; a master who has been out of touch always gets into direct conference as soon as possible.

"Hypothesis!" Vargas snorted. "Pure hypothesis—they have no opportunity to reproduce just now. George!" He ordered the boss of the handling crew to bring in another ape.

"Little Abe?" asked the crew boss.

"No, I want one which is not supporting a parasite. Let me see—make it Old Red."

The crew boss glanced at the gibbons, looked away at once, and said, "Gripes, Doc, I'd rather you didn't pick on Old Red."

"This won't hurt him."

"Why can't I bring in Satan? He's a mean bastard anyway."

"All right, all right! But hurry it up; you are keeping Dr. McIlvaine waiting."

So they brought in Satan, a coal black chimp. He may have been aggressive elsewhere; he was not so here. They dumped him inside, he took one look around, shrank back against the door, and began to whine. It was like watching an execution; I could not stand to look but I couldn't look away. I had had my nerves under control—a man can get used to anything; there are people who make their livings by pumping out cesspools—but the ape's hysteria was contagious. I wanted to run.

At first the hag-ridden apes did nothing; they simply stared at him like a jury. It went on that way for a long while. Satan's whines changed to low, sobbing moans and he covered his face with his hands. Presently Vargas said, "Doctor! Look!"

"Where?"

"Lucy—the old female. There." He pointed.

It was the matriarch of the family of consumptive gibbons. Her back was toward us; I could see that the slug thereon had humped itself together. An iridescent line ran down the center of it.

It began to split as an egg splits. In a few minutes only, the division was complete. One new slug centered itself over her spine; the other flowed down her back. She was squatting, buttocks almost to the floor; it slithered off and plopped gently on the concrete.

It crept slowly toward Satan. The ape must have peeked through his fingers, for he screamed hoarsely—and swarmed up into the top of the cage.

So help me, they sent a squad to arrest him. Four of the biggest—two gibbons, a chimp, and a baboon. They tore him loose and hauled him down and held him face down on the floor.

The slug slithered closer.

It was a good two feet away when it grew a pseudopod—slowly, at first—a slimy stalk that weaved around like a cobra. Then it lashed out and struck the ape on the foot. The others promptly let go of him but Satan did not move.

The titan seemed to pull itself in by the extension it had formed and attached itself to Satan's foot. From there it crawled up; when it reached the base of his spine the ape stirred. Before it was settled at the top of his back Satan sat up. He shook himself and joined the others, stopping only to look us over.

Vargas and McIlvaine started talking excitedly, apparently quite unmoved otherwise. I wanted to smash something—for me, for Satan, for the whole simian race.

Vargas was insisting that nothing had been proved, while McIlvaine maintained that we were seeing something new to our concepts; an intelligent creature which was, by the fashion in which it was organized, immortal and continuous in its personal identity—or its group identity; the argument grew confused. In any case McIlvaine was theorizing that such a creature would have continuous memory of all its experiences, not just from the moment of fission, but back to its racial beginning. He described the slug as a four dimensional worm in spacetime, intertwined with itself as a single organism, and the talk grew so esoteric as to be silly.

As for me, I did not know and did not care. All very interesting, no doubt, but the only way I cared about slugs was to kill them. I wanted to kill them, early and often and as many as possible.

About that uninterrupted "racial memory" idea: wouldn't it be rather cumbersome to be able to recall exactly what you did the second Wednesday in March a million years ago?

XX

For a wonder, when I got back the Old Man was available and wanted to talk. The President had left to address a secret session of the United Nations and the Old Man had not been included in the party. I wondered if he had fallen out of official favor, but I did not say so.

He had me report fully on what I had seen at the zoo and questioned me closely; he had not been down there himself. I added my opinion of Vargas and McIlvaine. "A couple of boy scouts," I complained, "comparing stamp collections. They don't realize it's serious."

The Old Man took time out before answering. "Don't sell those boys short, son," he advised me. "They are more likely to come up with the answer than are you and I."

"Humph!" I said, or something stronger. "They are more likely to let those slugs escape. Remember Graves?"

"I do remember Graves. You don't understand scientific detachment."

"I hope I never do!"

"You won't. But it's the ignition system of the world; without it, we're sunk. Matter of fact, they did let one escape."

"Huh?"

"Didn't they tell you about the elephant?"

"What elephant? They damn near didn't tell me anything; they got interested in each other and ignored me."

"Sure that's not what's biting you? About the elephant: an ape with a rider got out, somehow. Its body was found trampled to death in the elephant house. And one of the elephants was gone."

"You mean there is an elephant loose *with a slug on him*?" I had a horrid vision of what that could mean—something like a tank with a cybernetic brain.

"Her," the Old Man corrected me, "it was a cow elephant. I didn't say so, anyhow. They found her over in Maryland, quietly pulling up cabbages. No parasite."

"Where did the slug get to?" Involuntarily I glanced around. The Old Man chuckled.

"Don't worry; I don't have it in here. But a duo was stolen in the adjoining village. I'd say the slug is somewhere west of the Mississippi by now."

"Anybody missing?"

He shrugged again. "How can you tell, in a free country? At least, the titan can't hide on a human host anywhere short of Zone Red."

That seemed true; Schedule Bare Back appeared to be operating one hundred percent. That made me think of something else, something I had seen at the zoo and had not reasoned through. Whatever it was, it eluded me. The Old Man went on, "It's taken drastic action to make the bare-shoulders order stick, though. The President has had a flood of protests on moral grounds, not to mention the National Association of Men's Haberdashers."

"Huh?"

"You would think we were trying to sell their daughters down to Rio, the way some of them carry on. There was a delegation in, called themselves The Mothers of the Republic, or some such nonsense."

"The President's time is being wasted like *that*, at a time like *this*?"

"McDonough handled them. But he roped me in on it, damn his eyes." The Old Man looked pained. "We told them that they could not see the President unless they stripped absolutely naked. That stopped 'em."

The thought that had been bothering me came to the surface. "Say, boss, you might have to."

"'Have to what?"

"Make people strip naked."

He chewed his lip and looked worried. "What are you driving at?"

"Do we know, as a certainty, that a slug can attach itself to its host only near the base of the brain?"

"You should know, better than I do."

"I thought I did, but now I'm not sure. That's the way we always did it, when I was, uh, with them." I recounted again, in more detail, what I had seen when Vargas had had poor old Satan exposed to a slug. "That ape moved as soon as the thing reached the base of his spine, clear down at his tail bone. Maybe they prefer to ride up near the brain—I'm sure they do. But maybe they don't have to. Maybe they could ride down inside a man's pants and just put out an extension to the end of his spinal cord."

"Hmm . . . you'll remember, son, that the first time I had a crowd searched for one I made everybody peel clear down to the buff. That was not accidental; I wanted to be sure."

"I think you were justified. See here; they might be able to conceal themselves anywhere on the body, if they have to. Inside a pair of shorts, for example. Of course you couldn't hide anything under some shorts—" I was thinking of the skintight things that Mary wore. "—but take those droopy drawers you've got on. One could hide in them and it would just make you look a bit satchel fannied—a bit more, I should say."

"Want me to take 'em off?"

"I can do better than that; I'll give you the Kansas City Clutch." My words were joking but I was not; I grabbed at the bunchiness of his pants and made sure he was clean. If he had not been, he would have contorted and gone unconscious had I clutched a parasite. He submitted to it with good grace, then gave me the same treatment.

"But we can't," he complained as he sat down, "go around slapping women on the rump. It won't do."

"You may have to," I pointed out, "or make everybody strip."

"We'll run some experiments."

"How?" I asked.

"You know that head-and-spine armor deal? It's not worth much, except to give a feeling of security to anybody who bothers to wear one. I'll tell Doctor Horace to take an ape, fit an armor to him so that a slug can't reach anything but his legs, say—and see what happens. Or use some other method to limit the area of attack, and vary the areas, too. We'll find out."

"Uh, yes. But don't have him use an ape, boss."

"Why not?"

"Well—they're too human."

"Damn it, bub, you can't make an omelet—"

"—without breaking eggs. Okay, okay, but I don't have to like it. Anyhow, we'll find out."

I could see that he did not like what he was thinking. "I hope it turns out that you are wrong. Yes, sir, I surely do. It has been hard enough to get their shirts off; I'd hate like the very deuce to try to get 'em to take off their drawers as well." He looked worried.

"Well, maybe it won't be necessary."

"I hope not."

"By the way, we're moving back to the old nest."

"How about the New Philadelphia hideout?" I asked.

"We'll keep both. This war may go on a long time."

"Speaking of such, what have you got for me now?"

"Well, now, as I said, this is likely to prove a long war. Why don't you take some leave? Indefinite—I'll call you back when I need you."

"You always have," I pointed out. "Is Mary going on leave?"

"What's that got to do with it?"

"I asked you a straight question. Boss."

"Mary is on duty, with the President."

"Why? She's done her job, and nobly. You aren't depending on her being able to smell out a slug, not if I know you. You don't need her as a guard; she's too good an agent to waste on such work."

"See here—when did you get so big that you are telling me how to use other agents? Answer that and make it good."

"Oh, skip it, skip it," I told him, my temper very much out of hand. "Let it lay that if Mary isn't taking leave, I don't want leave—and none of your business why."

"That's a nice girl."

"Did I say she wasn't? Keep your nose out of my affairs. In the meantime, give me a job to do."

"I say you need to take leave."

"So you can make damn sure that I don't have any free time when Mary has? What is this? A YWCA?

"I say you need leave because you are worn out."

"Hunh!"

"You are a fair-to-good agent when you are in shape. Right now you aren't; you've been through too much. No, shut up and listen: I send you out on a simple assignment. Penetrate an occupied city, look it over and see everything there is to see and report back by a certain time. What do you do? You are so jittery that you hang around in the suburbs and are afraid to go downtown. You don't keep your eyes open and you damn near get caught three times. Then when you do head back, you get so nervy that you burn out your ship and fail to get back in time to be of any use. Your nerve is shot and your judgment with it. Take leave—sick leave, in fact."

I stood there with my ears burning. He did not directly blame me for the failure of Schedule Counter Blast but he might as well have. I felt that it was unfair—and yet I knew that there was truth in it. My nerves used to be like rock, and now my hands trembled when I tried to strike a cigarette.

Nevertheless he let me have an assignment—the first and only time I have ever won an argument with him.

A hell of an assignment—I spent the next several days lecturing to brass, answering fool questions about what titans eat for lunch, explaining how to tackle a man who was possessed. I was billed as an "expert" but half the time my pupils seemed sure that they knew more about slugs than I did.

Why do people cherish their preconceptions? Riddle me that.

XXI

Operation Parasite seemed to come to a dead stop during this period. The titans continued to hold Zone Red, but they could not break out without being spotted. And we did not try to break in for the good reason that every slug held one of our own people as hostage. It was a situation which might go on for a long time.

The United Nations were no help. The President wanted a simple act of cooperation—Schedule Bare Back on a global scale. They hemmed and hawed and sent the matter to committee for investigation. The plain truth was they did not believe us; that was always the enemy's great advantage—only the burned believed in the fire.

Some nations were safe from the slugs through their own customs. A Finn who did not strip down and climb into a steam bath, in company, every day or so would have been conspicuous. The Japanese, too, were casual about undressing. The South Seas were relatively safe, as were large parts of Africa. France had gone enthusiastically nudist, on weekends at least, right after World War III—a slug would have a tough time hiding in France.

But in countries where the body-modesty taboo meant something a slug could stay hidden until his host began to stink. The United States itself, Canada—England, most particularly England. "Aren't you getting excited over nothing, old chap? Take off my weskit? Now, really!"

They flew three slugs (with apes) to London; I understand that the King wanted to set an example as the President had, but the Prime Minister, egged on by the Archbishop of Canterbury, would not let him. The Archbishop had not even bothered to look; moral behavior was more important than mundane peril. Nothing about this appeared in the news and the story may not be true, but English skin was not exposed to the cold stares of neighbors.

The Cominform propaganda system began to blast us as soon as they had worked out a new line. The whole thing was an "American Imperialist fantasy" intended to "enslave the workers"; the "mad dogs of capitalism" were at it again.

I wondered why the titans had not attacked Russia first; Stalinism seemed tailormade for them. On second thought, I wondered if they had. On third thought I wondered what difference it would make; the people behind the Curtain had had their minds enslaved and parasites riding them for three generations. There might not be two kopeks difference between a commissar with a slug and a commissar without a slug.

There would be one change: their intermittent purges would take a different form; a "deviationist" would be "liquidated" by plastering a titan on his neck. It wouldn't be necessary to send him to the gas chamber.

Except when the Old Man picked me to work with him I was not close to the center of things; I saw the war with the titans as a man sees hurricanes—his small piece only. I did not see the Old Man soon and I got my assignments from Oldfield, his deputy. Consequently I did not know of it when Mary was relieved from special duty with the President. I ran into her in the lounge of the Section offices. "Mary!" I yelped and fell over my feet getting to her.

She gave me that long, slow, sweet smile and moved over to make room for me. "Hello, darling!" she whispered. She did not ask me what I had been doing, nor scold me that I had not been in touch with her, nor even comment on how long it had been. Mary always let the water over the dam take care of itself.

Not me—I babbled. "This is wonderful! I thought you were still tucking the President into his beddy-bye. How long have you been here? Do you have to go back right away? Say, can I dial you a drink—no, you've got one." I started to dial for an old-fashioned and discovered that Mary had already done so; it popped out almost into my hand. "Huh? How'd this get here?"

"I ordered it when you came in the door."

"You did? Mary, did I tell you that you are wonderful?"

"No."

"Very well, then, I will: You're wonderful."

"Thank you."

I went on, "This calls for a celebration! How long are you free? Say, couldn't you possibly get some leave? They can't expect you to be on duty twenty-four hours a day, week after week, with no time off. I think I'll go right straight to the Old Man and tell him just what—"

"I'm on leave, Sam."

"—just what I think of that sort of—Huh?"

"I'm on leave now."

"You *are*? For how long?"

"Subject to call. All leaves read that way now."

"But—How long have you been on leave?"

"Since yesterday. I've been sitting here, waiting for you to show up."

"Yesterday!" And I had spent yesterday giving more kindergarten lectures to brass hats who did not want them. "Oh, for the love of—" I stood up. "Stay right where you are. Don't move. I'll be right back."

I rushed over to the operations office. I got in to see the chief deputy by insisting that I had a very urgent matter that he had to attend to. Oldfield looked up when I came in and said in a surly tone, "What do *you* want?"

"Look, chief, that series of bedtime stories I'm scheduled to tell: better cancel them."

"Why?"

"I'm a sick man; I've been due for sick leave for a long time. Now I've just got to take it."

"You're sick in the head, if you ask me."

"That's right; I'm sick in the head. Sometimes I hear voices. People have been following me around. I keep dreaming I'm back with the titans." That last point was regrettably true.

"But since when has this being crazy been any handicap in this section?" He leaned back and waited for me to argue the point.

"Look—do I get leave or don't I?"

He fumbled through papers on his desk, found one and tore it up. "Okay. Keep your phone handy; you're subject to recall. Get out."

I got. Mary looked up when I came in and gave me the soft warm treatment again. I said, "Grab your things; we're leaving."

She did not ask where; she simply stood up. I snatched my drink, gulped half of it and spilled the rest. We went up and were out on the pedestrian level of the city before either one of us said anything. Then I asked, "Now—where do you want to get married?"

"Sam, we discussed that before."

"Sure we did and now we are going to do it. Where?"

"Sam, Sam my very dear—I will do what you say. But I am bound to tell you that I am still opposed to it."

"Why?"

"Sam, let's go straight to my apartment. I'd like to cook dinner for you."

"Okay, you can cook dinner—but not in your apartment. And we get married first."

"Please, Sam!"

I heard somebody say, "Keep pitching, kid. She's weakening." I looked around and found that we were playing to a good-sized gallery.

I swept an arm wide, almost clipping the youngster who had given me the advice and shouted irritably, "Haven't you people got anything else to do? Go get drunk!"

Somebody else said, "I'd say he ought to take her offer; he won't get a better one."

I grabbed Mary by the arm and hurried her away from there. I did not say another word until I had gotten her into a cab and closed off the driver's compartment from the lounge. "All right," I said gruffly, "why not get married? Let's have your reasons."

"Why get married, Sam? I'm yours; you don't need a contract."

"Why? Because I love you; that's one reason, damn it!"

She did not answer for quite a while; I thought I had offended her.

When she did I could hardly hear her. "You hadn't mentioned that before, Sam."

"Hadn't I? Oh, I must have. I'm sure I have."

"No, I'm sure, quite sure, that you haven't. Why didn't you?"

"Unh, I don't know. Just an oversight, I guess. I'm not right sure what the word 'love' means."

"Neither am I," she said softly, "but I love to hear you say it. Say it again, please."

"Huh? Okay. I love you. I love you, Mary."

"Oh, Sam!"

She snuggled in against my shoulder and began to tremble. I shook her a little. "How about *you*?"

"Me? Oh, I love you, Sam. I do love you. I've loved you ever since—"

"Ever since when?"

I thought she was going to say that she had loved me ever since I took her place in Project Interview; what she said was, "I've loved you ever since you slapped me."

Is that logic?

The driver was cruising slowly east along the Connecticut coast; I had told him just to drive around. I had to wake him up before I could get him to land us in Westport. We went straight to the City Hall.

I stepped up to a counter in the Bureau of Sanctions and Licenses and said to a clerk there, "Is this where we get married?"

"That's up to you," he answered. "Hunting licenses on the left, dog licenses on the right, this desk is the happy medium—I hope." He leered at me.

I don't like smart boys and the gag was ancient. "Very well," I said stiffly, "will you oblige by issuing us a license?"

"Sure thing. Everybody ought to get married at least once; that's what I keep telling my old lady." He got out a large printed form. "Let's have your serial numbers."

We gave them to him. He slid the form into a typer and recorded them. "Now—are either of you married in any other state?" We said that we weren't; he went on, "You're sure, now? If you are and don't tell me, so I can put a rider on this showing the other contracts, this contract ain't valid."

We told him again that we weren't married anywhere. He shrugged and went on, "Term, renewable, or lifetime? If it's over ten years, the fee is the same as for lifetime; if it's under six months, you don't need this; you get the short form from that vendo machine over there by the wall."

I looked at Mary; she said in a very small voice, "Lifetime."

The clerk looked surprised. "Lady, are you sure you know what you're doing? The renewable contract, with the automatic option clause, is just as permanent and you don't have to go through the courts if you change your mind."

I said, "You heard the lady! Put it down."

"Okay, okay—either party, mutual consent, or binding?"

"Binding," I answered and Mary nodded.

"Binding it is," he agreed, stroking the typer. "Now we come to the meat of the matter: who pays and how much? And is it salary or endowment?"

I said, "Salary"; I didn't own enough to set up a fund.

At the same time and in a firm voice Mary said, "Neither."

The clerk said, "Huh?"

"Neither one," Mary repeated. "This is not a financial contract."

The clerk stopped completely, looked at me, and then looked at Mary. "Now, look, lady," he said reasonably, "don't be foolish. You heard the gentleman say that he was willing to do the right thing."

"No."

"Hadn't you better talk it over with your lawyer before you go ahead with this? There's a public communicator out in the hall."

"No!"

"Well—I'm darned if I see what you need a license for."

"Neither do I," Mary told him.

"You mean you don't want this?"

"*No*! Put it down the way I told you to. 'No salary'."

The clerk looked helpless but bent over the typer again. "I guess that's all we need," he said finally. "You've kept it simple, I'll say that for you. 'Do-you both-solemnly-swear-that-the-above-facts-are-true-to-the-best-of-your-knowledge-and-belief-that-you-aren'tentering-into-this-agreement-uninfluenced-by-drugs-orother-illegal-inducements-and-that-there-exists-no-other-covenants-nor-other-legal-impediments-to-the-execution-and-registration-of-the-above-contract?' "

We both said that we did and we were and it was and there weren't. He pulled the form out of the typer. "Let's have your thumb prints . . . okay; that'll be ten dollars, including the federal tax." I paid him and he shoved the form into the copier and threw the switch. "Copies will be mailed to each of you," he announced, "at your serial-number addresses. Now—what type of ceremony are you looking for? Maybe I can be of help."

"We don't want a religious ceremony," Mary told him and I agreed.

He nodded. "Then I've got just what you're looking for. Old Doctor Chamleigh. He's completely nonsectarian, best stereo accompaniment in town, all four walls and full orchestra. He gives you the whole works, fertility rites and everything, but dignified. And he tops it off with a fatherly straight-from-the-shoulder word of advice. Makes you feel *married*."

"No." This time I said it.

"Oh, come, now!" the clerk said to me. "Think of the little lady. If she sticks by what she just swore to—and I'm not saying she won't—she'll never have another chance. Every girl is entitled to a formal wedding. Honest—I don't get much of a commission out of it."

I said, "See here, you can marry us, can't you? Go ahead. Get it over with!"

He looked surprised and said, "Didn't you know? In this state you marry yourself. You've *been* married, ever since you thumbprinted the license."

I said, "Oh—" Mary didn't say anything. We left.

I hired a duo at the landing flat north of town; the heap was ten years old and smelled of it but it had full-automatic and that was all that really mattered. I looped around the city, cut across Manhattan Crater, and set the controls. We didn't talk much; there didn't seem to be much to say just yet. I was happy but terribly nervous—and then Mary put her arms around me and after a bit I wasn't nervous any longer but happier than ever. After a long time that seemed short I heard the *BEEEEP*! *beep-beep BEEEEP*! of the beacon at my shack in the mountains, whereupon I unwound myself, took over manual, and landed. Mary said sleepily, "Where are we?"

"At my cabin in the mountains," I told her.

"I didn't know you had a cabin in the mountains. I thought you were headed for my apartment."

"What, and risk those bear traps? Anyhow, it's not mine; it's ours."

She kissed me again and I loused up the landing. She slid out ahead of me while I was securing the board, then I followed and found her staring at my shack. "Sweetheart, it's beautiful!"

"You can't beat the Adirondacks," I agreed. There was a slight haze with the sun low in the west, giving that wonderful, depth upon depth, stereo look that you never get anywhere else. "I picked this place for the view."

She glanced at it and said, "Yes, yes—but I didn't mean that. I meant your—*our* cabin. Let's go inside, right now."

"Suits," I agreed, "but it's really just a simple shack." Which it was—not even an indoor pool. I had kept it that way on purpose; when I came up here I didn't want to feel that I had brought the city with me. The shell was conventional steel-and-fiberglass construction but I had had it veneered in duroslabs which could not be told from real logs unless you took a knife to them. The inside was just as simple—a big living room with a real, wood-burning fireplace, deep plain-colored rugs, and plenty of low chairs. The services were all in a Kompacto special, the shell of which was buried under the foundation—airconditioner, power pack, cleansing system, sound equipment, plumbing, radiation alarm, servos—everything but the deep-freeze and the other kitchen equipment, out of sight and out of mind. Even the stereo screens were covered up and would not be noticed unless in use. It was about as near as a man could get to a real log cabin and still have inside plumbing.

"*I* think it's just lovely," Mary said seriously. "I wouldn't want to have an ostentatious place."

"You and me both." I worked the combo and the front door dilated; Mary was inside at once. "Hey! Come back here!" I yelled.

She did so. "What's the matter, Sam? Did I do something wrong?"

"You sure did." I dragged her back to me, then swung her up in my arms and carried her across the threshold. I kissed her as I put her down. "There. Now you are in your own house, properly."

The lights had come on as we entered the house. She looked around her, then turned and threw her arms around my neck. "Oh, darling, darling! I can't see—my eyes are all blurry."

Mine were blurry, too, so we took time out for mutual treatment. Then she started wandering around, touching things. "Sam, if I had planned it all myself, it would have been just this way."

"It hasn't but one bathroom," I apologized. "We'll have to rough it a bit."

"I don't mind. In fact I'm glad; now I know you didn't bring any of those women of yours up here."

"What women?"

"You know darn well what women. If you had been planning this as a nest, you would have included a woman's bathroom."

"You know too much."

She did not answer but wandered on out into the kitchen. I heard her squeal. "What's the matter?" I asked, following her out.

"I never expected to find a real kitchen in a bachelor's lodge."

"I'm not a bad cook myself. I wanted a kitchen so I bought one."

"I'm so glad. Now I *will* cook you dinner."

"It's your kitchen; suit yourself. But don't you want to wash up? You can have first crack at the shower if you want it. And tomorrow we'll get a catalog and you can pick out a bathroom of your own. We'll have it flown in."

"No hurry," she said. "You take the first shower. I want to start dinner."

So I did. I guess she did not have any trouble figuring out the controls and filing system in the kitchen, for about fifteen minutes later while I was whistling away in the shower, letting the hot water soak in, I heard a tap on the shower door. I looked through the translucent panel and saw Mary silhouetted there.

"May I come in?" she called out.

"Sure, sure!" I said, "Plenty of room." I opened the door and looked at her. She looked good. For a moment she stood there, letting me look but with a sweet shyness on her face that I had never seen before.

I put on an expression of utter surprise and said, "Honey! What's the matter? Are you sick?"

She looked startled out of her wits and said, "Me? What do you mean?"

"There's not a gun on you anywhere."

She giggled and came at me. "Idiot!" she squealed and started to tickle me. I got her left arm in a bonebreaker but she countered with one of the nastiest judo tricks that ever came out of Japan. Fortunately I knew the answer to it and then we were both on the bottom of the shower and she was yelling, "Let me up! You're getting my hair all wet."

"Does it matter?" I asked, not moving. I liked it there.

"I guess not," she answered softly and kissed me. So I let her up and we rubbed each other's bruises and giggled. It was quite the nicest shower I have ever had.

Mary and I slipped into domesticity as if we had been married for twenty years. Oh, not that our honeymoon was humdrum, far from it, nor that there weren't a thousand things we still had to learn about each other—the point was that we already seemed to know the necessary things about each other that made us married. Especially Mary.

I don't remember those days too clearly, yet I remember every second of them. I went around feeling gay and a bit confused. My Uncle Egbert used to achieve much the same effect with a jug of corn liquor, but we did not even take tempus pills, not then. I was happy; I had forgotten what it was like to be happy, had not known that I was not happy. Interested, I used to be—yes. Diverted, entertained, amused—but not happy.

We did not turn on a stereo, we did not read a book—except that Mary read aloud some Oz books that I had. Priceless items, they were, left to me by my greatgrandfather; she had never seen any. But that did not take us back into the world; it took us farther out.

The second day we did go down to the village; I wanted to show Mary off. Down there they think I am a writer and I encourage the notion, so I stopped to buy a couple of tubes and a condenser for my typer and a roll of copy tape, though I certainly had no intention of doing any writing, not this trip. I got to talking with the storekeeper about the slugs and Schedule Bare Back—sticking to my public *persona* of course. There had been a local false alarm and a native in the next town had been shot by a triggerhappy constable for absentmindedly showing up in public in a shirt. The storekeeper was indignant. I suggested that it was his own fault; these were war conditions.

He shook his head. "The way I see it we would have had no trouble at all if we had tended to our own business. The Lord never intended men to go out into space. We should junk the space stations and stay home; then we would be all right."

I pointed out that the slugs came here in their own ships; we did not go after them—and got a warning signal from Mary not to talk too much.

The storekeeper placed both hands on the counter and leaned toward me. "We had no trouble *before* space travel; you'll grant that?"

I conceded the point. "Well?" he said triumphantly.

I shut up. How can you argue?

We did not go into town after that and saw no one and spoke to no one. On the way home (we were on foot) we passed close to the shack of John the Goat, our local hermit. Some say that John used to keep goats; I know he smelled like one. He did what little caretaking I required and we respected each other, that is, we saw each other only when strictly necessary and then as briefly as possible. But, seeing him, I waved.

He waved back. He was dressed as usual, stocking cap, an old army blouse, shorts, and sandals. I thought of warning him that a man had been shot nearby for not complying with the bare-to-the-waist order, but decided against it. John was the perfect anarchist; advice would have made him only more stubborn. Instead I cupped my hands and shouted, "Send up the Pirate!" He waved again and we went on without coming within two hundred feet of him, which was about right unless he was downwind.

"Who's the Pirate, darling?" Mary asked.

"You'll see."

Which she did; as soon as we got back the Pirate came in, for I had his little door keyed to his own *meow* so that he could let himself in and out—the Pirate being a large and rakish tom cat, half red Persian and half travelling salesman. He came in strutting, told me what he thought of people who stayed away so long, then headbumped my ankle in forgiveness. I reached down and roughed him up, then he inspected Mary.

I was watching Mary. She had dropped to her knees and was making the sounds used by people who understand cat protocol, but the Pirate was looking her over suspiciously. Suddenly he jumped into her arms and commenced to buzz like a faulty fuel meter, while bumping her under the chin.

I sighed loudly. "That's a relief," I announced. "For a moment I didn't think I was going to be allowed to keep you."

Mary looked up and smiled. "You need not have worried; I get along with cats. I'm two-thirds cat myself."

"What's the other third?"

She made a face at me. "You'll find out." She was scratching the Pirate under the chin; he was stretching his neck and accepting it, with an expression of indecent and lascivious pleasure. I noticed that her hair just matched his fur.

"Old John takes care of him while I'm away," I explained, "but the Pirate belongs to me—or vice versa."

"I figured that out," Mary answered, "and now I belong to the Pirate, too; don't I, Pirate?"

The cat did not answer but continued his shameless lallygagging—but it was clear that she was right. Truthfully I was relieved; aelurophobes cannot understand why cats matter to aelurophiles, but if Mary had turned out not to be one of the lodge it would have fretted me.

From then on the cat was with us—or with Mary—almost all the time, except when I shut him out of our bedroom. That I would not stand for, though both Mary and the Pirate thought it small of me. We even took him with us when we went down the canyon for target practice. I suggested to Mary that it was safer to leave him behind but she said, "See to it that *you* don't shoot him. I won't."

I shut up, somewhat stung. I am a good shot and remain so by unrelenting practice at every opportunity—even on my honeymoon. No, that's not quite straight; I would have skipped practice on that occasion had it not turned out that Mary really liked to shoot. Mary is not just a good trained shot; she is the real thing, an Annie Oakley. She tried to teach me, but it can't be taught, not that sort of shooting.

I asked why she carried more than one gun. "You might need more than one," she told me. "Here—take my gun away from me."

I went through the motions of a standing, face-to-face disarm, bare hands against gun. She avoided it easily and said sharply, "What are you doing? Disarming me, or asking me to dance? Make it good."

So I made it good. I'll never be a match-medal shot but I stood at the top of my class in barroom. If she had not given in to it, I would have broken her wrist.

I had her gun. Then I realized that a second gun was pressing against my belly button. It was a lady's social gun, but perfectly capable of making two dozen widows without recharging. I looked down, saw that the safety was off, and knew that my beautiful bride had only to tense one muscle to burn a hole through me. Not a wide one, but sufficient.

"Where in the deuce did you find that?" I asked—and well I might, for neither one of us had bothered to dress when we came out. The area was very deserted and often it did not seem worthwhile to take the trouble; it was my land.

So I was much surprised as I would have sworn that the only gun Mary had with her was the one she had carried in her sweet little hand.

"It was high up on my neck, under my hair," she said demurely. "See?" I looked. I knew a phone could be hidden there but I had not thought of it for a gun—though of course I don't use a lady-size weapon and I don't wear my hair in long flame-colored curls.

Then I looked again, for she had a third gun shoved against my ribs. "Where did that one come from?" I asked.

She giggled. "Sheer misdirection; it's been in plain sight all the time." She would not tell me anything further and I never did figure it out. She should have clanked when she walked—but she did not. Oh my, no!

I found I could teach her a few things about hand-to-hand, which salved my pride. Bare hands are more useful than guns anyhow; they will save your life oftener. Not that Mary was not good at it herself; she packed sudden death in each hand and eternal sleep in her feet. However, she had the habit, whenever she lost a fall, of going limp and kissing me. Once, instead of kissing her back, I shook her and told her she was not taking it seriously. Instead of cutting out the nonsense, she continued to remain limp, let her voice go an octave lower, and said, "Don't you realize, my darling, that these are not my weapons?"

I knew that she did not mean that guns *were* her weapons; she meant something older and more primitive. True, she could fight like a bad-tempered Kodiak bear and I respected her for it, but she was no Amazon. An Amazon doesn't look that way with her head on a pillow. Mary's true strength lay in her other talents.

Which reminds me; from her I learned how it was that I was rescued from the slugs. Mary herself had prowled the city for days, not finding me, but reporting accurately the progress with which the city was being "secured". Had she not been able to spot a possessed man, we might have lost many agents fruitlessly—and I might never have gotten free from my master. As a result of the data she brought in, the Old Man drew back and concentrated on the entrances and exits to the city. And I was rescued, though they weren't waiting for me in particular . . . at least I don't suppose they were.

Or maybe they were. Something Mary said led me to think that the Old Man and she had worked watch on and watch off, heel-and-toe, covering the city's main launching platform, once it was evident that there was a focal point active in the city. But that could not have been correct—the Old Man would not have neglected his job to search for one agent. I must have misunderstood her.

I never got a chance to pursue the subject; Mary did not like digging into the past. I asked her once why the Old Man had relieved her as a presidential guard. She said, "I stopped being useful at it," and would not elaborate. She knew that I eventually would learn the reason: that the slugs had found out about sex, thus rendering her no longer useful as a touchstone for possessed males. But I did not know it then; she found the subject repulsive and refused to talk about it. Mary spent less time borrowing trouble than anyone I ever knew.

So little that I almost forgot, during that holiday from the world, what it was we were up against.

Although she would not talk about herself, she let me talk about myself. As I grew still more relaxed and still happier I tried to explain what had been eating me all my life. I told her about resigning from the service and the knocking around I had done before I swallowed my pride and went to work for the Old Man. "I'm a peaceable guy," I told her, "but what's the matter with me? The Old Man is the only one I've ever been able to subordinate myself to—and I still fight with him. Why, Mary? Is there something wrong with me?"

I had my head in her lap; she picked it up and kissed me. "Heavens, boy, don't you know? There's nothing really wrong with you; it's what has been done to you."

"But I've always been that way—until now."

"I know, ever since you were a child. No mother and an arrogantly brilliant father—you've been slapped around so much that you have no confidence in yourself."

Her answer surprised me so much that I reared up. Me? No *confidence* in myself? "Huh?" I said. "How can you say that? I'm the cockiest rooster in the yard."

"Yes. Or you used to be. Things will be better now." And there's where it stood for she took advantage of my change in position to stand up and say, "Let's go look at the sunset."

"Sunset?" I answered. "Can't be—we just finished breakfast." But she was right and I was wrong, a common occurrence.

The mix-up about the time of day jerked me back to reality. "Mary, how long have we been up here? What's the date?"

"Does it matter?"

"You're dam right it matters. It's been more than a week. I'm sure. One of these days our phones will start screaming and then it's back to the treadmill."

"In the meantime what difference does it make?"

She was right but I still wanted to know what day it was. I could have found out by switching on a stereo screen, but I would probably have bumped into a newscast—and I did not want that; I was still pretending that Mary and I were away in a different world, a *safe* world, where titans did not exist. "Mary," I said fretfully, "how many tempus pills have you?"

"None."

"Well—I've got enough for both of us. Let's stretch it out, make it last a long time. Suppose we have just twenty-four more hours; we could fine it down into a month, subjective time."

"No."

"Why not? Let's *carpe* that old *diem* before it gets away from us."

She put a hand on my arm and looked up into my eyes. "No, darling, it's not for me. I must live each moment as it comes and not let it be spoiled by worrying about the moment ahead." I suppose I looked stubborn for she went on, "If you want to take them, I won't mind, but please don't ask me to."

"Confound it. I'm not going on a joy ride alone." She did not answer, which is the damnedest way of winning an argument I know of.

Not that we argued. If I tried to start one—which I did, more than once—Mary would give in and somehow it would work out that I was mistaken. I did try several times to find out more about her; it seemed to me that I ought to know something about the woman I was married to. To one question she looked thoughtful and answered presently, "I sometimes wonder whether I ever did have a childhood—or was it something I dreamed last night?"

I asked her point blank what her name was. "Mary," she said tranquilly.

"Mary really is your name, then?" I had long since told her my right name, but we had agreed to go on using "Sam".

"Certainly it's my name, dear. I've been 'Mary' since you first called me that."

"Oh. All right, your name is Mary. You are my beloved Mary. But what was your name before?"

Her eyes held an odd, hurt look, but she answered steadily, "I was once known as 'Allucquere'."

"'Allucquere'," I repeated, savoring it. "Allucquere. What a strange and beautiful name. Allucquere. It has a rolling majesty about it. My darling Allucquere."

"My name is Mary, now." And that was that. Somewhere, somewhen, I was becoming convinced, Mary had been hurt, badly hurt. But it seemed unlikely that I was ever going to know about it. She had been married before, I was fairly certain; perhaps that was it.

Presently I ceased to worry about it. She was what she was, now and forever, and I was content to bask in the warm light of her presence. "Age cannot wither her nor custom stale her infinite variety."

I went on calling her "Mary" since she obviously preferred it and that was how I thought of her anyhow, but the name that she had once had kept running through my mind. Allucquere . . . Allucquere . . . I rolled it around my tongue and wondered how it was spelled.

Then suddenly I knew how it was spelled. My pesky packrat memory had turned up the right tab and now was pawing away at the shelves in the back of my mind where I keep the useless junk that I don't think about for years on end and am helpless to get rid of. There had been a community, a colony that used an artificial language, even to given names—

The Whitmanites, that was it—the anarchist-pacifist cult that got kicked out of Canada, then failed to make a go of it in Little America. There was a book, written by their prophet. *The Entropy of Joy*—I had not read it but I had skimmed it once; it was full of pseudomathematical formulas for achieving happiness.

Everybody is for "happiness", just as they are against "sin", but the cult's practices kept getting them in hot water. They had a curious and yet very ancient solution to their sexual problems, a solution which appeared to suit them but which produced explosive results when the Whitmanite culture touched any other pattern of behavior. Even Little America had not been far enough away for them; I had heard somewhere that the remnants had emigrated to Venus—in which case they must all be dead by now.

I put it out of my mind. If Mary were a Whitmanite, or had been reared that way, that was her business. I certainly was not going to let the cult's philosophy cause us a crisis now or ever; marriage is not ownership and wives are not property.

If that were all there was to what Mary did not want me to know about her, then I simply would not know it. I had not been looking for virginity wrapped in a sealed package; I had been looking for *Mary*.

XXII

The next time I mentioned tempos pills, she did not argue but suggested that we hold it down to a minimum dose. It was a fair compromise—and we could always take more.

I prepared it as injections so that it would take hold faster. Ordinarily I watch a clock after I've taken tempus; when the second hand stops I know that I'm loaded. But my shack has no clocks and neither of us was wearing ringwatches. It was just sunrise and we had been awake all night, cuddled upon a big low half-moon couch in front of the fireplace.

We continued to lie there for a long time, feeling good and dreamy, and I was half considering the idea that the drug had not worked. Then I realized that the sun had stopped rising. I watched a bird fluttering past the view window. If I stared at him long enough, I could see his wings move.

I looked back from it to my wife, admired the long sweep of her limbs and the sudden, rising curves. The Pirate was curled up on her stomach, a cubical cat, with his paws tucked in as a muff. Both of them seemed asleep. "How about some breakfast?" I said, "I'm starved."

"You fix it," she answered. "If I move, I'll disturb Pirate."

"You promised to love, honor, and fix me breakfast," I replied and tickled the soles of her feet. She gasped and drew up her legs; the cat squawked and landed on the floor.

"Oh dear!" she said, sitting up. "You made me move too fast and now I've offended him."

"Never mind the cat, woman; you're married to me." But I knew that I had made a mistake. In the presence of others, people not under the drug, one should move with great care. I simply hadn't thought about the cat; no doubt he thought we were behaving like drunken jumping jacks. I intentionally slowed down and tried to woo him.

No use—he was streaking toward his door. I could have stopped him, for to me his movement was a molasses crawl, but had I done so I would simply have frightened him more. I let him go and went to the kitchen.

Do you know, Mary was right; tempus fugit drug is no good for honeymoons. The ecstatic happiness that I had felt before was masked by the euphoria of the drug, though I did not feel the loss at the time because the drug's euphoria is compelling. But the loss was real; I had substituted for the true magic a chemical fake.

And there are some precious things which cannot or should not be hurried. Mary was right, as usual. Nevertheless it was a good day—or month, however you care to look at it. But I wished that I had stuck to the real thing.

Late that evening we came out of it. I felt the slight irritability which marks the loosening hold of the drug, found my ringwatch and timed my reflexes. When they were back to normal I timed Mary's, whereupon she informed me that she had been out of it for twenty minutes or so—pretty accurate matching of dosage to have been based on body weights alone.

"Do you want to go under again?" she asked me.

I pulled her to me and kissed her. "No; frankly, I'm glad to be back."

"I'm so glad."

I had the usual ravenous appetite that one has afterward no matter how many times one eats while under; I mentioned it. "In a minute," she said. "I want to call Pirate. He has not been in all day."

I had not missed him during the day—or "month"—just past; the euphoria is like that. "Don't worry about it," I told her. "He often stays out all day."

"He has not before."

"He has with me," I answered.

"I think I offended him—I know I did."

"Then he is probably down at Old John's. That is his usual way of punishing me when he does not like the service. He'll be all right."

"But it's late at night—I'm afraid a coyote might get him."

"Don't be silly; there are no coyotes this far east."

"A fox, then—or something. Do you mind, darling? I'll just step out and call him." She headed for the door.

"Put on something, then," I ordered. "It will be nippy out there."

She hesitated, then went back to the bedroom and got a negligee I had bought for her the day we had gone down to the village. She went out; I put more wood on the fire and went into the kitchen.

She must have left the door dilated for, while I was trying to make up my mind between convenience of a "Soup-to-Nuts" and the pleasure of planning a meal from separate units, I heard her saying, "Bad, bad cat! You worried mama," in that cooing voice suitable for babies and felines.

I called out, "Fetch him in and close the door—and mind the penguins!" She did not answer and I did not hear the door relax, so I went back into the living room.

She was just coming in and did not have the cat with her. I started to speak and then caught sight of her eyes. They were staring, filled with unspeakable horror. I said, "Mary!" and started toward her.

She seemed to see me and turned back toward the door; her movements were jerky, spasmodic. As she turned I saw her shoulders.

Under the negligee was a hump.

I don't know how long I stood there. Probably a split second but it is burned into me as endless. I jumped toward her and grabbed her by the arms. She looked at me and her eyes were no longer wells of horror but merely dead.

She gave me the knee.

I squeezed and managed to avoid the worst of it. Look—I know you don't tackle a dangerous opponent by grabbing his upper arms, but this was my *wife*. I couldn't come at Mary with a feint-shift-and-kill.

But the slug had no compunctions about me. Mary—or *it*—was giving me everything she had and I had all I could do to keep from killing her. I had to keep her from killing me—and I had to kill the slug—and I had to keep the slug from getting at me or I would not be able to save her.

I let go with one hand and jabbed at her chin. The blow should have knocked her out but it did not even slow her down. I grabbed again, with both arms and legs, trying to encase her in a bear hug to immobilize her without injuring her. We went down together, Mary on top. I shoved the top of my head into her face to stop her biting me.

I held her so, curbing her strong body by sheer bulk of muscle. Then I tried to paralyze her with nerve pressure, but she knew what I was up to, knew the key spots as well as I did—and I was lucky that I was not myself paralyzed.

There was one thing left that I could do: clutch the slug itself—but I knew the shattering effect that had on the host. It might not kill her; again it might. It was sure to hurt her horribly. I wanted to make her unconscious, then remove the slug gently before I killed it . . . drive it off with heat or force it to turn loose with mild shocks.

Drive it off with heat—

But I was given no time to develop the idea; she got her teeth in my ear. I shifted my right arm and grabbed at the slug. Nothing happened. Instead of sinking my fingers into a slimy mess I found that this slug had a horny, leathery covering; it was as if I had clutched a football. Mary jerked when I touched it and took away part of my ear, but there was no bonecrushing spasm; the slug was still alive and in control of her.

I tried to get my fingers under it, to pry it loose; it clung like a suction cup. My fingers would not go under.

In the meantime I was suffering damages in other places. I rolled over and got to my knees, still hugging her. I had to let her legs free and that was bad, but I bent her across a knee and then struggled to my feet. I dragged and carried her to the fireplace.

She knew what I was doing and almost got away from me; it was like trying to wrestle a mountain lion. But I got her there, grabbed her by her mop of hair and slowly forced her shoulders over the fire.

I meant—I swear that I meant only to singe it, force it to drop off to escape that heat. But she struggled so hard that I slipped, banging my own head against the arch of the opening and dropping her shoulders against the coals.

She screamed and bounded out of the fire, carrying me with her. I struggled to my feet, still dazed by the wallop I had taken in the head, and saw her collapsed on the floor. Her hair, her beautiful hair, was burning.

So was her negligee. I slapped at them both with my hands. The slug was no longer on her. Still crushing the flames with my hands I glanced around and saw it lying on the floor in front of the fireplace—and the Pirate was sniffing at it.

"Get away from there!" I yelled. "Pirate! Stop that!" The cat looked up inquiringly, as if this were some new and interesting game. I went on doing what I had to do, making absolutely certain that the fire was out, both hair and clothing. When I was sure, I left her; there was not even time to make certain that she was still alive. There was something more urgent to do.

What I wanted was the fireplace shovel; I did not dare risk touching the thing with my hands. I turned to get the shovel.

But the slug was no longer on the floor; it had gotten Pirate. The cat was standing rigid, feet wide apart, and the slug was settling into place.

Perhaps it would have been better had I been a few seconds later; perhaps the slug, mounted on the cat, would have escaped outdoors. I would not have pursued it into the dark. I don't think I would have. But I dived at Pirate and got him by his hind legs just as he made his first controlled movement.

Handling a frenzied, full-grown cat with bare hands is reckless at best; controlling one which is already controlled by a titan is impossible. Hands and arms being slashed by claws and teeth at every step, I hurried again to the fireplace.

This time I made sure. Despite Pirate's wails and struggles I forced the slug against the coals and held it there, cat fur and my hands alike burning, until the slug dropped off directly into the flames. Then I took Pirate out and laid him on the floor. He was no longer struggling. I did for him what I had done for Mary, made sure that he was no longer burning anywhere and went back to Mary.

She was still unconscious. I squatted down beside her and sobbed.

An hour later I had done what I could for Mary. Her hair was almost gone from the left side of her head and there were burns on her shoulders and neck. But her pulse was strong, her respiration steady though fast and light, and I did not judge that she would lose much body fluid. I dressed her burns—I keep a rather full stock out there in the country—and gave her an injection to make her sleep. Then I had time for Pirate.

He was still on the floor where I had left him and he did not look good. He had gotten it much worse than Mary and probably flame in his lungs as well. I thought he was dead, but he lifted his head when I touched him. "I'm sorry, old fellow," I whispered. I think I heard him mew.

I did for him what I had done for Mary, except that I was afraid to give him a soporific. After that I went into the bathroom and looked myself over.

The ear had stopped bleeding and I decided to ignore it, for the time being. Someday, when I had time, it would need to be rebuilt. My hands were what bothered me. I stuck them under hot water and yelped, then dried them in the air blast and that hurt, too. I could not figure out how I could dress them, and, besides, I needed to use them.

Finally I dumped about an ounce of the jelly for burns into each of a pair of plastic gloves and put them on. The stuff included a local anesthetic; I could get by. Then I went to the stereophone and called the village medical man. I explained to him carefully and correctly what had happened and what I had done about it and asked him to come at once.

"At *night*?" he said. "You must be joking."

I said that I decidedly was not joking.

He answered, "Don't ask the impossible, man. Yours makes the fourth alarm in this county; nobody goes out at night. You've done everything that can be done tonight; I'll stop in and see your wife first thing in the morning."

I told him to go straight to the devil first thing in the morning and switched off.

Pirate died a little after midnight. I buried him at once so that Mary would not see him. Digging hurt my hands but he did not take a very big hole. I said goodbye to him and came back in. Mary was resting quietly; I brought a chair to the bed and watched over her. Probably I dozed from time to time; I can't be sure.

XXIII

About dawn Mary began to struggle and moan. I stepped to the bed and put a hand on her. "There, baby, there—It's all right. Sam's here."

Her eyes opened and for a moment held the same horror they had held when she was first possessed. Then she saw me and relaxed. "Sam! Oh, darling, I've had the most terrible dream."

"It's all right," I repeated.

"Why are you wearing gloves?" She became aware of her own dressings; she looked dismayed and said, "It wasn't a dream!"

"No, dearest, it wasn't a dream. But it's all right; I killed it."

"You killed it? You're sure it's dead?"

"Quite sure." The house still reeked with the stench of its dying.

"Oh. Come here, Sam. Hold me tight."

"I'll hurt your shoulders."

"Hold me!" So I did, while trying to be careful of her burns, although she seemed indifferent to them. Presently her trembling slowed down and stopped almost completely. "Forgive me, darling—I'm being weak and womanish."

"You should have seen the shape I was in when they got me back."

"I did see. Now tell me what happened; I must know. The last I remember you were trying to force me into the fireplace."

"Look. Mary, I couldn't help it; I had to—I couldn't get it off!"

She shook my shoulders and now it was she comforting me. "I know, darling, I know—and thank you for doing it! Thank you from the bottom of my heart. Again I owe you everything."

We both cried a bit and presently I blew my nose and went on, "You did not answer when I called you, so I went into the living room and there you were."

"I remember—oh darling, I tried so hard!"

I stared at her. "I know you did—you tried to leave. But how did you? Once a slug gets you, that's it. There's no way to fight it."

"Well, I lost—but I tried." There was no answer to the mystery. Somehow, Mary had forced her will against that of a parasite—and that can't be done. I *know*. True, she had succumbed, but I knew then that I was married to a human who was tougher and stronger than I was, despite her lovely curves and her complete femininity.

I had a sneaking hunch that had Mary not been able to resist the slug by some amount, however slight, I would have lost the struggle, handicapped as I was by what I could not do.

"I should have used a light, Sam," she went on, "but it never occurred to me to be afraid *here*." I nodded; this was the safe place, like crawling into bed or into sheltering arms. "Pirate came to me at once. I didn't see the thing until I had reached down and touched him. Then it was too late." She sat up, supporting herself on one arm. "Where is he, Sam? Is he all right? Call him in."

So I had to tell her about Pirate. She listened without expression, nodded and never referred to him again. I changed the subject by saying, "Now that you are awake I had better fix you some breakfast."

"*Don't go*!" I stopped. "Don't go out of my sight at all," she went on, "Not for any reason. I'll get up in a moment and get breakfast."

"The hell you will. You'll stay right in that bed, like a good little girl."

"Come here and take off those gloves. I want to see your hands." I did not take them off—could not bear to think about it; the anesthesia had worn off. She nodded and said grimly, "Just as I thought. You were burned worse than I was."

So she got breakfast. Furthermore she ate—I wanted nothing but a pot of coffee. I did insist that she drink a lot, too; large area burns are no joke. Presently she pushed aside her plate, looked at me and said, "Darling, I'm not sorry it happened. Now I know. Now we've both been there." I nodded humbly, knowing what she meant. Sharing happiness is not enough. She stood up and said, "Now we must go."

"Yes," I agreed, "now we must go. I want to get you to a doctor as soon as possible."

"I did not mean that."

"I know you didn't." There was no need to discuss it further; we both knew that the music had stopped and that now was time to go back to work. The heap we had arrived in was still sitting on my landing flat, piling up rental charges. It took about three minutes to burn the dishes, switch off everything but the permanent circuits, and get ready. I could not find my shoes but Mary remembered where I had left them.

Mary drove, because of my hands. Once in the air she turned to me and said, "Let's go straight to the Section offices. We'll get treatment there and find out what has been going on—or are your hands hurting too badly?"

"Suits," I agreed. My hands were hurting but they would not be any worse for another hour of waiting. I wanted to learn the situation as soon as possible—and I wanted to get back to work. I asked Mary to switch on the squawk screen; I was as anxious to catch a newscast now as I had been anxious to avoid them before. But the car's communication equipment was as junky as the rest of it; we could not even pick up audio. Fortunately the remote-control circuits were still okay, or Mary would have had to buck it through traffic by hand.

A thought had been fretting me for some time; I mentioned it to Mary. "A slug would not mount a cat just for the hell of it, would it?"

"I suppose not."

"But *why*? It doesn't make sense. But it *has* to make sense; everything they do makes sense, grisly sense, from their viewpoint."

"But it did make sense. They caught a human that way."

"Yes, I know. But how could they plan it? Surely there aren't enough of them that they can afford to place themselves on cats on the off chance that the cat might catch a human. Or are there enough?" I remembered the speed with which a slug on an ape's back had turned itself into two, I remembered Kansas City, saturated, and shivered.

"Why ask me, darling? I don't have an analytical brain." Which was true, in a way; there is nothing wrong with Mary's brain but she jumps logic and arrives at her answers by instinct. Me, I have to worry it out by logic.

"Drop the modest little girl act and try this on for size: the first question is, 'Where did the slug come from?' It didn't walk; it had to get to the Pirate on the back of another host. What host? I'd say it was Old John—John the Goat. I doubt if Pirate would have let any other human get close to him."

"Old John?" Mary closed her eyes, then opened them. "I can't get any feeling about it. I was never close to him."

"It does not matter; by elimination I think it must be true. Old John wore a coat when everyone else was complying with the Bare Back order . . . getting away with it because he shuns people. Ergo, he was hag-ridden before Schedule Bare Back. But that does not get me any further. Why would a slug single out a hermit way up in the mountains?"

"To capture you."

"Me?"

"To *recapture* you."

It made some sense. Possibly any host that ever escaped them was a marked man; in that case the dozen-odd Congressmen and any others we had rescued—including Mary—were in special danger. I'd mark that down to report for analysis. No, not Mary—the only slug that knew she had been possessed was dead.

On the other hand they might want me in particular. What was special about me? I was a secret agent. More important, the slug that had ridden me must have known what I knew about the Old Man and known that I had access to him. That would be reason enough to try to get me back. I held an emotional certainty that the Old Man was their principal antagonist; the slug must have known that I thought so; he had full use of my mind.

That slug had even met the Old Man, talked with him. Wait a minute—that slug was dead. And my theory came tumbling down.

And built up again at once. "Mary," I asked, "have you used your apartment since the morning you and I had breakfast there?"

"No. Why?"

"Don't. Don't go back there for any purpose. I recall thinking, while I was with *them*, that I would have to boobytrap it."

"Well, you didn't, did you? Or did you?"

"No, I did not. But it may have been booby-trapped since then. There may be the equivalent of Old John waiting, spider fashion, for you—or me—to return there." I explained to her McIlvaine's theory about the slugs, the "group memory" idea. "I thought at the time he was spinning the dream stuff scientists are so fond of. But now I don't know; it's the only hypothesis I can think of that covers everything . . . unless we assume that the titans are so stupid that they would as soon try to catch fish in a bathtub as in a brook. Which they aren't."

"Just a moment, dear—by Dr. McIlvaine's theory each slug is really every other slug; is that it? In other words that *thing* that caught me last night was just as much the one that rode you when you were with them as was the one that actually did ride you—Oh, dear, I'm getting confused. I mean—"

"That's the general idea. Apart, they are individuals; in direct conference they merge their memories and Tweedledum becomes exactly like Tweedledee. Then, if that is true, this one last night remembers everything it learned from me provided it had direct conference with the slug that rode me, or any other slug that had had, or a slug that had been linked through any number of slugs by direct conference to the slug that had ridden me, after the time it did—which you can bet it did, from what I know of their habits. It would have—the first one, I mean . . . wait a minute; this is getting involved. Take three slugs; Joe, Moe, and uh, Herbert. Herbert is the one last night; Moe is the one which—"

"Why give them names if they are not individuals?" Mary wanted to know.

"Just to keep them— No reason; let it lie that if McIlvaine is right there are hundreds of thousands, maybe millions, of slugs who know exactly who you and I are, by name and by sight and everything, know where your apartment is, where my apartment is, and where our cabin is. They've got us on a list."

"But—" She frowned. "That's a horrid thought, Sam. How would they know when to find us at the cabin? You didn't tell anybody we were going and I did not even know. Would they simply stake it out and wait? Yes, I suppose they would."

"They must have. We don't know that waiting matters to a slug; time may mean something entirely different to them."

"Like Venerians," she suggested. I nodded; a Venerian is likely as not to "marry" his own great-great-granddaughter—and be younger than his descendants. It depends on how they estivate, of course.

"In any case," I went on, "I've got to report this, including our guesses as to what is behind it, for the boys in the analytical group to play with."

I was about to go on to say that, if we were right, the Old Man would have to be especially careful, as it was he and not Mary and myself that they were after. But my phone sounded for the first time since my leave had started. I answered and the Old Man's voice cut in ahead of the talker's: "Report in person."

"We're on our way," I acknowledged. "About thirty minutes."

"Make it sooner. You use Kay Five; tell Mary to come in by Ell One. Move." He switched off before I could ask him how he had known that Mary was with me.

"Did you get it?" I asked Mary.

"Yes, I was in the circuit."

"Sounds as if the party was about to start."

It was not until we had landed that I began to realize how drastically the situation had changed. We were complying with Schedule Bare Back; we had not heard of Schedule Sun Tan. Two cops stopped us as we got out. "Stay where you are!" one of them ordered. "Don't make any sudden moves."

You would not have known they were cops, except for the manner and the drawn guns. They were dressed in gun belts, shoes, and skimpy breech clouts—little more than straps. A second glance showed their shields clipped to their belts. "Now," the same one went on, "Off with those pants, buddy."

I did not move quickly enough to suit him. He barked, "Make it snappy! There have been two shot trying to escape already today; you may be the third." "Do it, Sam," Mary said quietly. I did it. My shorts were a one-piece garment, with the underwear part built in; without them, I stood dressed in my shoes and a pair of gloves, feeling like a fool—but I had managed to keep both my phone and my gun covered up as I took off my shorts.

The cop made me turn around. His mate said, "He's clean. Now the other one." I started to put my shorts back on and the first cop stopped me.

"Hey! You looking for trouble? Leave 'em off."

I said reasonably, "You've searched me. I don't want to get picked up for indecent exposure."

He looked surprised, then guffawed and turned to his mate. "You hear that. Ski? He's afraid he'll be arrested for indecent exposure."

The second one said patiently, "Listen, yokel, you got to cooperate, see? You know the rules. You can wear a fur coat for all of me—but you won't get picked up for indecent exposure; you'll get picked up DOA. The Vigilantes are a lot quicker to shoot than we are." He turned to Mary. "Now, lady, if you please."

Without argument Mary started to remove her shorts. The second cop said kindly, "That isn't necessary lady, not the way those things are built. Just turn around slowly."

"Thank you," Mary said and complied. The policeman's point was well taken; Mary's briefies appeared to have been sprayed on, and her halter also quite evidently contained nothing but Mary.

"How about those bandages?" the first one commented. "Her clothes sure can't cover anything." I thought, brother, how wrong you are; I'll bet she's packing at least two guns this minute, besides the one in her purse—and I'll bet one of them is ready to heat up quicker than yours! But what I said was,

"She's been badly burned. Can't you see that?" He looked doubtfully at the sloppy job I had done on the dressings; I had worked on the principle that, if a little is good, more is better, and the dressing across her shoulders where she had been burned the worst undoubtedly could have concealed a slug, if that had been the purpose. "Mmmm . . ." he said, "*If* she was burned."

"Of course she was burned!" I felt my judgment slipping away; I was the perfect heavy husband, unreasonable where my wife was concerned. I knew it—and I liked it that way. "Damn it, look at her hair! Would she ruin a head of hair like that just to fool you?"

The first cop said darkly, "One of *them* would."

The more patient one said, "Carl is right. I'm sorry, lady; we'll have to disturb those bandages."

I said excitedly, "You can't do that! We're on our way to a doctor. You'll just—"

Mary said, "Help me, Sam. I can't take them off myself."

I shut up and started to peel up one corner of the big dressing, my hands trembling with rage. Presently the older, more kindly one whistled and said, "I'm satisfied. How about you, Carl?"

"Me, too. Ski. Gripes, girlie, it looks like somebody tried to barbecue you. What happened?"

"Tell them, Sam."

So I did. The older cop finally commented, "I'd say you got off easy—no offense, madam. So it's cats, now, eh? Dogs I knew about. Horses, yes. But cats—you wouldn't think the ordinary cats could carry one." His face clouded. "We got a cat and now we'll have to get rid of it. My kids won't like that."

"I'm sorry," Mary told him and sounded as if she meant it.

"It's a bad time for everybody. Okay, folks, you can go—"

"Wait a minute," the first one said. "Ski, if she goes through the streets with that thing on her back somebody is likely to burn her."

The older one scratched his chin. "That's true," he said to Mary. "I'd say you couldn't stand to have that dressing off. We'll just have to dig up a prowl car for you."

Which they did—one was just landing and they hailed it. I had to pay the charges on the rented wreck, then I went along, as far as Mary's entrance. It was in a hotel, through a private elevator; I got in with her to avoid explanations, then went back up after she had gotten out at a level lower than the obvious controls of the car provided for. I was tempted to go on in with her, but the Old Man had ordered me to come in by Kay Five, so Kay Five it was.

I was tempted, too, to put my shorts back on. In the prowl car and during a quick march through a side door of the hotel, with police around us to keep Mary from being shot, I had not minded so much—but it took nerve to step out of the elevator and face the world without pants.

I need not have worried. The short distance I had to go was enough to show me that a fundamental custom had gone with last year's frost. Most men were wearing straps—codpieces, really—as the cops had been, but I was not the only man in New Brooklyn stark naked to his shoes. One in particular I remember; he was leaning against a street roof stanchion and searching with cold eyes every passer-by. He was wearing nothing but slippers and a brassard lettered with "VIG"—and he was carrying an Owens mob gun under his arm.

I saw three more like him before I reached Kay Five; I was glad that I was carrying my shorts.

Some women were naked, some were not—but those who were not might as well have been—string brassieres, translucent plastic trunks, nothing that could possibly hide a slug.

Most of the women, I decided, would have looked better in clothes, preferably togas. If this was what the preachers had been worrying about all these years, then they had been barking up the wrong tree; it was nothing to arouse the happy old beast in men. The total effect was depressing. That was my first impression—but before I got to my destination even that had worn off. Ugly bodies weren't any more noticeable than ugly taxicabs; the eye discounted them automatically. And so it appeared to be with everybody else, too; those on the streets seemed to have acquired utter indifference. Maybe Schedule Bare Back got them ready for it.

One thing I did not notice consciously until much later: after the first block I was unaware of my own nakedness. I noticed other people long after I had forgotten my own bare skin. Somehow, some way, the American community had been all wrong about the modesty taboo and had been wrong for centuries.

When tackled firmly, it was as empty as the ghost that turns out to be a flapping window drape. It did not mean a thing, either pro or con, moral or immoral. Skin was skin and what of it?

I was let in to see the Old Man at once. He looked up and growled, "You're late."

I answered, "Where's Mary?"

"In the infirmary, getting treated and dictating her report. Let's see your hands."

"I'll show them to the doctor, thanks," I replied, making no move to take off the gloves. "What's up?"

"If you would ever bother to listen to a newscast," he grumbled, "you would know what was up."

XXIV

I'm glad I had not looked at a newscast; our honeymoon would never have gotten to first base. While Mary and I had each been telling the other how wonderful the other one was the war had almost been lost—and I was not sure about that "almost". My suspicion that the slugs could, if necessary, hide themselves on any part of the body and still control hosts had proved to be right—but I had guessed that from my own experience on the streets. It had been proved by experiments at the National Zoo before Mary and I had holed up on the mountain, although I had not seen the report. I suppose the Old Man knew it; certainly the President knew it and the other top VIPs.

So Schedule Sun Tan replaced Schedule Bare Back and everybody skinned down to the buff.

Like hell they did! The matter was still "Top Secret" and the subject of cabinet debates at the time of the Scranton Riot. Don't ask me why it was top secret, or even restricted; our government has gotten the habit of classifying anything as secret which the all-wise statesmen and bureaucrats decide we are not big enough boys and girls to know, a Mother-Knows-Best-Dear policy. I've read that there used to be a time when a taxpayer could demand the facts on anything and get them. I don't know; it sounds Utopian.

The Scranton Riot should have convinced anybody that the slugs were loose in Zone Green despite Schedule Bare Back, but even that did not bring on Schedule Sun Tan. The fake air-raid alarm on the east coast took place, as I figure it, the third day of our honeymoon; there had not been any special excitement in the village when we visited it the day before that and certainly no vigilante activity. After the false air-raid alarm it took a while to figure out what had happened, even though it was obvious that lighting could not fail by accident in so many different shelters.

It gives me the leaping horrors to think about it even now—all those people crouching in the darkness, waiting for the all-clear, while zombies moved among them, slapping slugs on them. Apparently in some air raid bunkers the recruitment was one hundred percent. They did not have a chance.

So there were more riots the next day and we were well into the Terror, though we did not know it. Technically, the start of vigilantism came the first time a desperate citizen pulled a gun on a cop—Maurice T. Kaufman of Albany and the cop was Sergeant Malcolm MacDonald. Kaufman was dead a half second later and MacDonald followed him in a few minutes, torn to pieces by the mob, along with his titan master. But the Vigilantes did not really get going until the air-raid wardens put organization into the movement.

The wardens, being mostly aboveground at the time the coup in the bunkers took place, largely escaped—but they felt responsible. Not that all Vigilantes were wardens, nor all wardens Vigilantes—but a stark naked, armed man on the street was as likely to be wearing a warden's armband as the "VIG" brassard. Either way, you could count on him shooting at any unexplained excrescence on a human body—shoot and investigate afterward.

While my hands were being treated and dressed I was brought up to date concerning the period (it turned out to be two weeks) that Mary and I had spent at the cabin. By the Old Man's orders the doctor gave me a short shot of tempus before he worked on me and I spent the time—subjective, about three days; objective, less than an hour—studying stereo tapes through an overspeed scanner. This gadget has never been released to the public, though I have heard that it is bootlegged at some of the colleges around examination week. You adjust the speed to match your subjective time rate, or a little faster, and use an audio frequency step-down to let you hear what is being said. It is hard on the eyes and usually results in a splitting headache—but it is a big help in my profession.

It was hard to believe that so much could have happened in so short a time. Take dogs. A Vigilante would kill a dog on sight, even though it was not wearing a slug—because it was even money that it would be wearing one before next sunrise, that it would attack a man and that the titan would change riders in the dark.

A hell of a world where you could not trust dogs!

Apparently cats were hardly ever used because of their smaller size. Poor old Pirate was an exceptional case.

In Zone Green dogs were almost never seen now, at least by day. They filtered out of Zone Red at night, traveled in the dark and hid out in the daytime. They kept showing up, even on the coasts. It made one think of the werewolf legends. I made a mental note to apologize to the village doctor who had refused to come to see Mary at night—after I pasted him one.

I scanned dozens of tapes which had been monitored from Zone Red; they fell into three time groups: the masquerade period, when the slugs had been continuing the "normal" broadcasts; a short period of counter-propaganda during which the slugs had tried to convince citizens in Zone Green that the government had gone crazy—it had not worked as we had not relayed their casts, just as they had not relayed the President's proclamation—and, finally, the current period in which pretense had been dropped, the masquerade abandoned.

According to Dr. McIlvaine the titans have no true culture of their own; they are parasitic even in that and merely adapt the culture they find to their own needs. Maybe he assumes too much, but that is what they did in Zone Red. The slugs would have to maintain the basic economic activity of their victims since the slugs themselves would starve if the hosts starved. To be sure, they continued that economy with variations that we would not use—that business of processing damaged and excess people in fertilizer plants, for example—but in general farmers stayed farmers, mechanics went on being mechanics, and bankers were still bankers. That last seems silly, but the experts claim that any "division-of-labor" economy requires an accounting system, a "money" system.

I know myself that they use money behind the Curtain, so he may be right—but I never heard of "bankers" or "money" among ants or termites. However, there may be lots of things I've never heard of.

It is not so obvious why they continued human recreations. Is the desire to be amused a universal need? Or did they learn it from us? The "experts" on each side of the argument are equally emphatic—and I don't know. What they picked from human ideas of fun to keep and "improve on" does not speak well for the human race although some of their variations may have merit—that stunt that they pulled in Mexico, for example, of giving the bull an even break with the matador.

But most of it just makes one sick at the stomach and I won't elaborate. I am one of the few who saw even transcriptions on such things, except for foolhardy folk who still held out in Zone Amber; I saw them professionally. The government monitored all stereocasts from Zone Red but the transcriptions were suppressed under the old Comstock "Indecency" Law—another example of "Mother-Knows-Best", though perhaps Mother did know best in this case. I hope that Mary, in her briefing, did not have to look at such things, but Mary would never say so if she had.

Or perhaps "Mother" did *not* "Know Best"; if anything more could have added to the determination of men still free to destroy this foul thing it would have been the "entertainment" stereocast from stations inside Zone Red. I recall a boxing match cast from the Will Rogers Memorial Auditorium at Fort Worth—or perhaps you would call it a wrestling match. In any case there was a ring and a referee and two contestants pitted against each other. There were even fouls, i.e., doing anything which might damage the opponent's manager—I mean "master", the opponent's slug.

Nothing else was a foul—nothing! It was a man versus a woman, both of them big and husky. She gouged out one of his eyes in the first clinch, but he broke her left wrist which kept the match on even enough terms to continue. It ended only when one of them had been so weakened by loss of blood that the puppet master could no longer make the slave dance. The woman lost—and died, I am sure, for her left breast was almost torn away and she had bled so much that only immediate surgery and massive transfusions could have saved her. Which she did not get; the slugs were transferred to new hosts at the end of the match and the inert contenders were dragged out.

But the male slave had remained active a little longer than the female, slashed and damaged though he was, and he finished the match with a final act of triumph over her which I soon learned was customary. It seemed to be a signal to turn it into an "audience participation show", an orgy which would make a witches' Sabbat seem like a sewing circle.

Oh, the slugs had discovered sex, all right!

There was one more thing which I saw in this and other tapes, a thing so outrageous, so damnably disgusting that I hesitate even to mention it, though I feel I must—there were men and women here and there among the slaves, humans (if you could call them that) without slugs . . . trusties . . . renegades—

I hate slugs but I would turn from killing a slug to kill one such. Our ancestors believed that there were men who would willingly sign compacts with the Devil; our ancestors were partly right: there are men who *would*, given the chance.

Some people refuse to believe that any human being turned renegade; those who disbelieve did not see the suppressed transcriptions. There was no chance for mistake; as everyone knows, once the masquerade was no longer useful to the slugs, the wearing of clothes was dropped in Zone Red even more thoroughly than it was under Schedule Sun Tan in Zone Green; one could see. In the Fort Worth horror which I have faintly sketched above the referee was a renegade; he was much in the camera and I was able to be absolutely sure. I knew him by sight, a well-known amateur sportsman, a "gentleman" referee. I shan't mention his name, not to protect him but to protect myself; later on I killed him.

We were losing ground everywhere; that I knew before they finished treating my hands. Ours was a holding action only; our methods were effective only in stopping the spread of the infection and not fully effective in that. To fight them directly we would have to fight our own people, bomb our own cities, with no certainty of killing the humps. What we needed was a selective weapon, one that would kill slugs but not men, or something that would disable humans or render unconscious without killing and thereby permit us to rescue our compatriots. No such weapon was available, though the scientists were all busy on the problem, from the comedy team of McIlvaine & Vargas down to the lowliest bottle-washer in the Bureau of Standards. A "sleep" gas would have been perfect, but it is lucky that no such gas was known before the invasion, or the slugs could have used it against us; it would have cut both ways. It must be remembered that the slugs then had as much, or more, of the military potential of the United States at their disposal as had the free men.

Stalemate—with time on the side of the enemy. There were the fools who wanted to H-bomb the cities of the Mississippi Valley right out of existence, like curing a lip cancer by cutting off the head, but they were offset by their twins who had not seen slugs, did not believe in slugs, and felt that the whole matter was a violation of states' rights and Schedule Sun Tan a tyrannical Washington plot. These second sort were fewer each day, not because they changed their minds but because the Vigilantes were awfully eager.

Then there was the *tertium quid*, the flexible mind, the "reasonable" man who hardly had a mind to change—he favored negotiation; he thought we could "do business" with the titans. One such committee, a delegation from the caucus of the opposition party in Congress, actually attempted negotiation. Bypassing the State Department they got in touch via a linkage rigged across Zone Amber with the Governor of Missouri, and were assured of safe conduct and diplomatic immunity—"guarantees" from a titan, but they accepted them; they went to St. Louis—and never came back. They sent messages back; I saw one such, a good rousing speech adding up to, "Come on in; the water is fine!"

Do steers sign treaties with meat packers?

North America was still the only known center of infection. The only action by the United Nations, other than placing the space stations at our disposal, was to remove temporarily to Geneva. No aggression by any other nation was involved and it was even argued that the slugs—if they existed—were technically an epidemic disease rather than a potential source of war and therefore of no interest to the Security Council. It was voted, with twentythree nations abstaining, to define it as "civil disorder" and to urge each member nation to give such aid as it saw fit to the legitimate governments of the United States, Mexico, and Canada.

What each might have "seen fit" was academic; we did not know what to ask for.

It remained a creeping war, a silent war, with battles lost before we knew they were joined. After the debacle of Schedule Counter Blast, conventional weapons were hardly used, except in police action in Zone Amber—which was now a double no-man's-land on each side of Zone Red, from the trackless Canadian forests to the Mexican deserts. It was almost deserted in the daytime of any life larger than birds and mice, save for our own patrols. At night our scouts drew back and the dogs came through—and other things, perhaps.

At the time Mary and I arrived back only one atom bomb had been used in the entire war and that against a flying saucer that landed near San Francisco just south of Burlingame. Its destruction was according to doctrine, but the doctrine was now under criticism; the saucer should have been captured for study, so it was argued, if we were to learn enough about our foe to fight successfully. I found my sympathies with those who wanted to shoot first and study later.

By the time the dose of tempus was beginning to wear off I had a picture of the United States in a shape that I had not imagined even when I was in saturated Kansas City—a country undergoing a Terror. Friend might shoot friend, or wife denounce husband. Rumor of a titan could drum up a mob on any street, with Old Judge Lynch baying in their van. To rap on a door at night was to invite a blast through the door rather than a friendly response. Honest folk stayed home; at night the dogs were out—and others.

The fact that most of the rumored discoveries of slugs were baseless made the rumors no less dangerous. It was not exhibitionism which caused many people to prefer outright nudity to the tight and scanty clothing permitted under Schedule Sun Tan; even the skimpiest clothing invited a doubtful second look, a suspicion that might be decided too abruptly. The head-and-spine armor was never worn now; the slugs had faked it and used it almost at once. And there had been the case of a girl in Seattle; she had been dressed in sandals and a big purse, nothing else—but a Vigilante who apparently had developed a nose for the enemy followed her and noticed that she never, under any circumstances, moved the purse from her right hand, even when she opened it to make change.

She lived, for he burned her arm off at the wrist, and I suppose that she had a new one grafted on; the supply of such spare parts was almost a glut. The slug was alive, too, when the Vigilante opened the purse—but not for long.

When I came across this in the briefing I realized with a shudder that I had not been too safe even in *carrying* my shorts through the streets; any slug-sized burden was open to suspicion.

The drug had worn off by the time I scanned this incident and I was back in contact with my surroundings. I mentioned the matter to the nurse. "Mustn't worry," she told me. "It does no good. Now flex the fingers of your right hand, please."

I flexed them, while she helped the doctor spray on surrogate skin. I noticed that she was taking no chances; she wore no bra at all and her so-to-speak shorts were actually more of a Gstring. The doctor was dressed about the same. "Wear gloves for rough work," the doctor cautioned, "and come back next week."

I thanked them and went to the operations office. I looked for Mary first, but found that she was busy in Cosmetics.

XXV

Hands all right?" the Old Man asked when they let me in.

"They'll do. False skin for a week. They do a graft job on my ear tomorrow."

He looked vexed. "I forgot your ear. There's no time for a graft to heal; Cosmetics will have to fake one for you."

"The ear doesn't matter," I told him, "but why bother to fake it? Impersonation job?"

"Not exactly. Now that you've been briefed, what do you think of the situation?"

I wondered what answer he was fishing for. "Not good," I conceded. "Everybody watching everybody else. Might as well be behind the Curtain. Shucks," I admitted, going overboard, "this is worse. You can usually bribe a communist, but what bribe can you offer a slug?"

"Hmm—" he commented. "That's an interesting thought. What would constitute a bribe inducement to a titan?"

"Look, that was a rhetorical question. I—"

"And my restatement of it was not rhetorical; we'll farm it out for theoretical investigation."

"Grabbing at straws these days, aren't you?"

"Precisely. Now about the rest of your comment; would you say that it was easier to penetrate and maintain surveillance in the Soviet Union or in Zone Red. Which would you rather tackle?"

I eyed him suspiciously. "There's a catch in this. You don't let a man pick his assignment."

"I asked you for a professional opinion."

"Mmmm . . . I don't have enough data. Tell me; are there slugs behind the Curtain?"

"That," he answered, "is just what I would like to find out."

I realized suddenly that Mary had been right; agents should not marry. If this job were ever finished, I wanted to hire out to count sheep for a rich insomniac or, something equally soft. "This time of year," I said, "I think I'd want to enter through Canton. Unless you were figuring on a drop?"

"What makes you think I want you to go into the USSR?" he asked. "We might find out what we want to know quicker and easier in Zone Red."

"Huh?"

"Certainly. If there is infection anywhere but in this continent, the titans in Zone Red must know about it. Why go half around the globe to find out?"

I put aside the plans I had been forming to be a Hindu merchant, travelling with his wife, and thought about what he was saying. Could be . . . could be. "How in the devil can Zone Red be penetrated now?" I asked. "Do I wear a plastic imitation slug on my shoulder blades? They'd catch me the first time I was called on for direct conference. Or before."

"Don't be a defeatist. Four agents have gone in already."

"And come back?"

"Well, no, not exactly. That's the rub."

"And you want me to be the fifth? Have you decided that I've cluttered up the payroll long enough?"

"I think the others used the wrong tactics—"

"Obviously!"

"The trick is to convince them that you are a renegade. Got any ideas?"

The idea was overwhelming, so much so that I did not answer at once. Finally I burst out, "Why not start me easy? Can't I impersonate a Panama pimp for a while? Or practice being an ax murderer? I have to get into the mood for this."

"Easy," he said. "It may not be practical—"

"*Hmmph*!"

"But you might bring it off. You've had more experience with their ways than any agent I've got. You must be rested up, aside from that little singe you got on your fingers. Or maybe we should drop you near Moscow and let you take a direct look. Think it over. Don't get into a fret about it for maybe another day."

"Thanks. Thank you too much." I changed the subject. "What have you got planned for Mary?"

"Why don't you stick to your own business?"

"I'm married to her."

"Yes."

"Well, for the love of Pete! Is that all you've got to say? Don't you even want to wish me luck?"

"It strikes me," he said slowly, "that you have had all the luck one man could ask for. You have my blessing, for whatever it's worth."

"Oh. Well, thanks." I am slow in some ways, but I plead the excuse that I had had much on my mind—up to that moment it had not occurred to me that the Old Man might have had something directly to do with Mary's leave and mine falling together so conveniently. I said, "Look here. Dad—"

"*Huh*?" It was the second time I had called him that in a month; it seemed to put him on the defensive.

"You meant for Mary and me to marry all along. You planned it that way."

"Eh? Don't be ridiculous. I believe in free will, son—and free choices."

"Provided the choice suits you."

"See here, we discussed this once before—"

"I know we did. Never mind; I'm hardly in a position to be angry about it. It's just that I feel like a prize stallion being led into the pen. Why did you do it? It wasn't sentiment about 'young love' and such twaddle; I know you better than that."

"I did not do anything, I tell you. As for approving of it—well, the race must go on, so they tell me. If it doesn't, everything else we do is pointless—even this war."

"Like that, eh? You would send two agents on leave in the middle of a battle—to catch yourself a grandson?" I did a rapid summing up and added, "I'll bet you used a slide rule."

He colored. "I don't know what you are talking about. You both were entitled to leave; the rest was accidental."

"Hmm! Accidents don't happen; not around you. Never mind; I'm a willing victim. Now about the job; give me a bit longer to size up the possibilities, if you really mean to let me pick my own method. Meantime, I'll see Cosmetics about a rubber ear."

I did not see a man about an ear, not then, for, as I was heading into Cosmetics, I met Mary coming out. I had not intended to let myself be surprised into endearments around the Section, but I was caught off guard. "Darling! They fixed you!"

She turned slowly around and let me look. "Good job, isn't it?"

It *was* a good job. I could not tell that her hair had ever been burned. Besides that, they had done a make-up job on her shoulders over the temporary skin that was quite convincing, but I had expected that. It was the hair that fooled me. I touched it gently and examined the hair line on the left side. "They must have taken it all off and started fresh."

"No, they simply matched it."

"Now you've got your favorite gun cache back."

"Like this?" she said, dimpling. She adjusted her curls with her left hand—then suddenly she had a gun in each hand. And again I did not know where the second one had come from.

"That's papa's good girl! If you ever have to, you can make a living as a nightclub magician. But seriously—don't let a Vigilante catch you doing that trick; he might get jumpy."

"One won't catch me," she assured me solemnly. I wondered about the verb. We went to the staff lounge and found a quiet place to talk. We did not order drinks; we did not seem to need such. We talked over the situation and found that each had been briefed. I did not tell Mary about my proposed assignment, and, if she had one, she did not mention it; we were back with the Section and indoctrinated habits are hard to break.

"Mary," I said suddenly, "are you pregnant?"

"It's too early to tell, dear," she answered, searching my eyes. "Do you want me to be?"

"Yes."

"Then I'll try very hard to be."

XXVI

We finally decided to attempt to penetrate the Curtain rather than Zone Red. The evaluation group had advised that there was no chance of impersonating a renegade; their advice would not have stopped the Old Man, but it agreed with his opinion and mine. The question hinged on, "How does a man get to be a renegade? Why do the titans trust him?"

The question answers itself; a slug knows its host's mind. Verbal guarantees would mean nothing to a titan—but if the titan, through once possessing a man's mind, *knows* that he is a natural renegade, a man who can be had, then it may suit the slug's purposes to let him be renegade rather than host. But first the slug had to plumb the vileness in the man's mind and be sure of its quality.

We did not know this as fact but as logical necessity. Human logic—but it had to be slug logic, too, since it fitted what the slugs could and could not do. As for me, it was not possible even under deep hypnotic instruction to pass myself off to a slug in possession of my mind as a candidate for renegade. So the psycho lads decided—and to which I said "Amen!"; it saved me from telling the Old Man that I would not volunteer to let myself be caught by a slug and it saved him from rigging some damned logical necessity which would force me into "volunteering".

It may seem illogical that titans would "free" a host even though they knew that the host was the sort who could be owned. But the advantages to them show up through analogy: the commissars will not willingly let any of their slave-citizens escape; nevertheless they send out thousands of fifth columnists into the territory of free men. Once outside, these agents can choose freedom and many do, but most of them don't—as we all know too well. They prefer slavery.

In the renegades the slugs had a supply of "trustworthy" fifth columnists—"trustworthy" is not the right word but the English language has no word for this form of vileness. That Zone Green was being penetrated by renegades was certain—but it is hard to tell a fifth columnist from a custard head; it always has been. The ratio of damn fools to villains is high.

So I got ready to go. I took under light hypnosis a refresher in the languages I would need with emphasis on shibboleth phrases of the latest meanderings of the Party Line. I was provided with a personality and coached in a trade which would permit me to travel, repairman for irrigating pumps—and given much money. If it suited me, my trade would let me hint that a pump had been sabotaged. Coercion, intimidation, blackmail, and bribery are especially useful behind the Curtain; the people have lived under a terror so long that they have no defenses; their puppet strings are always at hand.

I was to be dropped, rather than let to crawl under the Curtain. If I failed to report back, other agents would follow. Probably other agents would anyhow—or already had gone. I was not told; what an agent does not know he cannot divulge, even under drugs.

The reporting equipment was a new model and a joy to have. Ultramicrowave stuff with the directional cavity no bigger than a teacup and the rest, power pack and all, hardly larger than a loaf of bread, with the whole thing so well shielded that it would not make a Geiger counter even nervous. Strictly horizon range—I was to aim it at whatever space station was above the horizon. It had to be aimed closely, which required me to seal into my mind the orbital tables of all three space stations and a navigational grid of the territory I was to operate in. The handicap was really its prime advantage; the highly directional quality of the sender meant that it would not be detected save by wild accident.

I had to drop through their screen but it would be under a blanket of anti-radar "window" to give their search technicians fits. They would know that something was being dropped, but they would not know what, nor where, nor when, for mine would not be the only blanket, nor the only night of such tactics.

Once I had made up my mind whether the USSR was or was not slug infested I was to dictate a report to whatever space station was in sight—the line-of-sight, that is; I can't pick out a space station by eye and I doubt those who say they can. Report made, I was free to walk, ride, crawl, sneak and/or bribe my way out if I could.

The only trouble was that I never had a chance to use these preparations; the Pass Christian saucer landed.

The Pass Christian saucer was only the third to be seen after landing. Of the first two, the Grinnell saucer had been concealed by the slugs—or perhaps it took off again—and the Burlingame saucer was a radioactive memory. But the Pass Christian saucer was tracked and was seen on the ground almost at once.

It was tracked by Space Station Alpha—and recorded as an extremely large meteorite believed to have landed in or near the Gulf of Mexico. Which fact was not connected with the Pass Christian saucer until later but which, when it was, told us why we had failed to spot other landings by radar screen . . . the saucers came in too fast.

The saucers could be "seen" by radar—the primitive radar of sixty-odd years ago had picked them up many times, especially when cruising at atmospheric speeds while scouting this planet. But our modern radar had been "improved" to the point where saucers could not be seen; our instruments were too specialized. Electronic instruments follow an almost organic growth toward greater and greater selectivity. All our radar involves discriminator circuits and like gimmicks to enable each type to "see" what it is supposed to see and not bother with what it should ignore. Traffic block control sees atmospheric traffic only; the defense screen and fire control radars see what *they* are supposed to see—the fine screen "sees" a range from atmospheric speeds up to orbiting missiles at five miles a second; the coarse screen overlaps the fine screen, starting down at the lowest wingless-missile speed and carrying on up into the highest spaceship speeds relative to Earth and somewhat higher—about ten miles per second.

There are other selectivities—weather radar, harbor radar, and so forth. The point is *none* of them sees objects at speeds over ten miles per second . . . with the single exception of meteor-count radars in the space stations, which are not military but a research concession granted by the U.N. to the Association for the Advancement of Science.

Consequently the "giant meteor" was recorded as such and was not associated with flying saucers until later.

But the Pass Christian saucer was seen to land. The submersible cruiser U.N.S. *Robert Fulton* on routine patrol of Zone Red out of Mobile was ten miles off Gulfport with only her receptors showing when the saucer decelerated and landed. The spaceship popped up on the screens of the cruiser as it dropped from outer-space speed (around fifty-three miles per second by the space station record) to a speed the cruiser's radars would accept.

It came out of nothing, slowed to zero, and disappeared from the screen—but the operator had a fix on the last blip, less than twenty miles away on the Mississippi coast. The cruiser's skipper was puzzled. The radar track surely could not be a ship, since ships don't decelerate at fifty gravities. It did not occur to him that g's might not matter to a slug. He swung his ship over and took a look.

His first dispatch read: SPACESHIP LANDED BEACH WEST OF PASS CHRISTIAN MISSISSIPPI. His second was: LANDING FORCE BEACHING TO CAPTURE.

If I had not been in the Section offices I suppose I would have been left out of the party. As it was my phone shrilled so, that I bumped my head on the study machine I was using and swore. The Old Man said, "Come at once. Move!"

It was the same party we had started with so many weeks—or was it years?—before, the Old Man, Mary, and myself. We were in the air and heading south at emergency maximum, paying no attention to block controls and with our transponder sending out the police warning, before the Old Man told us why.

When he did tell us, I said, "Why the family group? You need a full-scale air task force."

"It will be there," he answered grimly. Then he grinned, his old wicked grin, an expression I had not seen since it started. "What do you care?" he jibed. "The 'Cavanaughs' are riding again. Eh, Mary?"

I snorted. "If you want that sister-and-brother routine, you had better get another boy."

"Just the part where you protect her from dogs and strange men," he answered soberly. "And I do mean dogs and I do mean strange men, very strange men. This may be the payoff, son."

I started to ask him more but he went into the operator's compartment, closed the panel, and got busy at the communicator. I turned to Mary. She snuggled up with a little sigh and said, "Howdy, Bud."

I grabbed her. "Don't give me that 'Bud' stuff or somebody's going to get a paddling."

XXVII

We were almost shot down by our own boys, then we picked up an escort of two Black Angels who throttled back and managed to stay with us. They turned us over to the command ship from which Air Marshal Rexton was watching the action. The command ship matched speeds with us and took us inboard with an anchor loop—I had never had that done before; it's disconcerting.

Rexton wanted to spank us and send us home, since we were technically civilians—but spanking the Old Man is a chore. They finally unloaded us and I squatted our car down on the seawall roadway which borders the Gulf along there—scared out of my wits, I should add, for we were buffeted by A.A. on the way down. There was fighting going on above and all around us, but there was a curious calm near the saucer itself.

The outlander ship loomed up almost over us, not fifty yards away.

It was as convincing and as ominous as the plastic-board fake in Iowa had been phony. It was a discus in shape and of great size; it was tilled slightly toward us, for it had grounded partly on one of the magnificent high-stilted old mansions which line that coast. The house had collapsed but the saucer was partly supported by the wreckage and by the six-foot-thick trunk of a tree that had shaded the house.

The ship's canted attitude let us see that the upper surface and what was surely its airlock—a metal hemisphere, a dozen feet across, at the main axis of the ship, where the hub would have been had it been a wheel. This hemisphere was lifted straight out or up from the body of the ship some six or eight feet. I could not see what held it out from the hull but I assumed that there must be a central shaft or piston; it came out like a poppet valve.

It was easy to see why the masters of the saucer had not closed up again and taken off from there; the airlock was fouled, held open by a "mud turtle", one of those little amphibious tanks which are at home on the bottom of a harbor or crawling up onto a beach—part of the landing force of the *Fulton.*

Let me set down now what I learned later; the tank was commanded by Ensign Gilbert Calhoun of Knoxville; with him was Powerman 2/c Florence Berzowski and a gunner named Booker T. W. Johnson. They were all dead, of course, before we got there.

The car, as soon as I roaded it, was surrounded by a landing force squad commanded by a pink-cheeked lad who seemed anxious to shoot somebody or anybody. He was less anxious when he got a look at Mary but he still refused to let us approach the saucer until he had checked with his tactical commander—who in turn consulted the skipper of the *Fulton.* We got an answer back in a short time, considering that the demand must have been referred to Rexton and probably clear back to Washington.

While waiting I watched the battle and, from what I saw, was well pleased to have no part of it. Somebody was going to get hurt—a good many had already. There was a male body, stark naked, just behind the car—a boy not more than fourteen. He was still clutching a rocket launcher and across his shoulders was the mark of the beast, though the slug was nowhere around. I wondered whether the slug had crawled away and was dying, or whether, perhaps, it had managed to transfer to the person who had bayoneted the boy.

Mary had walked west on the highway with the downy young naval officer while I was examining the corpse. The notion of a slug, possibly still alive, being around caused me to hurry to her. "Get back into the car," I said.

She continued to look west along the road. "I thought I might get in a shot or two," she answered, her eyes bright.

"She's safe here," the youngster assured me. "We're holding them, well down the road."

I ignored him. "Listen, you bloodthirsty little hellion," I snapped, "get back in that car before I break every bone in your body!"

"Yes, Sam." She turned and did so.

I looked back at the young salt. "What are you staring at?" I demanded, feeling edgy and needing someone to take it out on. The place smelled of slugs and the wait was making me nervous.

"Nothing much," he said, looking me over. "In my part of the country we don't speak to ladies that way."

"Then why in the hell don't you go back where you come from?" I answered and stalked away. The Old Man was missing, too; I did not like it.

An ambulance, coming back from the west, ground to a halt beside me. "Has the road to Pascagoula been opened?" the driver called out.

The Pascagoula River, thirty miles or so east of where the saucer had landed, was roughly "Zone Amber" for that area; the town of that name was east of the river's mouth and, nominally at least, in Zone Green—while sixty or seventy miles west of us on the same road was New Orleans, the heaviest concentration of titans south of St. Louis. Our opposition came from New Orleans while our nearest base was in Mobile.

"I haven't heard," I told the driver.

He chewed a knuckle. "Well . . . I made it through once; maybe I'll make it back all right." His turbines whined and he was away. I continued to look for the Old Man.

Although the ground fighting had moved away from the site, the air fighting was all around and above us. I was watching the vapor trails and trying to figure out who was what and how they could tell, when a big transport streaked into the area, put on the brakes with a burst of rato units, and spilled a platoon of sky boys. Again I wondered; it was too far away to tell whether they wore slugs or not. At least it came in from the east, but that did not necessarily prove anything.

I spotted the Old Man, talking with the commander of the landing force. I went up and interrupted. "We ought to get out of here, boss. This place is due to be atom-bombed about ten minutes ago."

The commander answered me. "Relax," he said blandly, "the concentration does not merit Abombing, not even a pony bomb."

I was just about to ask him sharply how he knew that the slugs would figure it that way, when the Old Man interrupted. "He's right, son." He took me by the arm and walked me back toward the car. "He's perfectly right, but for the wrong reasons."

"Huh?"

"Why haven't *we* bombed the cities *they* hold? They won't bomb this area, not while that ship is intact. They don't want to damage it; they want it back. Now go on back to Mary. Dogs and strange men—remember?"

I shut up, unconvinced. I expected us all to be clicks in a Geiger counter any second. Slugs, fighting as individuals, fought with gamecock recklessness—perhaps because they were really not individuals. Why should they be any more cautious about one of their own ships? They might be more anxious to keep it out of our hands than to save it.

We had just reached the car and spoken to Mary when the still-damp little snottie came trotting up. He halted, caught his breath, and saluted the Old Man. "The commander says that you are to have anything you want, sir—anything at all!"

From his manner I gathered that the answering dispatch had probably been spelled out in asterisks, accompanied by ruffles and flourishes. "Thank you, sir," the Old Man said mildly. "We merely want to inspect the captured ship."

"Yes, sir. Come with me, sir." He came with us instead, having difficulty making up his mind whether to escort the Old Man or Mary. Mary won. I came along behind, keeping my mind on watching out and ignoring the presence of the youngster. The country on that coast, unless gardened constantly, is practically jungle; the saucer lapped over into a brake of that sort and the Old Man took a shortcut through it. The kid said to him. "Watch out, sir. Mind where you step."

I said, "Slugs?"

He shook his head. "Coral snakes."

At that point a poisonous snake would have seemed as pleasant as a honey bee, but I must have been paying some attention to his warning for I was looking down when the next thing happened.

I first heard a shout. Then so help me, a Bengal tiger was charging us.

Probably Mary got in the first shot. I know that mine was not behind that of the young officer; it might even have been ahead. I'm sure it was—fairly sure, anyhow. It was the Old Man who shot last.

Among the four of us we cut that beast so many ways that it would never be worth anything as a rug. And yet the slug on it was untouched; I fried it with my second bolt. The young fellow looked at it without surprise. "Well," he said, "I thought we had cleaned up that load."

"Huh? What do you mean?"

"One of the first transport tanks they sent out. Regular Noah's Ark. We were shooting everything from gorillas to polar bears. Say, did you ever have a water buffalo come at you?"

"No and I don't want to."

"Not near as bad as the dogs, really. If you ask me, those things don't have much sense." He looked at the slug, quite unmoved, while I was ready as usual to throw up.

We got up out of there fast and onto the titan ship—which did not make me less nervous, but more. Not that there was anything frightening in the ship itself, not in its appearance.

But its appearance wasn't *right*. While it was obviously artificial, one knew without being told that it was not made by men. Why? I don't know. The surface of it was dull mirror, not a mark on it—not any sort of a mark; there was no way to tell how it had been put together. It was as smooth as a Jo block.

I could not tell of what it was made. Metal? Of course, it *had* to be metal. But was it? You would expect it to be either bitterly cold—or possibly intensely hot from its landing. I touched it and it was not anything at all, neither cold nor hot. Don't tell me it just happened to be exactly ninety-eight and six-tenths. I noticed another thing presently; a ship that size, landing at high speed, should have blasted a couple of acres. There was no blast area at all; the brake around it was green and rank.

We went up to the parasol business, the air lock, if that is what it was. The edge was jammed down tight on the little mud turtle; the armor of the tank was crushed in, as one might crush a pasteboard box with the hand. Those mud turtles are built to launch five hundred feet deep in water; they are *strong*.

Well, I suppose this one was strong. The parasol arrangement had damaged it, but the air lock had not closed. On the other hand the metal, or whatever the spaceship's door was made of, was unmarked by the exchange.

The Old Man turned to me. "Wait here with Mary."

"You're not going in there by yourself?"

"Yes. There may be very little time."

The kid spoke up. "I'm to stay with you, sir. That's what the commander said."

"Very well, sir," the Old Man agreed. "Come along." He peered over the edge, then knelt and lowered himself by his hands. The kid followed him. I felt burned up—but had no desire to argue the arrangements.

They disappeared into the hole. Mary turned to me and said, "Sam—I don't like this. I'm afraid."

She startled me. I was afraid myself—but I had not expected her to be. "I'll take care of you."

"Do we have to stay? He did not say so, quite."

I considered it. "If you want to go back to the car I'll take you back."

"Well . . . no, Sam, I guess we have to stay. Come closer to me." She was trembling.

I don't know how long it was before they stuck their heads over the rim. The youngster climbed out and the Old Man told him to stand guard. "Come on," he said to us, "it's safe—I think."

"The hell it is," I told him, but I went because Mary was already starting. The Old Man helped her down.

"Mind your head," he said. "Low bridge all the way."

It is a platitude that unhuman races produce unhuman works, but very few humans have ever been inside a Venerian labyrinth and still fewer have seen the Martian ruins—and I was not one of the few. I don't know what I expected. Superficially the inside of the saucer was not, I suppose, too startling, but it was strange. It had been thought out by unhuman brains, ones which did not depend on human ideas in fabricating, brains which had never heard of the right angle and the straight line or which regarded them as unnecessary or undesirable. We found ourselves in a very small oblate chamber and from there we crawled through a tube about four feet thick, a tube which seemed to wind down into the ship and which glowed from all its surface with a reddish light.

The tube held an odd and somewhat distressing odor, as if of marsh gas, and mixed with it faintly was the reek of dead slugs. That and the reddish glow and the total lack of heat response from the wall of the tube as my palms pressed against it gave me the unpleasant fancy that I was crawling through the gut of some unearthly behemoth rather than exploring a strange machine.

The tube branched like an artery and there we came across our first Titanian androgyne. He—let me call it "he"—was sprawled on his back, like a child sleeping, his head pillowed on his slug. There was a suggestion of a smile on the little rosebud mouth; at first I did not realize that he was dead.

At first sight the similarities between the Titanian people and ourselves are more noticeable than the differences; we impress what we expect to see on what we do see, as a wind-sculptured rock may look like a human head or a dancing bear. Take the pretty little "mouth" for example; how was I to know that it was an organ for breathing solely?

Conceded that they are not human and that, despite the casual similarities of four limbs and a head-like protuberance, we are less like them than is a bullfrog like a bullpup; nevertheless the general effect is pleasing, not frightening, and faintly human. "Elfin" I should say—the elves of Saturn's moons. Had we met them before the slugs we call titans possessed them I think we could have gotten along with them. Judged by their ability to build the saucers they were our equals—if they did build them. (Certainly the slugs did not build them; slugs are not builders but thieves, cosmic cuckoos.)

But I am letting my own later thoughts get in the way. When I saw the little fellow I managed to draw my gun. The Old Man, anticipating my reaction, turned and said, "Take it easy. It's dead—they are all dead, smothered in oxygen when the tank ruined their air seal."

I still had my gun out. "I want to burn the slug," I insisted. "It may still be alive." It was not covered by the horny shell we had lately come to expect but was naked, moist and ugly.

He shrugged. "Suit yourself. It can't possibly hurt you."

"Why not?"

"Wrong chemistry. That slug can't live on an oxygen breather." He crawled across the little body, giving me no chance to shoot had I decided to. Mary, always so quick with a gun, had not drawn but had shrunk against my side and was breathing in sharp little sobbing gasps. The Old Man stopped and said patiently, "Coming, Mary?"

She choked and then gasped, "Let's go back! Let's get out of here!"

I said, "She's right. This is no job for three people; this is something for a research team and proper equipment."

He paid no attention to me. "It has to be done, Mary. You know that. And you have to be the one to do it."

"Why does she have to do it?" I demanded angrily.

Again he ignored me. "Well, Mary?"

From somewhere inside herself she called on reserves. Her breathing became normal, her features relaxed, and she crawled across the slug-ridden elfin body with the serenity of a queen going to the gallows. I lumbered after them, still hampered by my gun and trying not to touch the body.

We came at last to a large chamber. It may have been the control room, for there were many of the dead little elfin creatures in it, though I saw nothing resembling (to my eye) instruments or machinery. Its inner surface was cavitated and picked out with lights much brighter than the reddish illumination and the chamber space was festooned with processes as meaningless to me as the convolutions of a brain. I was troubled again with the thought—completely wrong, I know now—that the ship itself was a living organism.

The Old Man paid no attention but crawled on through and into another ruddy-glowing tube. We followed its contortions to a place where it widened out to ten feet or more with a "ceiling" overhead almost tall enough to let us stand erect. But that was not what caught our eyes; the walls were no longer opaque.

On each side of us, beyond transparent membranes, were thousands on thousands of slugs, swimming, floating, writhing in some fluid which sustained them. Each tank had an inner diffuse light of its own and I could see back into the palpitating mass—and I wanted to scream.

I still had my gun out. The Old Man reached back and placed his hand over the bell of it. "Don't yield to temptation," he warned me. "You don't want to let *that* loose in *here*. Those are for *us*."

Mary looked at them with a face too calm. Thinking back, I doubt that she was fully conscious in the ordinary sense. I looked at her, glanced back at the walls of that ghoulish aquarium, and said urgently, "Let's get out of here if we can—then just bomb it out of existence."

"No," he said quietly, "there is more. Come." The tube narrowed in again, then enlarged and we were again in a somewhat smaller chamber like that of the slugs. Again there were transparent walls and again there were things floating beyond them.

I had to look twice before I could fully make out and believe what I saw.

Floating just beyond the wall, face down, was the body of a man—a human, Earthborn man—about forty to fifty years old. He was grizzled and almost bald. His arms were curved across his chest and his knees were drawn up, as if he were sleeping safe in bed—or in the womb.

I watched him, thinking terrible thoughts. He was not alone; there were more beyond him, male and female, young and old—but he was the only one I could see properly and he got my attention. I was sure that he was dead; it did not occur to me to think otherwise—then I saw his mouth working—and then I wished he were dead.

Mary was wandering around in that chamber as if she were drunk—no, not drunk but preoccupied and dazed. She went from one transparent wall to the other, peering intently into the crowded, half-seen depths. The Old Man looked only at her. "Well, Mary?" he said softly.

"I can't find them!" she said piteously in a voice like a little girl's. She ran back to the other side.

The Old Man grasped her arm and stopped her. "You're not looking for them in the right place," he said firmly. "Go back where they are. Remember?"

She stopped and her voice was a wail. "*I can't remember*!"

"You must remember . . . now. This is what you can do for them. You must return to where they are and look for them."

Her eyes closed and tears started leaking from them. She gasped and choked. I pushed myself between them and said, "Stop this! What are you doing to her?"

He grabbed me with his free hand and pushed me away. "No, son," he whispered fiercely. "Keep out of this—you *must* keep out."

"But—"

"No!" He let go of Mary and led me away to the entrance. "Stay there. And, as you love your wife, as you hate the titans, do not interfere. I shan't hurt her—that's a promise."

"What are you going to do?" But he had turned away. I stayed, unwilling to let it go on, afraid to tamper with what I did not understand.

Mary had sunk down to the floor and now squatted on it like a child, her face covered with her hands. The Old Man went back to her, knelt down and touched her arm. "Go back," I heard him say. "Go back to where it started."

I could barely hear her answer, "No . . . no."

"How old were you? You seemed to be about seven or eight when you were found. It was before that?"

"Yes—yes, it was before that." She sobbed and collapsed completely to the floor. "Mama! Mama!"

"What is your mama saying?" he asked gently.

"She doesn't say anything. She's looking at me so queerly. There's something on her back. I'm afraid, I'm afraid!"

I got up and hurried toward them, crouching to keep from hitting the low ceiling. Without taking his eyes off Mary the Old Man motioned me back. I stopped, hesitated. "Go back," he ordered. "Way back."

The words were directed at me and I obeyed them—but so did Mary. "There was a ship," she muttered, "a big shiny ship—" He said something to her; if she answered I could not hear it. I stayed back this time and made no attempt to interfere. I could see that he was doing her no physical hurt and, despite my vastly disturbed emotions, I realized that something important was going on, something big enough to absorb the Old Man's full attention in the very teeth of the enemy.

He continued to talk to her, soothingly but insistently. Mary quieted down, seemed to sink almost into a lethargy, but I could hear that she answered him. After a while she was talking in the monotonous logorrhea of emotional release. Only occasionally did the Old Man prompt her.

I heard something crawling along the passage behind me. I turned and drew my gun, with a wild feeling that we were trapped. I almost shot him before I realized that it was the ubiquitous young officer we had left outside. "Come on out!" he said urgently. He pushed on past me out into the chamber and repeated the demand to the Old Man.

The Old Man looked exasperated beyond endurance. "Shut up and don't bother me," he said.

"You've *got* to, sir," the youngster insisted. "The commander says that you must come out at once. We're falling back; the commander says he may have to use demolition at any moment. If we are still inside—*blooie*! That's it."

"Very well," the Old Man agreed in unhurried tones. "We're coming. You go out and tell your commander that he must hold off until we get out; I have vitally important information. Son, help me with Mary."

"Aye, aye, sir!" the youngster acknowledged. "But hurry!" He scrambled away. I picked up Mary and carried her to where the chamber narrowed into a tube; she seemed almost unconscious. I put her down.

"We'll have to drag her," the Old Man said. "She may not come out of this soon. Here—let me get her up on your back, you can crawl with her."

I paid no attention but shook her. "Mary," I shouted, "Mary! Can you hear me?"

Her eyes opened. "Yes, Sam?"

"Darling—we've got to get out of here, *fast*! Can you crawl?"

"Yes, Sam." She closed her eyes again. I shook her again. "Mary!"

"Yes, darling? What is it? I'm so tired."

"Listen, Mary—you've got to crawl out of here. If you don't the slugs will get us—do you understand?"

"All right, darling." Her eyes stayed open this time but were vacant. I got her headed up the tube and came along after her. Whenever she faltered or slowed I slapped at her. I lifted and dragged her through the chamber of the slugs and again through the control room, if that is what it was. When we came to the place where the tube was partly blocked by the dead elfin creature she stopped; I wormed my way past her and moved it, stuffing it into the branching tube. There was no doubt, this time, that its slug was dead; I gagged at the job. Again I had to slap her into cooperation.

After an endless nightmare of leaden-limbed striving we reached the outer door and the young officer was there to help us lift her out, him pulling and the Old Man and me lifting and pushing. I gave the Old Man a leg up, jumped out myself, and took her away from the youngster. It was quite dark.

We went back the long way past the crushed house, avoiding the jungle like brake, and thence down to the beach road. Our car was no longer there; it did not matter for we found ourselves hurried into a "mud turtle" tank—none too soon, for the fighting was almost on top of us. The tank commander buttoned up and the craft lumbered off the stepped-back seawall and into the water. Fifteen minutes later we were inside the *Fulton*.

And an hour later we disembarked at the Mobile base. The Old Man and I had bad coffee and sandwiches in the wardroom of the *Fulton*, some of the Wave officers had taken Mary and cared for her in the women's quarters. She joined us as we left and seemed entirely normal. I said, "Mary, are you all right?"

She smiled at me. "Of course, darling. Why shouldn't I be?"

A small command ship and an escort took us out of there. I had supposed that we were headed back to the Section offices, or more likely to Washington. I had not asked; the Old Man was in no mood to talk and I was satisfied simply to hold Mary's hand and feel relieved.

The pilot put us into a mountainside hangar in one of those egg-on-a-plate maneuvers that no civilian craft can accomplish—in the sky at high speed, then in a cave and stationary. Like that. "Where are we?" I asked.

The Old Man did not answer but got out; Mary and I followed. The hangar was small, just parking space for about a dozen craft, an arresting platform, and a single launching rack; it contained only two other ships besides ours. Guards met us and directed us on back to a door set in the living rock; we went through and found ourselves in an anteroom. An unseen metallic voice told us to strip off what little we wore. I did not mind being naked but I hated to part with my gun and phone.

We went on inside and were met by a young fellow whose total clothing was an armband showing three chevrons and crossed retorts. He turned us over to a girl who was wearing even less, as her armband had only two chevrons. Both of them noticed Mary, each with typical gender response. I think the corporal was glad to pass us on to the captain who received us.

"We got your message," the captain said. "Dr. Steelton is waiting."

"Thank you, ma'am," the Old Man answered. "The sooner, the better. Where?"

"Just a moment," she said, went to Mary and felt through her hair. "We have to be sure, you know," she said apologetically. If she was aware of the falseness of much of Mary's hair, she did not mention it and Mary did not flinch. "All right," she decided, "let's go." Her own hair was cut mannishly short, in crisp gray waves.

"Right," agreed the Old Man. "No, son, this is as far as you go."

"Why?" I asked.

"Because you dam near loused up the first try," he explained briefly. "Now pipe down."

The captain said, "The officers' mess is straight down the first passageway to the left. Why don't you wait there?"

So I did. On the way I passed a door decorated primly in large red skull-and-crossbones and stenciled with: WARNING—LIVE PARASITES BEYOND THIS DOOR; in smaller letters it added *Qualified Personnel Only—Use Procedure "A"*.

I gave the door a wide berth.

The officers' mess was the usual clubroom and there were three or four men and two women lounging in it. No one seemed interested in my presence, so I found an unoccupied chair, sat down, and wondered just who you had to be to get a drink around this joint. After a time I was joined by a large male extrovert wearing a colonel's insignia on a chain around his neck; with it was a Saint Christopher's medal and an I.D. dog tag. "Newcomer?" he asked.

I admitted it. "Civilian expert?" he went on.

"I don't know about 'expert'," I replied. "I'm a field operative."

"Name? Sorry to be officious," he apologized, "but I'm alleged to be the security officer around here. My name's Kelly."

I told him mine. He nodded. "Matter of fact I saw your party coming in. Mine was the voice of conscience, coming out of the wall. Now, Mr. Nivens, how about a drink? From the brief we had on you, you could use one."

I stood up. "Whom do I have to kill to get it?"

"—though as far as I can see," Kelly went on sometime later, "this place needs a security officer the way a horse needs roller skates. We should publish our results as fast as we get them. This isn't like fighting a human enemy."

I commented that he did not sound like the ordinary brass hat. He laughed and did not take offense. "Believe me, son, not all brass hats are as they are pictured—they just seem to be."

I remarked that Air Marshal Rexton struck me as a pretty sharp citizen.

"You know him?" the colonel asked.

"I don't know him exactly, but my work on this job has thrown me in his company a good bit—I last saw him earlier today."

"Hmm—" said the colonel. "I've never met the gentleman. You move in more rarefied strata than I do, sir."

I explained that it was mere happenstance, but from then on he showed me more respect. Presently he was telling me about the work the laboratory did. "By now we know more about those foul creatures than does Old Nick himself. But do we know how to kill them without killing their hosts? We do not.

"Of course," he went on, "if we could lure them one at a time into a small room and douse them with anesthetics, we could save the hosts—but that is like the old saw about how to catch a bird: naturally it's no trouble if you can sneak up close enough to put salt on its tail. I'm not a scientist myself—just the son of a cop and a cop myself under a different tag—but I've talked to the scientists here and I know what we need. This is a biological war and it will be won by biological warfare. What we need is a bug, one that will bite the slug and not the host. Doesn't sound too hard, does it? It is. We know a hundred things that will kill the slug—smallpox, typhus, syphilis, encephalitis lethargica, Obermeyer's virus, plague, yellow fever, and so on. But they kill the host, too."

"Couldn't they use something that everyone is immune to?" I asked. "Take typhoid—everybody has typhoid shots. And almost everybody is vaccinated for smallpox."

"No good—if the host is immune, the parasite doesn't get exposed to it. Now that the slugs have developed this outer cuticle the parasite's environment is the host. No, we need something the host will catch and that will kill the slug, but won't give the host more than a mild fever or a splitting headache."

I started to answer with some no-doubt brilliant thought when I saw the Old Man standing in the doorway. I excused myself and went to him. "What was Kelly grilling you about?" he asked.

"He wasn't grilling me," I answered.

"That's what you think. Don't you know what Kelly that is?"

"Should I?"

"You should. Or perhaps you shouldn't; he never lets his picture be taken. That's B. J. Kelly, the greatest scientific criminologist of our generation."

"*That* Kelly! But he's not in the army."

"Reserve, probably. But you can guess how important this laboratory is. Come on."

"Where's Mary?"

"You can't see her now. She's recuperating."

"Is she—hurt?"

"I promised you she would not be hurt. Steelton is the best in his line. But we had to go down deep, against a great deal of resistance. That's always rough on the subject."

I thought about it. "Did you get what you were after?"

"Yes and no. We got a great deal, but we aren't through."

"What were you after?"

We had been walking along one of the endless underground passageways of which the place was made. Now he turned us into a small, empty office and we sat down. The Old Man touched the communicator on the desk and said, "Private conference."

"Yes, sir," a voice answered. "We will not record." A green light came on in the ceiling.

"Not that I believe them," the Old Man complained, "but it may keep anyone but Kelly from playing it back. Now, son, about what you want to know; I'm not sure you are entitled to it. You are married to the girl, but that does not mean that you own her soul—and this stuff comes from down so deep that she did not know she had it herself."

I said nothing; there was nothing to say. He went on presently in worried tones, "Still—it might be better to tell you enough so that you will understand. Otherwise you would be bothering her to find out. That I don't want to happen, I don't ever want that to happen. You might throw her into a bad wingding. I doubt if she'll remember anything herself—Steelton is a very gentle operator—but you could stir up things."

I took a deep breath. "You'll have to judge. I can't."

"Yes, I suppose so. Well, I'll tell you a bit and answer your questions—some of them—in exchange for a solemn promise never to bother your wife with it. You don't have the skill."

"Very well, sir. I promise."

"Well—there was a group of people, a cult you might call them, that got into disrepute."

"I know—the Whitmanites."

"Eh? How did you know? From Mary? No, she couldn't have; she didn't know herself."

"No, not from Mary. I just figured it out."

He looked at me with odd respect. "Maybe I've been underestimating you, son. As you say, the Whitmanites. Mary was one of them, as a kid in Antarctica."

"Wait a minute!" I said. "They left Antarctica in—" The wheels buzzed in my mind and the number came up. "—in 1974."

"Surely. What about it?"

"But that would make Mary around forty years old. She can't be."

"Do you care?"

"Huh? Why, no—but she can't be."

"She is and she isn't. Just listen. Chronologically her age is about forty. Biologically she is in her middle twenties. Subjectively she is even younger, because she doesn't remember anything, not to know it, earlier than about 1990."

"What do you mean? That she doesn't remember I can understand—she never *wants* to remember. But what do you mean by the rest?"

"Just what I said. She is no older than she is because—you know that room where she started to remember? She spent ten years and probably more floating in suspended animation in just such a tank as that."

XXVIII

Time was when I was immune to emotional shocks. But as I get older, I don't get tougher; I get softer. Being in love has a lot to do with it, too. The thought of Mary, my beloved Mary, swimming in that artificial womb, neither dead nor alive but preserved like a pickled grasshopper, was too much for me.

I heard the Old Man saying, "Take it easy, son. She's all right."

I said, "Go ahead."

Mary's overt history was simple, although mystifying. She had been found in the swamps near Kaiserville at the North Pole of Venus—a little girl who could give no account of herself and who knew only her name—Allucquere. Nobody spotted the significance of the name and a child of her (apparent) age could not be associated with the Whitmanites debacle in any case; the 1980 supply ship had not been able to find any survivor of their "New Zion" colony. Its plantations had returned to the swamp; the dwellings were ruptured shells, hidden in rank growth. More than ten years of time and more than two hundred miles of jungle separated the little waif of Kaiserville from the Godstruck colonists of New Zion.

At that time, an unaccounted-for Earth child on Venus was little short of incredible. Like finding the cat locked in the icebox, it called for explanation. But there was no one around with the intellectual curiosity to push the matter. Kaiserville still does not have a sweet reputation; in those days it was made up of miners, doxies, company representatives of the Two Planets Corporation—and nothing else. I don't suppose that shoveling radioactive mud in the swamps leaves much energy for wonder.

Apparently she grew up using poker chips for toys and calling every woman in crib row "mother" or "auntie". In turn they shortened her name to "Lucky". The Old Man did not go into detail about who paid her way back to Earth and why, and he avoided my questions. The real question was where she had been from the time New Zion was eaten up by the Venerian jungle and just what had happened to the colony.

The only record of those things was buried in Mary's mind, locked tight with terror and despair.

Sometime before 1980—about the same time as the flying saucer reports from Russo-Siberia, or a year or so earlier—the titans had discovered the New Zion colony. If you place it one Saturn year earlier than the invasion of Earth, the times fit fairly well. It does not seem likely that the titans were looking for Earthmen on Venus; more probably they were scouting Venus as they had long scouted Earth. Or they may have known just where to look; we know that they kidnapped Earthmen at intervals over the course of two or more centuries; they may have captured someone on Earth whose brain could tell them where to find the New Zion colony. Mary's dark memories could contain no clue to that.

Mary saw the colony captured, saw her parents turned into zombies who no longer cared for her. Apparently she herself was not possessed, or she may have been possessed and turned loose, the titans finding a weak and ignorant young girl an unsuitable slave. In any case, for what was to her baby mind an endlessly long time, she hung around the slave colony, unwanted, uncared for, but unmolested, scavenging like a mouse for her living. On Venus the slugs were moving in to stay; their principal slaves were Venerians and the New Zion colonists were only incidental. It is sure that Mary saw her parents being placed in suspended animation—for later use in the invasion of Earth? Probable, but not certain.

In due course she herself was grabbed and placed in the tanks. Inside a titan ship? At a titan base on Venus itself? More probably the latter, as when she awoke, she was still on Venus. There are many such gaps. Were the slugs that rode the Venerians identical with the slugs which rode the colonists? Possible—since both Earth and Venus have oxy-carbon economy. The slugs seem to be endlessly protean but they surely have to adapt themselves to the biochemistry of their hosts. Had Venus an oxy-silicon economy like Mars, or a fluorine economy, the same parasite type could not possibly have fed on both.

But the gist of the matter lay in the situation as it was when Mary was removed from the artificial incubator. The titan invasion of Venus had failed, or was failing. Almost certainly she was possessed as soon as they removed her from the tank—but Mary had outlived the slug that possessed her.

Why had the slugs died? Why had the invasion of Venus failed? It was for clues to these that the Old Man and Dr. Steelton had gone fishing in Mary's brain.

I said, "Is that all?"

He answered, "Isn't that enough?"

"It raises as many questions as it answers," I complained.

"Of course there is more," he told me, "a great deal more. But you aren't a Venerian expert of any sort, nor a psychologist, so you won't be called on to evaluate it. I've told you what I have so that you will know why we have to work on Mary and so that you won't question her about it. Be good to her, boy; she's had more than her share of grief."

I ignored the advice; I can get along or not get along with my own wife without help, thank you. "What I can't figure out," I answered, "is why you ever had Mary linked up with flying saucers in the first place? I can see now that you took her along on that first trip to Iowa on purpose. You were right, granted—but why? And don't give me any malarkey."

The Old Man himself looked puzzled. "Son, do you ever have hunches?"

"Lord, yes!"

"What is a 'hunch'?"

"Eh? It's a belief that something is so, or isn't so, without evidence. Or a premonition that something is going to happen—or a compulsion to do something."

"Sloppy definitions. I'd call a hunch the result of automatic reasoning below the conscious level on data you did not know you possessed."

"Sounds like the black cat in the coal cellar at midnight. You didn't have any data, not then. Don't tell me that your unconscious mind works on data you are going to get, next week. I won't believe it."

"Ah, but I did have data."

"Huh?"

"What's the last thing that happens to a candidate before he is certified as an agent in our section?"

"The personal interview with you."

"No, no!"

"Oh—the trance analysis." I had forgotten hypno-analysis for the simple reason that the subject never remembers it; he's off somewhere else, wherever it is you go when you're asleep. "You mean you had this data on Mary then. It wasn't a hunch at all."

"No again. I had some, a very little of it—Mary's defenses are strong. And I had forgotten what little I knew, in my conscious memory. But I knew that Mary was the agent for this job. Later on I played back her hypno interview; then I *knew* that there must be more. We tried for it—and did not get it. But I knew that there had to be more."

I thought it over. "You must have been pretty cocky certain that it was worth digging out; you sure put her over the bumps to get it."

"I had to. I'm sorry."

"Okay, okay." I waited a moment, then said, "Look—what was there in *my* hypno record?"

"That's not a proper question."

"Nuts."

"And I couldn't tell you if I would. I have never listened to your analysis, son."

"Huh?"

"I had my deputy play it, then asked him if there were anything in it which I should know. He said there wasn't so I never played it."

"So? Well—thanks."

He merely grunted, but I felt warmer toward him than I had in a long time. Dad and I have always managed to embarrass each other.

XXIX

The slugs had died from something they contracted on Venus. That much we knew, or thought we knew. We weren't likely to get another chance in a hurry to collect direct information as a dispatch came in while the Old Man and I were still talking, telling us that Rexton had finally ordered the Pass Christian saucer bombed to keep it from falling back in the hands of the titans. I think that the Old Man had hoped to get at those human beings whom we knew to be inanimate prisoners in that ship, find some way to breathe life into them, and question them.

Well, that chance was gone—what they could dig out of Mary had better be the answer. Assuming that some infection peculiar to Venus was fatal to slugs but not fatal to humans—at least Mary had lived through it—then the thing to do was to test them all and determine which one. Just dandy!—it was like examining every grain of sand on a wide beach to locate the one with square edges!

The problem was somewhat simplified by there being no need to check the Venus diseases known to be fatal to Earthmen. Perhaps it had been one of such, but, if so, no matter; we could as well use smallpox. But the list of diseases native to Venus which kill Earthmen is surprisingly short and the list of those which are not fatal but merely nastily annoying is very long—from the standpoint of a Venerian bug we must be too strange a diet to suit his taste. If a Venerian bug has a viewpoint, which I doubt, McIlvaine's silly ideas notwithstanding.

The problem was made harder by the fact that the types of diseases native to Venus which were represented by living cultures on Earth were strictly limited in number, i.e., the grain of sand we sought might not be on this beach. To be sure, such an omission could be repaired—in a century or so of exploration and research on a strange planet.

In the meantime there was beginning to be a breath of frost in the air; Schedule Sun Tan could not go on forever.

They had to go back where they hoped the answer was—into Mary's brain. I did not like it, but I could not stop it. She did not appear to know why she was being asked to submit, over and over again, to hypnotics—or perhaps she would not tell. She seemed serene, but the strain showed—circles under her eyes, things like that.

Finally I went to the Old Man and told him that it had to stop. "You know better than that, son," he said mildly.

"The hell I do! If you haven't gotten what you want from her by now, you'll never get it."

"Have you any idea of how long it takes to search *all* the memories in a person's mind, even if you limit yourself to a particular period? It takes exactly as long as the period itself. What we need—if it's there at all—may be subtle."

"If it's there at all,'" I repeated. "You don't know that it is. See here—if Mary miscarries as a result of this, I'll break your neck personally."

"And if we don't succeed," he answered gently, "you will wish to heaven that she had. Or do you want to raise up kids to be hosts to titans?"

I chewed my lip. "Why didn't you send me to the USSR as you planned to, instead of keeping me around?"

"Oh, that—In the first place I want you here, with Mary, keeping her morale up—instead of acting like a spoiled brat! In the second place, it isn't necessary, or I would have sent you."

"Huh? What happened? Did some other agent report in?"

He stood up and started to leave. "If you would ever learn to show a grownup interest in the news of the world, you would know."

I said, "Huh?" again, but he did not answer; he left.

I hurried out of there and brought myself up to date. My one-track mind has never been able to interest itself in the daily news; for my taste this dinning into the ears and eyes of trivia somewhere over the horizon is the bane of so-called civilization and the death of serious thinking. But I do miss things.

This time I had managed to miss the first news of the Asiatic plague. I had had my back turned on the biggest—no, the second biggest—news story of the century, the only continent-wide epidemic of the Black Death since the seventeenth century.

I could not understand it. Communists are crazy, granted—but I had been behind the Curtain enough to know that their public health measures were as good as ours and even better in some ways, for they were carried out "by the numbers" and no nonsense tolerated. And a country has to be, quite literally, lousy to permit the spread of plagues—rats, lice, and fleas, the historical vectors. In such respects the commissars had even managed to clean up China to the point, at least, that bubonic plague and typhus were sporadically endemic rather than epidemic.

Now both plagues were spreading like gossip across the whole Sino-Russo-Siberian axis, to the point where the soviet government system had broken down and pleas were being sent via the space stations for U.N. help. What had happened?

Out of my own mind I put the pieces together; I looked up the Old Man again. "Boss—there *were* slugs behind the Curtain."

"Yes."

"You knew? Well, for cripes sake—we'd better do something fast, or the whole Mississippi Valley will be in the shape that Asia is in. Just one rat, one little rat—" I was thinking back to my own time among the slugs, something I avoided doing when possible. The titans did not bother about human sanitation. My own master had not caused me to bathe, not once. I doubted if there had been a bath taken between the Canadian border and New Orleans since the slugs dropped the masquerade as unnecessary. Lice—Fleas—

The Old Man sighed. "Maybe that's the best solution. Maybe it's the only one."

"You might as well bomb them, if that's the best we have to offer. It would be a cleaner way to die."

"So it would. But you know that we won't. As long as there is a chance of cleaning out the vermin without burning down the barn, we'll keep on trying."

I mulled it over at great length. We were in still another race against time. Fundamentally the slugs must be too stupid to keep slaves; perhaps that was why they moved from planet to planet—they spoiled what they touched. After a while their hosts would die out and then they needed new hosts.

Theory, just theory—I brushed it aside. One thing was sure: what had happened behind the Curtain would happen in Zone Red unless we found a way to kill off the slugs, and that mighty soon! Thinking about it, I made up my mind to do something I had considered before—force myself into the mind-searching sessions being conducted on Mary. If there were something in her hidden memories which could be used to kill slugs, possibly I might see it where others had failed. In any case I was going in, whether Steelton and the Old Man liked it or not. I was tired of being treated like a cross between a prince consort and an unwelcome child.

XXX

Since our arrival Mary and I had been living in a cubicle about the size of a bass drum. It had been intended for one junior officer; the laboratory had not been planned for married couples. We were as crowded as a plate of smorgasbord but we did not care.

I woke up first the next morning and made my usual quick check to be sure that a slug had not gotten to her. While I was doing so, she opened her eyes and smiled drowsily. "Go back to sleep," I said. "You've got another thirty minutes."

But she did not go back to sleep. After a while I said, "Mary, do you know the incubation period for bubonic plague?"

She answered, "Should I know? One of your eyes is slightly darker than the other."

I shook her. "Pay attention, wench. I was in the lab library last night, doing some rough figuring. As I get it, the slugs must have moved in on our commie pals at least three months before they invaded us."

"Yes, of course."

"You knew? Why didn't you say so?"

"Nobody asked me. Besides, it's obvious."

"Oh, for heaven's sake! Let's get up; we'll be late for breakfast."

Before we left the cubicle I said, "Parlor games at the usual time this morning?"

"Yes."

"Mary, you never talk about what they ask you."

She looked surprised. "But I never know."

"That's what I gathered. Deep trance with a 'forgetter' order, eh?"

"I suppose so."

"Hmm . . . well, there will be some changes made. Today I am going in with you."

All she said was, "Yes, dear."

They were gathered as usual in Dr. Steelton's office, the Old Man, Steelton himself, a Colonel Gibsy who was chief of staff, a lieutenant colonel whom I knew only by sight, and an odd lot of sergeant-technicians, j.o.'s, and flunkies. In the army it seems to take an eight-man working party to help a brass hat blow his nose; that is one reason why I left the service.

The Old Man's eyebrows shot up when he saw me but he said nothing. A sergeant who seemed to be doorman tried to stop me. "Good morning, Mrs. Nivens," he said to Mary; then to me he added, "I don't seem to have you on the list."

"I'm putting myself on the list," I announced to the entire room and pushed on past him.

Colonel Gibsy glared at me and turned to the Old Man with one of those "Hrrumph-hrrumph-what's-all-this?" noises. The Old Man did not answer but his eyebrows went still higher. The rest looked frozen faced and tried to pretend they weren't there—except one WAC sergeant who could not keep from grinning.

The Old Man got up, said to Gibsy, "Just a moment. Colonel." and limped over to me. In a voice that reached me alone, he said, "Son, you promised me."

"And I withdraw it. You had no business exacting a promise from a man about his wife. You were talking out of turn."

"You've no business here, son. You are not skilled in these matters. For Mary's sake, get out."

Up to that moment it had not occurred to me to question the Old Man's right to stay—but I found myself announcing my decision as I made it. "You are the one with no business here—*you* are not an analyst. So get out."

The Old Man glanced at Mary and so did I. Nothing showed in her face; she might have been waiting for me to make change. The Old Man said slowly, "You been eating raw meat, son?"

I answered, "It's my wife who is being experimented on; from here on I make the rules—or there won't be any experiments."

Colonel Gibsy butted in with, "Young man, are you out of your mind?"

I said, "What's your status here?" I glanced at his hands and added, "That's a V.M.I, ring, isn't it? Have you any other qualifications? Are you an M.D.? Or a psychologist?"

He drew himself up and tried to look dignified—pretty difficult dressed in your skin, unless your dignity is built in, the way Mary's is. "You seem to forget that this is a military reservation."

"And you seem to forget that my wife and I aren't military personnel!" I added, "Come on, Mary. We're leaving."

"Yes, Sam."

I added to the Old Man, "I'll tell the offices where to send our mail." I started for the door with Mary following me.

The Old Man said, "Just a moment, as a favor to me." I stopped and he went on to Gibsy, "Colonel, will you step outside with me? I'd like a word in private."

Colonel Gibsy gave me a general-court-martial look but he went. We all waited. Mary sat down but I did not. The juniors continued to be poker-faced, the lieutenant colonel looked perturbed, and the little sergeant seemed about to burst. Steelton was the only one who appeared unconcerned. He took papers out of his "incoming" basket and commenced quietly to work on them.

It was ten or fifteen minutes later that a sergeant came in. "Dr. Steelton, the Commanding Officer says to go ahead."

"Very well. Sergeant," he acknowledged, then looked at me, and said, "Let's go into the operating room."

I said, "Not so fast. Who are the rest of these supernumeraries? How about them?" I indicated the lieutenant colonel.

"Eh? He's Dr. Hazelhurst—two years on Venus."

"Okay, he stays." I caught the eye of the sergeant with the grin and said, "What's your job here, sister?"

"Me? Oh, I'm sort of a chaperone."

"I'm taking over the chaperone business. Now, Doctor, suppose you sort out the spare wheels from the people you actually need for your work."

"Certainly, sir." It turned out that he wanted no one but Colonel Hazelhurst. I gathered an impression that he was glad to get rid of the gallery. We went on inside—Mary, myself, and the two specialists.

The operating room contained a psychiatrist's couch surrounded by a semicircle of chairs. The double snout of a tri-dim camera poked unobtrusively out of the overhead; I suppose the mike was hidden in the couch. Mary went to the couch and sat down; Dr. Steelton got out an injector. "We'll try to pick up where we left off, Mrs. Nivens."

I said, "Just a moment. You have records of the earlier attempts?"

"Of course."

"Let's play them over first. I want to come up to date."

He hesitated, then answered, "If you wish. Mrs. Nivens, I suggest that you wait in my office. No, it will take quite a long time; suppose I send for you later?"

It was probably just the contrary mood that I was in; bucking the Old Man had gotten me hiked up with adrenaline. "Let's find out first if she *wants* to leave."

Steelton looked surprised. "You don't know what you are suggesting. These records would be emotionally disturbing to your wife, even harmful."

Hazelhurst put in, "Very questionable therapy, young man."

I said, "This isn't therapy and you know it. If therapy had been your object you would have used eidetic recall technique instead of drugs."

Steelton looked worried. "There was not time for that. We had to use rough methods for quick results. I'm not sure that I can authorize the subject to see the records."

Hazelhurst put in, "I agree with you. Doctor."

I exploded. "Damn it, nobody asked you to authorize anything and you haven't got any authority in the matter. Those records were snitched right out of my wife's head and they belong to *her*. I'm sick of you people trying to play God. I don't like it in a slug and I don't like it any better in a human being. She'll make up her own mind whether or not she wants to see them and whether or not I or anybody else will see them. Now *ask her*!"

Steelton said, "Mrs. Nivens, do you wish to see your records?"

Mary answered, "Yes, Doctor, I'd like very much to see them."

He seemed surprised. "Uh, to be sure. Do you wish to see them by yourself?" He glanced at me.

"My husband and I will see them. You and Dr. Hazelhurst are welcome to remain, if you wish."

Which they did. Presently a whole stack of tape spools were brought in, each labeled with attributed dates and ages. It would have taken us hours to go through them all, so I discarded those which concerned Mary's life after about 1991. I could not see how they could affect the problem and Mary could see them later if she wished.

We started out with her very early life. Each record started with the subject—Mary, that is—choking and groaning and struggling the way people always do when they are being forced back on a memory track which they would rather not follow, then would come the reconstruction, both in Mary's voice and in other voices. What surprised me most was Mary's face—in the tank, I mean. We had the magnification stepped up so that the stereo image of her face was practically in our laps and one could follow every change of expression.

First her face became that of a little girl—oh, her features were the same grownup features but I knew that I was seeing my darling as she must have been when she was very small. It made me hope that we would have a little girl ourselves.

Then her expression would change to match when other actors out of her memory took over. It was like watching an incredibly able monologist playing many parts.

Mary took it with apparent serenity but her hand stole into mine. When we came to the terrible part when her parents changed, became not her parents but slaves of slugs, she clamped down on my fingers so hard that it would have crushed a hand less hamlike than my own. But she controlled herself.

I skipped over the spools marked "period of suspended animation". I was surprised to find that there were a great many of them; I would have thought that there was nothing to dig out of the memory of a person in such a condition. Be that as it may, I could not see how she could have learned anything during that period which would tell us how the slugs had died, so I left them out and proceeded to the group concerned with the time from her resuscitation to the group concerned with her rescue from the swamps.

One thing was certain from her expressions in the imaged record: she had been possessed by a slug as soon as she was revived. The dead quality of her face was that of a slug not bothering to keep up a masquerade; the stereocasts from Zone Red were full of that expression. The barren qualities of her memories from that period confirmed it.

Then, rather suddenly, she was no longer hag-ridden but was again a little girl, a very sick and frightened little girl. There was a delirious quality to her remembered thoughts, but, at the last, a new voice came out loud and clear; "Well, skin me alive come Sunday! Look, Pete—it's a little girl!"

Another voice answered, "Alive?" and the first voice answered, "I don't know."

The rest of that tape carried on into Kaiserville, her recovery, and many new voices and memories; presently it ended.

"I suggest," Dr. Steelton said as he took the tape out of the projector, "that we play another one of the same period. They are all slightly different and this period is the key to the whole matter."

"Why, Doctor?" Mary wanted to know.

"Eh? Of course you need not see them if you don't want to—but this period is the one which we are actually investigating. From your memories we must build up a picture of what happened to the parasites on Venus, why they died. In particular, if we could tell just what killed the titan which, uh, possessed you before you were found—what killed it and left you alive—we might well have the weapon we need."

"But don't you *know*?" Mary asked wonderingly.

"Eh? Not yet, not yet—but we'll get it. The human memory is an amazingly complete record, even though unhandy to use."

"But I can tell you now—I thought you knew. It was 'nineday fever'."

"*What*?" Hazelhurst was out of his chair as if prodded.

"But of course. Couldn't you tell from my face? It was utterly characteristic—the mask, I mean. I saw it several times; I used to nurse it back ho—back in Kaiserville, because I had had it once and was immune to it."

Steelton said, "How about it Doctor? Have you ever seen a case of it?"

"Seen a case? No, I can't say that I have; by the time of the second expedition they had the vaccine for it. I'm thoroughly acquainted with its clinical characteristics, of course."

"But can't you tell from this record?"

"Well," Hazelhurst answered carefully, "I would say that what we have seen is consistent with it—but not conclusive, not conclusive."

"What's not conclusive?" Mary said sharply. "I told you it was 'nineday fever'."

"We must be sure," Steelton said apologetically.

"How sure can you get? There is no question about it. I was told that I had had nineday fever, that I had been sick with it when Pete and Frisco found me. I nursed other cases later and I never caught it again. I remember what their faces looked like when they were ready to die—just like my own face in the record. Anyone who has ever seen a case never forgets it and could not possibly mistake it for anything else. What more do you want? Fiery letters in the sky?" I have never seen Mary so close to losing her temper—except once. I said to myself: look out, gentlemen, better duck!

Steelton said, "I think you have proved your point, dear lady—but tell me: you were believed to have no memory of this period and my own experience with you leads me to think so. Now you speak as if you had direct, conscious memory—yes?"

Mary looked puzzled. "I remember it now—I remember it quite clearly. I haven't thought about it in many years."

"I think I understand." He turned to Hazelhurst. "Well, Doctor? Do we have a culture of it in the laboratory? Have your boys done any work on it?"

Hazelhurst seemed stunned. "Work on it? Of course not! It's utterly out of the question—nineday fever! We might as well use polio—or typhus. I'd rather treat a hangnail with an ax!"

I touched Mary's arm and said, "Let's go, darling. I think we have done all the damage we can." As we left I saw that she was trembling and that her eyes were full of tears. I took her into the messroom for systemic treatment—distilled.

Later on I bedded Mary down for a nap and sat with her until I was sure she was asleep. Then I looked up my father; he was in the office they had assigned to him. The green privacy light was already on. "Howdy," I said.

He looked at me speculatively. "Well, Elihu, I hear that you hit the jackpot."

"I prefer to be called 'Sam'," I answered.

"Very well, Sam. Success is its own excuse; nevertheless the jackpot appears to be disappointingly small. The situation seems to be almost as hopeless as before. Nineday fever—no wonder the colony died out and the slugs as well. I don't see how we can use it. We can't expect everyone to have Mary's indomitable will to live."

I understood him; the fever carried a 98-percent plus death rate among unprotected Earthmen. With those who had taken the shots the rate was an effective zero—but that did not figure. We needed a bug that would just make a man sick—but would kill his slug. "I can't see that it makes much difference," I pointed out. "It's odds-on that you will have typhus—or plague—or both—throughout the Mississippi Valley in the next six weeks."

"Or the slugs may have learned a lesson from the setback they took in Asia and will start taking drastic sanitary measures," he answered. I had not thought of that; the idea startled me so that I almost missed the next thing he said, which was: "No, Sam, you'll have to devise a better plan than that."

"*I'll* have to? I just work here."

"You did once—but now you've taken charge. I don't mind; I was ready to retire anyhow."

"Huh? What the devil are you talking about? I'm not in charge of anything—and don't want to be. You are head of the Section."

He shook his head. "A boss is the man who does the bossing. Titles and insignia usually come after the fact, not before. Tell me—do you think Oldfield could take over my job?"

I considered it and shook my head; Dad's chief deputy was the executive officer type, a "carry-outer", not a "think-upper". "I've known that you would take over, some day," he went on. "Now you've done it—by bucking my judgment on an important matter, forcing your own on me, and by being justified in the outcome."

"Oh, rats! I got bullheaded and forced one issue. It never occurred to you big brains that you were failing to consult the one real Venus expert you had on tap—Mary, I mean. But I didn't expect to find out anything; I had a lucky break."

He shook his head. "I don't believe in luck, Sam. Luck is a tag given by the mediocre to account for the accomplishments of genius."

I placed my hands on the desk and leaned toward him. "Okay, so I'm a genius—just the same you are not going to get me to hold the sack. When this is over Mary and I are going up in the mountains and raise kittens and kids. We don't intend to spend our time bossing screwball agents."

He smiled gently as though he could see farther into the future than I could. I went on, "I don't *want* your job—understand me?"

"That is what the Devil said to the Deity after he displaced him—but he found he could not help himself. Don't take it so hard, Sam. I'll keep the title for the present and give you all the help I can. In the meantime, what are your orders, sir?"

XXXI

The worst of it was, he meant it. I tried to correct matters by going limp on him, but it did not work. A top-level conference was called late that afternoon; I was notified but I stayed away. Shortly a very polite little WAC came to tell me that the commanding officer was waiting and would I please come at once?

So I went—and tried to stay out of the discussion. But my father has a way of conducting any meeting he is in, even if he is not in the chair, by looking expectantly at the one he wants to hear from. It's a subtle trick, as the group does not know that it is being led.

But *I* knew. With every eye in the room on you, it is easier to voice an opinion than to keep quiet. Particularly as I found that I had opinions.

The meeting was largely given over to moaning and groaning about the utter impossibility of using nineday fever against the slugs. Admitted that it would kill slugs—it would even kill Venerians who can be chopped in two and still survive. But it was sure death to any human—or almost any human; I was married to one who *had* survived—death to the enormous majority. Seven to ten days after exposure, then curtains.

"Yes, Mr. Nivens?" It was the commanding general, addressing me. I hadn't said anything but Dad's eyes were on me, waiting.

"I think there has been a lot of despair voiced at this session," I said, "and a lot of opinions given that were based on assumptions. The assumptions may not be correct."

"Yes?"

I did not have an instance in mind; I had been shooting from the hip. I continued to do so. "Well . . . for example—I hear constant reference to nineday fever as if the 'nineday' part were an absolute fact. It's not."

The boss brass shrugged impatiently. "It's a convenient tag—it averages nine days."

"Yes—but how do you know it lasts nine days—*for a slug*?"

By the murmur with which it was received I knew that I had hit the jackpot again.

A few minutes later I was being invited to explain why I thought the fever might run a different time in slugs and, if so, why it mattered. I began to feel like the after-dinner speaker who wishes he had not gotten up in the first place. But I bulled on ahead. "As to the first point," I said, "according to the record I saw this morning in the only case we know about the slug did die in less than nine days—quite a lot less. Those of you who have seen the records on my wife—and I gather that entirely too many of you have—are aware that her parasite left her, presumably dropped off and died, long before the eighth-day crisis. One datum does not fair a curve, but if it is true and experiments show it to be, then the problem is very different. A man infected with the fever might be rid of his slug in—oh, call it four days. That gives you five days to catch him and cure him."

The general whistled. "That's a pretty heroic solution, Mr. Nivens. How do you propose to cure him? For that matter, how do you propose to catch him? I mean to say, suppose we do plant an epidemic of nineday fever in Zone Red, it would take some incredibly fast footwork—in the face of stubborn resistance, remember—to locate and treat more than fifty million people before they died of the fever."

It was a hot potato, so I slung it right back. I wondered as I did so how many "experts" made their names by passing the buck. "As to the second question, that is a logistical and tactical problem—*your* problem, not mine. As to the first, there is your expert." I pointed to Dr. Hazelhurst. "Ask him."

Hazelhurst huffed and puffed and I knew how he felt. Insufficient former art . . . more research needed . . . experiments would be required . . . he seemed to recall that some work had been done toward an antitoxin treatment but the vaccine for immunizing had proven so successful that he was not sure the antitoxin had ever been perfected. Anyway, everyone who went to Venus nowadays was immunized before leaving. He concluded lamely by saying that the study of the exotic diseases of Venus was necessarily still in its infancy.

The general interrupted him as he was finishing. "This antitoxin business—how soon can you find out about it?"

Hazelhurst said he would get after it at once, there was a man at the Sorbonne he wanted to phone.

"Do so," his commanding officer said. "You are excused."

Hazelhurst came buzzing at our door before breakfast the next morning. I was annoyed but tried not to show it when I stepped out into the passage to see him. "Sorry to wake you," he said, "but you were right about that antitoxin matter."

"Huh?"

"They are sending me some from Paris; it should arrive any minute now. I do hope it's still potent."

"And if it isn't?"

"Well, we have the means to make it. We'll have to make it, of course, if this wild scheme is used—millions of units of it."

"Thanks for telling me," I said. "I know the general will be pleased." I started to turn away; he stopped me.

"Uh, Mr. Nivens—"

"Yes?"

"About the matter of vectors—"

"Vectors?" At the moment all the word meant to me was little arrows pointing in various directions.

"Disease vectors. We can't use rats or mice or anything like that. Do you happen to know how the fever is transmitted on Venus? By a little flying rotifer, the Venerian equivalent of an insect—but we don't have such here and that is the *only* way it can be carried."

"Do you mean to say you couldn't give it to me if you tried? Even with a jugful of live culture?"

"Oh, yes—I could inject you with it. But I can't picture a million paratroopers dropping into Zone Red and asking the parasite-ridden population to hold still while they gave them injections." He spread his hands helplessly.

Something started turning slowly over in my brain . . . a million men, in a single drop. "Why ask me?" I said. "It seems to be a medical problem."

"Uh, yes, it is of course. I just thought—Well, you seemed to have a ready grasp—" He paused.

"Thanks." My mind was struggling with two problems at once and beginning to have traffic problems. How many people were there in Zone Red? "Let me get this straight: suppose you had the fever and I didn't; I could not catch it from you?" The drop could not be medical men; there weren't that many.

"Not very easily. If I took a live smear from my throat and placed it in your throat, you might contract it. If I opened a vein of mine and made a trace transfusion to your veins, you would be sure to be infected with it."

"Direct contact, eh?" How many people could one paratrooper service? Ten? Twenty? Thirty? Or more? "If that is what it takes, you don't have any problem."

"Eh?"

"What's the first thing one slug does when he runs across another slug he hasn't seen lately?"

"*Conjugation*!"

" 'Direct conference', I've always called it—but then I use the sloppy old slug language for it. Do you think that would pass on the disease?"

"Think so? I'm sure of it! We have demonstrated, right here in this laboratory, that there is actual exchange of living protein during conjugation. They could not possibly escape direct transmission; we can infect the whole colony as if it were one body. Now why didn't I think of that?"

His words roused out a horrid memory, something about, "Would that my subjects had but one neck—" But I refrained from quoting it. "Don't go off half cocked," I said. "Better try it first. But I suspect that it will work."

"It will, it will!" He started to go, then stopped. "Oh, Mr. Nivens, would you mind very much—I know it's a great deal to ask—"

"What is? Speak up; I'm getting hungry." Actually I was anxious to work out the rest of the other problem.

"Well, would you consider permitting me to announce this method of vectoring in my report this morning? I'll give you full credit, but the general expects so much and this is just what I need to make my report complete." He looked so anxious that I almost laughed.

"Not at all," I said. "It's your department."

"That's decent of you. I'll try to return the favor." He turned away feeling happy and I turned back feeling the same way. I was beginning to like being a "genius".

I waited before reopening the door to our cubicle until I had straightened out in my mind all the main features of the big drop. Then I went in. Mary opened her eyes when I came in and gave me that long heavenly smile. I reached down and smoothed her hair. "Howdy, flame top, did you know that your husband is a genius?"

"Yes."

"You did? You never said so."

"You never asked me."

Hazelhurst gave credit all right; he referred to it as the "Nivens vector". I suppose it was natural that I should be asked to comment, though Dad looked my way first.

"I agree with Dr. Hazelhurst," I started out, "subject to experimental confirmation as outlined. However, he has properly left open for discussion certain aspects which are tactical rather than medical. While it is true that the entire body of titans might be infected from one contact, important considerations of timing—crucial, I should say—" I had worked out my whole opening speech, even to the hesitations, while eating breakfast. Mary does not chatter at breakfast, thank goodness!

"—require vectoring from many focal points. If we are to save a nominal hundred percent of the population of Zone Red, it is necessary that all the parasites be infected at as nearly the same time as possible in order that rescue squads may enter Zone Red *after* the slugs are no longer dangerous and *before* any host has passed the point where antitoxin can save him. The problem is susceptible to mathematical analysis—" Sam boy, I said to myself, you old phony, you could not solve it with an electronic integrator and twenty years of sweat. "—and should be turned over to your analytical section. However, let me sketch out the factors. Call the number of vector origins 'X'; call the number of rescue workers who much be dropped 'Y'. There will be an indefinitely large number of simultaneous solutions, with the optimum solution depending on logistic factors. Speaking in advance of rigorous mathematical treatment—" I had done my very damndest with a slipstick, but I did not mention that. "—and basing my opinions on my own unfortunately-too-intimate knowledge of their habits, I would estimate that—"

They let me go right ahead. You could have heard a pin drop, if anybody in that bare-skinned crew had had a pin. The general interrupted me once when I placed a rather low estimate on "X"; "Mr. Nivens. I think we can assure you of any number of volunteers for vectoring."

I shook my head. "You can't accept volunteers, General."

"I think I see your objection. The disease would have to be given time to establish itself in the volunteer and the timing might be dangerously close for his safety. But I think we could get around that—a gelatin capsule with the antitoxin embedded in tissue, or something of the sort. I'm sure the staff could work it out."

I thought they could, too, but I did not say that my real objection was a deep-rooted aversion to any additional human soul having to be possessed by a slug. "You *must not* use human volunteers, sir. The slug will know everything that his host knows—and he simply will not go into direct conference; he'll warn the others by word of mouth instead." I did not know that I was right but it sounded plausible. "No, sir, we will use animals—apes, dogs, anything large enough to carry a slug but incapable of human speech, and in sufficient quantities to infect the whole group before any slug knows that it is sick."

I went on to give a fast sketch of the final drop, Schedule Mercy, as I visualized it. "We can assume that the first drop—Schedule Fever—can start as soon as we are sure that we will have enough units of antitoxin for the second drop. In less than a week thereafter there should be no slug left alive on this continent."

They did not applaud, but it felt that way. The general adjourned the meeting and hurried away to call Air Marshal Rexton, then sent his aide back to invite me to lunch. I sent word that I would be pleased provided the invitation included my wife, otherwise I would be unable to accept.

Dad waited for me outside the conference room. "Well, how did I do?" I asked him, more anxiously than I tried to sound.

He shook his head. "Sam, you wowed 'em. You have the makings of a politician. No, I think I'll sign you up for twenty-six weeks of stereo instead."

I tried not to show how much I was pleased. I had gotten through the whole performance without once stammering; I felt like a new man.

XXXII

That ape Satan which had wrung my heart so back at the National Zoo turned out to be as mean as he was billed, once he was free of his slug. Dad had volunteered to be the test case for the Nivens-Hazelhurst theories, but I put my foot down and Satan drew the short straw.

Dad made an issue out of it; he had some silly idea that it was up to him to be possessed by a slug, at least once. I told him that we had no time to waste on his sinful pride. He grew huffy but I made it stick.

It was neither filial affection nor its neoFreudian antithesis that caused me to balk him; I was afraid of the combination of Dad-cum-slug. I did not want him on *their* side even temporarily and under laboratory conditions. Not with his shifty, tricky mind! I did not know how he would manage to escape nor what he would do to wreck our plans, but I was morally certain he would, once possessed.

People who have never experienced possession, even those who have seen it, cannot appreciate that the host is utterly *against* us—with all his abilities intact. We could not risk having Dad against us—and I swung enough weight to overrule him.

So we used anthropoid apes for the experiments. We had on hand not only apes from the National Zoological Gardens but simian citizens from half a dozen zoos and a couple of circuses. I did not select Satan for the job; I would have let the poor beast be. The look of patient suffering on his face made one forget the slug on his back.

Satan was injected with nineday fever on Wednesday the 13th. By Friday the fever had established; another chimp-cum-slug was introduced into his cage; the two slugs immediately went into direct conference, after which the second ape was removed.

On Sunday the 17th Satan's master shriveled up and fell off—dead. Satan was immediately injected with the antitoxin. Late Monday the other slug died and its host was dosed.

By Wednesday Satan was well though a bit thin and the second ape, Lord Fauntleroy, was on the road to recovery. I gave Satan a banana to celebrate and he took off the first joint of my left index finger and me with no time for a repair job. It was no accident either;

that ape was nasty.

But a minor injury could not depress my spirits. After I had it dressed I looked for Mary, as I wanted to crow; I failed to find her and ended up in the messroom, wanting someone with whom to share a toast.

The place was empty; everyone in the labs—except me—was working harder than ever, mounting Schedule Fever and Schedule Mercy. By order of the President all possible preparations were taking place in this one lab in the Smoky Mountains. The apes for vectoring, some two hundred of them, were here, and both the culture and the antitoxin were being "cooked" here; the horses needed for serum were stalled in what had been an underground handball court.

The million-plus men necessary for the Schedule Mercy drop could not be here, but they would know nothing about it until alerted a few hours before the drop, at which time each would be issued a hand gun and two bandoleers of individual dose antitoxin injectors. Those who had never parachuted before would not be given a chance to practice; they would each be pushed, if necessary, by some sergeant with a large foot. Everything possible was being done to keep the secret close; the only way I could see that we could lose (now that we knew that our theories worked) would be for the titans to find out our plans, through a renegade or by whatever means. Too many good plans have failed because some fool told his wife about it in bed.

If we failed to keep this secret, our ape disease vectors would never get into direct conference; they would be shot on sight wherever they appeared in the titan nation. But I relaxed over my first drink, happy and reasonably sure that the secret could not leak. Traffic with the laboratory was "incoming only" until after Drop Day and Colonel Kelly censored or monitored all communication outward—Kelly was no fool.

As for a leak from outside, the chances were slight. The general, Dad, Colonel Gibsy, and myself had gone to the White House the week before, there to see the President and Marshal Rexton. I had already convinced Dad that the way to keep this secret was not to share it with anybody; he put on a histrionic exhibition of belligerence and exasperation that got him what we wanted; in the end even Secretary Martinez was bypassed. If the President and Rexton could keep from talking in their sleep for another week, I did not see how we could miss.

A week would be none too soon; Zone Red was spreading. The counterattack they had launched at Pass Christian had not stopped there. The slugs had pushed on and now held the Gulf coast past Pensacola and there were signs that more was to come. Perhaps the slugs were growing tired of our resistance and might decide to waste human raw material by Abombing the cities we still held. If so, we would find it hard to stop; a radar screen can alert your defenses, but it won't stop a determined attack.

But I refused to worry about that. One more week—

Colonel Kelly came in, looked around the otherwise empty room, came over and sat down beside me. "How about a drink?" I suggested. "I feel like celebrating."

He examined the hairy paunch bulging out in front of him and said, "I suppose one more beer wouldn't put me in any worse shape."

"Have two beers. Have four—a dozen." I dialed for him, and told him about the success of the experiments with the apes.

He nodded. "Yes, I had heard. Sounds good."

" 'Good', the man says! Colonel, we are on the one yard line and goal to go. A week from now the game will be won."

"So?"

"Oh, come now!" I answered, irritated by his manner. "In a short time you'll be able to put your clothes back on and lead a normal life. Or don't you think our plans will work?"

"Yes, I think they will work."

"Then why the crepe-hanging?"

Instead of answering directly he said, "Mr. Nivens, you don't think that a man with my pot belly enjoys running around without his clothes, do you?"

"I suppose not. As for myself, I'm beginning to find it pleasant. I may hate to have to give it up—saves time and it's comfortable."

"You need not worry about having to give it up. This is a permanent change."

"Huh? I don't get you. You said our plans would work and now you talk as if Schedule Sun Tan would go on forever."

"In a modified way, it will."

I said, "Pardon me? I'm stupid today."

He dialed for another beer. "Mr. Nivens, I never expected to live to see a military reservation turned into a ruddy nudist camp. Having seen it happen, I never expect to see us change back—because we *can't*. Pandora's box has a one-way lid. All the king's horses and all the king's men—"

"Conceded," I answered. "Things never go back quite to what they were before. Just the same, you are exaggerating. The day after the President rescinds Schedule Sun Tan the suspended blue laws will go into effect and a man without pants will be liable to arrest."

"I hope not."

"Huh? Make up your mind."

"It's made up for me. Mr. Nivens, as long as there exists a possibility that a slug is alive the polite man must be willing to bare his entire body on request—or risk getting shot. Not just this week and next week but twenty years from now, or a hundred. No, no!" he said, seeing that I was about to interrupt, "I am not disparaging your fine plans—but pardon me if I say that you have been too busy with their details to notice that they are strictly local and temporary. For example—have you made any plans for combing the Amazonian jungles, tree by tree?"

He went on apologetically, "Just a rhetorical inquiry. This globe has nearly sixty million square miles of dry land; we can't begin to search it and clean out the slugs. Shucks, man, we haven't made a dent in the rats and we've been at that a long time. Titans are trickier and more prolific than rats."

"Are you trying to tell me it's hopeless?" I demanded.

"Hopeless? Not at all. Have another drink. I'm trying to say that we are going to have to learn to live with this horror, the way we had to learn to *live* with the atom bomb."

I went away feeling dashed and not at all cocky. I wanted to find Mary. Some days, it occurred to me, the "genius" business wasn't worth the trouble.

XXXIII

We were gathered in the same conference room in the White House; it put me in mind of the night after the President's message many weeks before. Dad was there; so were Mary and Rexton and Martinez. None of the "fishing cabinet" was present but their places were filled by our own lab general, by Dr. Hazelhurst, and by Colonel Gibsy. Martinez was busy trying to restore his face after having been told that he had been shunted out of the biggest show of his own department.

Nobody paid him any attention. Our eyes were on the big map still mounted across one wall; it had been four and a half days since the vector drop of Schedule Fever but the Mississippi Valley still glowed in ruby lights.

I was getting jittery, although the drop had been an apparent success and we had lost only three craft. According to the equations every slug within reach of direct conference should have been infected three days ago, with an estimated twentythree percent overlap. The operation had been computed to contact about eighty percent of the slugs in the first twelve hours alone, mostly in the large cities.

Soon, slugs should start dying a dam sight faster than flies ever did—*if* we were right.

I forced myself to sit still and wondered whether those ruby lights covered a few million very sick slugs—or merely two hundred dead apes. Had somebody skipped a decimal point? Or blabbed? Or had there been an error in our reasoning so colossal that we could not see it?

Suddenly a light blinked green, right in the middle of the board; everybody sat up. Right on top of it a voice began to come out of the stereo gear though no picture built up. "This is Station Dixie, Little Rock," a very tired southern voice said. "We need help very badly. Anyone who is listening, please be good enough to pass on this message: Little Rock, Arkansas, is in the grip of a terrible epidemic. Notify the Red Cross. We have been in the hands of—" The voice trailed off, whether from weakness or transmission failure I could not be sure.

I remembered to breathe. Mary patted my hand and I sat back, relaxing consciously. It was joy too great to be pleasure. I saw now that the green light had not been Little Rock, but farther west in Oklahoma. Two more lights blinked green, one in Nebraska and one north of the Canadian line. Another voice came over, a twangy New England voice; I wondered how he had gotten into Zone Red.

"A little like election night, eh, chief?" Martinez said heartily.

"A little," the President agreed, "but we do not usually get returns from Old Mexico." He pointed to the board; a pair of green lights were showing in Chihuahua.

"By George, you're right. Well, I guess 'State' will have some international incidents to straighten out when this is over, eh?"

The President did not answer and he shut up, to my relief. The President seemed to be talking to himself; he noticed me watching him, smiled, and spoke out loud:

" ' 'Tis said that fleas have little fleas,
Upon their backs to bite 'em,
And little fleas have lesser fleas,
And so, ad infinitum.' "

I smiled to be polite though I thought the notion was gruesome, under the circumstances. The President looked away and said, "Would anyone like supper? I find that I am hungry, for the first time in days."

By late the next afternoon the board was more green than red. Rexton had caused to be set up two annunciators keyed into the command center in the New Pentagon; one showed percentage of completion of the complicated score deemed necessary before the big drop; the other showed the projected time of drop. The figures on it changed from time to time, sometimes up, sometimes down. For the past two hours they had been holding fairly steady around 17.43, east coast time.

Finally Rexton stood up. "I'm going to freeze it at seventeen fortyfive," he announced. "Mr. President, if you will excuse me?"

"Certainly, sir."

Rexton turned to Dad and myself. "If you two Don Quixote's are still determined to go, now is the time."

I stood up. "Mary, you wait for me."

She asked, "Where?" It had already been settled—and not peacefully!—that she was not to go.

The President interrupted. "I suggest that Mrs. Nivens stay here. After all, she is a member of the family."

With the invitation he gave us his best smile and I said, "Thank you, sir." Colonel Gibsy got a very odd look.

Two hours later we were coming in on our target and the jump door was open. Dad and I were last in line, after the kids who would do the real work. My hands were sweaty and I stunk with the old curtain going-up stink. I was scared as hell—I never like to jump.

XXXIV

Gun in my left hand, antitoxin injector ready in my right, I went from door to door in my assigned block. It was an older section of Jefferson City, slums almost; it consisted of apartment houses built fifty years ago. I had given two dozen injections and had three dozen to go before it would be time for me to rendezvous at the State House. I was getting sick of it.

I knew why I had come—it was not just curiosity; I wanted to see them *die*! I wanted to watch them die, see them dead, with a weary hate that passed all other needs. But now I had seen them dead and I wanted no more of it; I wanted to go home, take a bath, and forget it.

It was not hard work, just monotonous and nauseating. So far I had not seen one live slug, though I had seen many dead ones. I had burned one skulking dog that appeared to have a hump; I was not sure as the light had been bad. We had hit shortly before sundown and now it was almost full dark.

The worst of it was the smells. Whoever compared the odor of unwashed, lousy, diseased humans with that of sheep was no friend to decent sheep.

I finished checking the rooms of the apartment building I was in, shouted to make sure, and went out into the street. It was almost deserted; with the whole population sick with the fever we found few on the streets. The lone exception was a man who came weaving toward me, eyes vacant. I yelled, "Hey!"

He stopped. I said, "You are sick, but I've got what you need to get well. Hold out your arm."

He struck at me feebly. I hit him carefully with my gun and he went face down. Across his back was the red rash of the slug; I avoided that area, picked a reasonably clean and healthy patch over his kidney and stuck in the injector, bending it to break the point after it was in. The units were gas-loaded; nothing more was needed. I did not even withdraw it, but left him.

The first floor of the next house held seven people, most of them so far gone that I did not bother to speak but simply gave them their shots and hurried on. I had no trouble. The second floor was like the first.

The top floor had three empty apartments, at one of which I had to burn out the lock to enter. The fourth flat was occupied, in a manner of speaking. There was a dead woman on the floor of the kitchen, her head bashed in. Her slug was still on her shoulders, but merely resting there, for it was dead, too, and beginning to reek. I left them quickly and looked around.

In the bathroom, sitting in an old-fashioned bathtub, was a middle-aged man. His head slumped on his chest and his wrist veins were open. I thought he was dead but he looked up as I bent over him. "You're too late," he said dully. "I killed my wife."

—or too soon, I thought. From the appearance of the bottom of the tub and by his gray face, five minutes later would have been better. I looked at him, wondering whether or not to waste an injection.

He spoke again. "My little girl—"

"You have a daughter?" I said loudly. "Where is she?"

His eyes flickered but he did not speak. His head slumped forward again. I shouted at him, then felt his jaw line and dug my thumb into his neck, but could find no pulse. As a favor to him I burned him carefully through the base of the brain before I left.

The child was in bed in one of the rooms, a girl of eight or so who would have been pretty had she been well. She roused and cried and called me Daddy. "Yes, yes," I said soothingly, "Daddy's going to take care of you." I gave her the injection in her leg; I don't think she noticed it.

I turned to go but she called out again. "I'm thirsty. Want a drink of water." So I had to go back into that bathroom again.

As I was giving it to her my phone shrilled and I spilled some of it. "Son! Can you hear me?"

I reached for my belt and switched on my phone. "Yes. What's up?"

"I'm in that little park just north of you. Can you come? I'm in trouble."

"Coming!" I put down the glass and started to leave—then caught by indecision, I turned back. I could not leave my new friend to wake up in that charnel house, a parent dead in each room. I gathered her up in my arms and stumbled down to the second floor. There I entered the first door I came to and laid her on a sofa. There were people in the flat, probably too sick to bother with her, but it was all I could do.

"Hurry, son!"

"On my way!" I dashed out of there and wasted no more breath talking to him, but made speed. Dad's assignment was directly north of mine, paralleling it and fronting on one of those pint-sized downtown parks. When I got around the block I did not see him at first and ran on past him.

"Here, son, over here—at the car!" This time I could hear him both through the phone and my bare ear. I swung around and spotted the car, a big Cadillac duo much like the Section often used. There was someone inside but it was too dark for me to see whether or not it was the Old Man. I approached cautiously until I heard him say, "Thank God! I thought you would never come," and knew that it was he.

I had to duck to get in through the door. It was then that he clipped me.

I came to, to find my hands tied and my ankles as well. I was in the second driver's seat of the car and the Old Man was in the other, at the controls. The wheel on my side was latched up out of the way. The sudden realization that the car was in the air brought me fully awake.

He turned and said cheerfully, "Feeling better?" I could see his slug, riding high on his shoulders.

"Some better," I admitted.

"Sorry I had to hit you," he went on, "but there was no other way."

"I suppose not."

"I'll have to leave you tied up for the present; you know that. Later on we can make better arrangements." He grinned, his old wicked grin. Most amazingly his own personality came through with every word the slug said.

I did not ask what "better arrangements" were possible; I did not need nor want to know. I concentrated on checking my bonds; I need not have bothered—the Old Man had given them his personal attention.

"Where are we going?" I asked.

"South." He fiddled with the controls. "'Way south. Just give me a moment to lay this heap in the groove and I will explain what's in store for us." He was busy for a few seconds, then said, "There—that will hold her until she levels off at thirty thousand."

The mention of that much altitude caused me to take a quick look at the control board. The duo did not merely look like one of the

Section's cars; it actually *was* one of our souped-up jobs. "Where did you get this car?" I asked.

"The Section had it cached in Jefferson City. I looked, and, sure enough, nobody had found it. Fortunate, wasn't it?"

There could be a second opinion on that point, I thought, but I did not argue. I was still checking the possibilities—and finding them somewhere between slim and hopeless. My own gun was gone, as I could tell by the pressure. He was probably carrying his on the side away from me; it was not in sight.

"But that was not the best of it," he went on; "I had the good luck to be captured by what was almost certainly the only healthy master in the whole of Jefferson City—not that I believe in luck. So we win after all." He chuckled. "It's like playing both sides of a very difficult chess game."

"You did not tell me where we are going?" I persisted. I did not know that it would help, but I was getting nowhere fast and talking was the only action open to me.

He considered. "Out of the United States, certainly. My master may be the only one free of nineday fever in the whole continent and I don't dare take a chance. I think the Yucatan peninsula would suit us—that's where I've got her pointed. We can hole up there and increase our numbers and work on south. When we do come back—and we will!—we won't make the same mistakes."

I said, "Dad, can't you take these ties off me? I'm losing circulation. You know you can trust me."

"Presently, presently—all in good time. Wait until we go full automatic." The car was still climbing; souped up or not, thirty thousand was a long pull for a car that had started out as a family model.

I said, "You seem to forget that I was with the masters a long time. I know the score—and I give you my word of honor."

He grinned. "Don't teach grandma how to steal sheep. If I let you loose now, you'll kill me or I'll have to kill you. And I want you alive. We're going places, son—you and me. We're fast and we're smart and we are just what the doctor ordered."

I did not have an answer. He went on, "Just the same—about you knowing the score: why didn't you tell me the score, son? Why did you hold out on me?"

"Huh?"

"You didn't tell me how it felt. Son, I had no idea that a man could feel such a sense of peace and contentment and wellbeing. This is the happiest I've been in years, the happiest since—" he suddenly looked puzzled, and then went on, "since your mother died. But never mind that; this is better. You should have told me."

Disgust suddenly poured over me and I forgot the cautious game I was playing. "Maybe I didn't see it that way. And neither would you, you crazy old fool, if you didn't have a filthy slug riding you, talking through your mouth, thinking with your brain!"

"Take it easy, son," he said gently—and so help me, his voice *did* soothe me. "You'll know better in a little while. Believe me, this is what we were intended for, this is our destiny. Mankind has been divided, warring with himself. The masters will make him whole again."

I thought to myself that there were probably custard heads just screwy enough to fall for such a line—surrender their souls willingly for a promise of security and peace. But I did not say so; I was clamping my jaws to keep from throwing up.

"But you need not wait much longer," he said suddenly, glancing at the board. "I'll nail her down in the groove." He adjusted his deadreckoner bug, checked his board, and set his controls. "That's a relief. Next stop: Yucatan. Now to work." He got out of his chair and knelt beside me in the crowded space. "Got to be safe," he said, as he strapped the safety belt across my middle.

I brought my knees up in his face.

He reared up and looked at me without anger. "Naughty, naughty. I could resent that—but the masters don't go in for resentment. Now be good." He went ahead, checking my wrists and feet. His nose was bleeding but he did not bother to wipe it. "You'll do," he said. "Now be patient; it won't be long."

He went back to the other control seat, sat down and leaned forward, elbows on knees. It brought his master directly into my view.

Nothing happened for some minutes, nor could I think of anything to do other than strain at my bonds. By his appearance, the Old Man was asleep, but I placed no trust in that.

A line formed straight down the middle of the horny brown covering of the slug.

As I watched it, it widened. Presently I could see the clotted opalescent horror underneath. The space between the two halves of the shell widened—and I realized that the slug was fissioning, sucking life and matter out of the body of my father to make two of itself.

I realized, too, with rigid terror, that I had no more than five minutes of individual life left to me. My new master was being born and soon would be ready to mount me.

Had it been humanly possible for flesh and bone to break the ties on me I would have broken them. I did not succeed. The Old Man paid no attention to my struggles. I doubt if he were conscious; the slugs must surely give up some measure of control while they are occupied with splitting. It must be that they simply immobilize the slave. As may be—the Old Man did not move.

By the time I had given up, worn out and sure that I could not break loose, I could see the ciliated silvery line down the center of the slug proper which means that fission is about to be complete. It was that which changed my line of reasoning, if there were reason left in my churning skull.

My hands were tied behind me, my ankles were tied, and I was belted tight across the middle to the chair. But my legs, even though fastened together, were free from my waist down; the seat had no knee belts.

I slumped down in the chair to get even more reach and swung my legs up high. I brought them down smashingly across the board—and set off every launching unit in her racks at once.

That adds up to a lot of g's—how many, I don't know, for I don't know how full her racks were. But there were plenty. We were both slammed back against the seats. Dad much harder than I was, since I was strapped down. He was thrown against the back of his seat, with his slug, open and helpless, crushed between the two masses.

It splashed.

And Dad himself was caught in that terrible, total reflex, that spasm of every muscle that I had seen three times before. He bounced forward against the wheel, face contorted, fingers writhing.

The car dived.

I sat there and watched it dive, if you call it sitting when you are held in place only by the belt. If Dad's body had not hopelessly fouled the controls I might have been able to do something about it—gotten her headed up again perhaps—with my bound feet. As it was, I tried but with no success at all. The controls were probably jammed as well as fouled.

The altimeter was clicking away busily. We had dropped to eleven thousand feet before I found time to glance at it. Then it was nine . . . seven . . . six—and we entered our last mile.

At fifteen hundred the radar interlock with the altimeter cut in and the nose units fired one at a time. The belt buffeted me across the stomach each time and I finally did throw up. I was thinking that I was saved, that now the ship would level off—though I should have known better. Dad being jammed up against the wheel as he was.

I was still thinking so as we crashed.

I came to by becoming slowly aware of a gently rocking motion. I was annoyed by it, I wanted it to stop; even a slight motion seemed to cause me more pain than I could bear. I managed to get one eye open—the other would not open at all—and looked dully around for the source of my annoyance.

Above me was the floor of the car, but I stared at it for a long time before I placed it as such. By the time I figured out what it was I was somewhat aware of where I was and what had happened. I remembered the dive and the crash—and realized that we must have crashed not into the ground but into some body of water—the Gulf of Mexico—but I did not really care.

With a sudden burst of grief I mourned my father.

The broken belt of my seat was flapping uselessly just above me. My hands were still tied and so were my ankles, and one arm at least seemed to be broken. One eye was stuck shut and it hurt me to breathe; I quit taking stock of my injuries. Dad was no longer plastered against the wheel and that puzzled me. With painful effort I rolled my head over to see the rest of the car with my one good eye. He was lying not far from me, three feet or so, from my head to his. He was bloody and cold and I was sure that he was dead. I think it took me about a half hour to cross that three feet.

I lay face to face with him, almost cheek to cheek. So far as I could tell there was no trace of life, nor, from the odd and twisted way in which he lay, did it seem possible.

"Dad," I said hoarsely. Then I screamed it. "*Dad*!"

His eyes flickered but did not open. "Hello, son," he whispered. "Thanks, boy, thanks—" His voice died out.

I wanted to shake him but all I could do was shout. "Dad! Wake up—are you all right?"

He spoke again, as if every word were a painful task. "Your mother—said to tell you . . . she was—proud of you." His voice died out again and his breathing was labored in that ominous dry-stick sound.

"Dad," I sobbed, "don't die—I can't get along without you."

His eyes opened wide. "Yes, you can, son." He paused and labored, then added, "I'm hurt, boy." His eyes closed again.

I could not get any more out of him, though I shouted and screamed. Presently I lay my face against his and let my tears mix with the dirt and blood.

XXXV

And now to clean up Titan!

Each of us who are going is writing one of these reports, for we know that we may not come back. If not, this is our legacy to free human beings—all that we learned and all that we know of how the titan parasites operate and what must be guarded against. For Kelly was right; there is no getting Humpty-Dumpty back together. In spite of the almost complete success of Schedule Mercy there is no way to be sure that the slugs are all gone. No longer ago than last week it was reported that a bear was shot, up Yukon way, wearing a hump.

The race will have to be always on guard; most especially it will have to be on guard about twenty-five years from now if we don't come back—but the flying saucers do. We don't know why the titan monsters follow the twenty-nine year cycle of Saturn's "year", but they do. The human race has many cycles which match the Earth year; the reasons may be equally simple for the titans. We hope that they are active only at one period of their "year"; if they are. Operation Vengeance may have easy pickings. Not that we are counting on it. I am going out, heaven help us, as an "applied psychologist (exotic)", but I am also a combat trooper, as is every one of us, from chaplain to cook. This is for keeps and we intend to show those slugs that they made the mistake of tangling with the toughest, meanest, deadliest, most unrelenting—and ablest—form of life in this section of space, a critter that can be killed but can't be tamed.

(I have a private hope that we will find some way to save the little elf creatures, the androgynes. We weren't able to save any of those in the saucer we found near Kansas City when the fighting was over, but that doesn't prove anything. I think we could get along with the elves. They are probably the real natives of Titan, anyhow; certainly they aren't related to the slugs.)

Whether we make it, or not, the human race has got to keep up its well-earned reputation for ferocity. If the slugs taught us anything, it was that the price of freedom is the willingness to do sudden battle, anywhere, any time, and with utter recklessness. If we did not learn that, well—"Dinosaurs, move over! We are ready to become extinct."

For who knows what dirty tricks may be lurking around this universe? The slugs may be simple and open and friendly compared with, let us say, the natives of the planets of Sirius. If this is just the opener, we had better learn from it for the main event. We thought space was empty and that we were automatically the lords of creation—even after we "conquered" space we thought so; Mars was already dead and Venus had not really gotten started. Well, if Man wants to be top dog—or even a respected neighbor—he'll have to fight for it. Beat the plowshares back into swords; the other was a maiden aunt's fancy.

Every one of us who is going has been possessed at least once. Only those who have been hag-ridden can know how tricky the slugs are, how constantly one must be on guard—or how deeply one must hate. The trip, they tell me, will take about twelve years, which will give Mary and me time to finish our honeymoon. Oh, yes, Mary is going; most of us are married couples and the single men are balanced by an equal number of single women. Twelve years isn't a trip; it's a way of living.

When I told Mary that we were going to Saturn her single comment was, "Yes, dear."

We'll have time for two or three kids, too. As Dad says, "The race must go on, even if it doesn't know where."

This report is loose-jointed in spots, and I can see that some must be cut and some must be censored before it is transcribed. But I have put everything into it, as I saw it and as I felt it, for war with another race is psychological war, not war of gadgets, and what I thought and what I felt may be more important than what I did.

I am finishing this report in Space Station Beta, from which we will transship to our vessel U.N.S. *Avenger*. I will not have time to make corrections; this will have to go as is, for the historians to have fun with. We said good-by to Dad last night at Pikes Peak Port and left our little girl with him. She did not understand and that was hard. But it was better so—and Mary and I will look into the matter of having another, at once.

When I said good-by Dad corrected me. "So long, you mean. You'll be back and I intend to hang on, getting crankier and meaner every year, until you do." I said I hoped so. He nodded. "You'll make it. You're too tough and mean to die. I've got a lot of confidence in you and the likes of you, son."

We are about to transship. I feel exhilarated. Puppet masters—the free men are coming to kill you!

Death and Destruction!

Between Planets

I

NEW MEXICO

"EASY, boy, easy."

Don Harvey reined in the fat little cow pony. Ordinarily Lazy lived up to his name; today he seemed to want to go places. Don hardly blamed him. It was such a day as comes only to New Mexico, with sky scrubbed clean by a passing shower, the ground already dry but with a piece of rainbow still hanging in the distance. The sky was too blue, the buttes too rosy, and the far reaches too sharp to be quite convincing. Incredible peace hung over the land and with it a breathless expectancy of something wonderful about to happen.

"We've got all day," he cautioned Lazy, "so don't get yourself in a lather. That's a stiff climb ahead." Don was riding alone because he had decked out Lazy in a magnificent Mexican saddle his parents had ordered sent to him for his birthday. It was a beautiful thing, as gaudy with silver as an Indian buck, but it was as out of place at the ranch school he attended as formal clothes at a branding — a point which his parents had not realized. Don was proud of it, but the other boys rode plain stock saddles; they kidded him unmercifully and had turned "Donald James Harvey" into "Don Jaime" when he first appeared with it.

Lazy suddenly shied. Don glanced around, spotted the cause, whipped out his gun, and fired. He then dismounted, throwing the reins forward so that Lazy would stand, and examined his work. In the shadow of a rock a fair-sized snake, seven rattles on its tail, was still twitching. Its head lay by it, burned off. Don decided not to save the rattles; had he pinpointed the head he would have taken it in to show his marksmanship. As it was, he had been forced to slice sidewise with the beam before he got it. If he brought in a snake killed in such a clumsy fashion someone would be sure to ask him why he hadn't used a garden hose.

He let it lie and remounted while talking to Lazy. "Just a no-good old sidewinder," he said reassuringly. "More scared of you than you were of it."

He clucked and they started off. A few hundred yards further on Lazy shied again, not from a snake this time but from an unexpected noise. Don pulled him in and spoke severely. "You bird-brained butterball! When are you going to learn not to jump when the telephone rings?"

Lazy twitched his shoulder muscles and snorted. Don reached for the pommel, removed the phone, and answered.

"Mobile 6-J-233309, Don Harvey speaking."

"Mr. Reeves, Don," came back the voice of the headmaster of Ranchito Alegre. "Where are you?"

"Headed up Peddler's Grave Mesa, sir."

"Get home as quickly as you can."

"Uh, what's up, sir?"

"Radiogram from your parents. I'll send the copter out for you if the cook is back with someone to bring your horse in."

Don hesitated. He didn't want just anybody to ride Lazy, like as not getting him overheated and failing to cool him off. On the other hand a radio from his folks could not help but be important. His parents were on Mars and his mother wrote regularly, every ship—but radiograms, other than Christmas and birthday greetings, were almost unheard of.

"I'll hurry, sir."

"Right!" Mr. Reeves switched off. Don turned Lazy and headed back down the trail. Lazy seemed disappointed and looked back accusingly.

As it turned out, they were only a half-mile from the school when the ranch copter spotted them. Don waved it off and took Lazy on in himself. Despite his curiosity he delayed to wipe down the pony and water it before he went in. Mr. Reeves was waiting in his office and motioned for him to come in. He handed Don the message.

It read: DEAR SON, PASSAGE RESERVED FOR YOU VALKYRIE CIRCUM-TERRA TWELVE APRIL LOVE MOTHER AND DAD.

Don blinked at it, having trouble taking in the simple facts. "But that's right away"

"Yes. You weren't expecting it?"

Don thought it over. He had halfway expected to go home—if one could call it going home when he had never set foot on Mars—at the end of the school year. If they had arranged his passage for the Vanderdecken three months from now . . . "Uh, not exactly. I can't figure out why they would send for me before the end of the term."

Mr. Reeves fitted his fingertips carefully together. "I'd say that it was obvious."

Don looked startled. "You mean? Mr. Reeves, you don't really think there is going to be trouble, do you?"

The headmaster answered gravely, "Don, I'm not a prophet. But it is my guess that your parents are sufficiently worried that they want you out of a potential war zone as quickly as possible."

He was still having trouble readjusting. Wars were something you studied, not something that actually happened. Of course his class in contemporary history had kept track of the current crisis in colonial affairs, but, even so, it had seemed something far away, even for one as widely traveled as himself—a matter for diplomats and politicians, not something real.

"Look, Mr. Reeves, they may be jumpy but I'm not. I'd like to send a radio telling them that I'll be along on the next ship, as soon as school is out."

Mr. Reeves shook his head. "No. I can't let you go against your parents' explicit instructions. In the second place, ah—" The headmaster seemed to have difficulty in choosing his words. "—that is to say, Donald, in the event of war, you might find your position here, shall we call it, uncomfortable?"

A bleak wind seemed to have found its way into the office. Don felt lonely and older than he should feel. "Why?" he asked gruffly.

Mr. Reeves studied his fingernails. "Are you quite sure where your loyalties lie?" he said slowly.

Don forced himself to think about it. His father had been born on Earth; his mother was a second-generation Venus colonial. But neither planet was truly their home; they had met and married on Luna and had pursued their researches in planetology in many sectors of the solar system. Don himself had been born out in space and his birth certificate, issued by the Federation, had left the question of his nationality open. He could claim dual citizenship by parental derivation. He did not think of himself as a Venus colonial; it had been so long since his family had last visited Venus that the place had grown unreal in his mind. On the other hand he had been eleven years old before he had ever rested his eyes on the lovely hills of Earth.

"I'm a citizen of the System," he said harshly.

"Mmmm—" said the headmaster. "That's a fine phrase and perhaps someday it will mean something. In the meantime, speaking as a friend, I agree with your parents. Mars is likely to be neutral territory; you'll be safe there. Again, speaking as your friend—things may get a little rough here for anyone whose loyalty is not perfectly clear."

"Nobody has any business questioning my loyalty; under the law, I count as native born!"

The man did not answer. Don burst out, "The whole thing is silly! If the Federation wasn't trying to bleed Venus white there wouldn't be any war talk."

Reeves stood up. "That will be all, Don. I'm not going to argue politics with you."

"It's true! Read Chamberlain's *Theory of Colonial Expansion*!"

Reeves seemed startled. "Where did you lay hands on that book? Not in the school library."

Don did not answer. His father had sent it to him but had cautioned him not to let it be seen; it was one of the suppressed books—on Earth, at least. Reeves went on, "Don, have you been dealing with a booklegger?"

Don remained silent. "Answer me!"

Presently Reeves took a deep breath and said, "Never mind. Go up to your room and pack. The copter will take you to Albuquerque at one o'clock."

"Yes, sir." He had started to leave when the headmaster called him back.

"Just a moment. In the heat of our, uh, discussion I almost forgot that there was a second message for you."

"Oh?" Don accepted the slip; it said: DEAR SON, BE SURE TO SAY GOODBYE TO UNCLE DUDLEY BEFORE YOU LEAVE — MOTHER.

This second message surprised him in some ways even more than the first; he had trouble realizing that his mother must mean Dr.

Dudley Jefferson—a friend of his parents but no relation, and a person of no importance in his own life. But Reeves seemed not to see anything odd in the message, so he stuck it in his Levis and left the room.

Long as he had been earthbound he approached packing with a true spaceman's spirit. He knew that his passage would entitle him to only fifty pounds of free lift; he started discarding right and left. Shortly he had two piles, a very small one on his own bed—indispensable clothing, a few capsules of microfilm, his slide rule, a stylus, and a vreetha, a flutelike Martian instrument which he had not played in a long time as his schoolmates had objected. On his roommate's bed was a much larger pile of discards.

He picked up the vreetha, tried a couple of runs, and put it on the larger pile. Taking a Martian product to Mars was coal to Newcastle. His roommate, Jack Moreau, came in as he did so. "What in time goes on? House cleaning?"

"Leaving."

Jack dug a finger into his ear. "I must be getting deaf. I could have sworn you said you were leaving."

"I am." Don stopped and explained, showing Jack the message from his parents.

Jack looked distressed. "I don't like this. Of course I knew this was our last year, but I didn't figure on you jumping the gun. I probably won't sleep without your snores to soothe me. What's the rush?"

"I don't know. I really don't. The Head says that my folks have war jitters and want to drag their little darling to safety. But that's silly, don't you think? I mean, people are too civilized to go to war today."

Jack did not answer. Don waited, then said sharply, "You agree, don't you? There won't be any war."

Jack answered slowly, "Could be. Or maybe not."

"Oh, come off it!"

His roommate answered, "Want me to help you pack?"

"There isn't anything to pack."

"How about all that stuff?"

"That's yours, if you want it. Pick it over, then call in the others and let them take what they like."

"Huh? Gee, Don, I don't want your stuff. I'll pack it and ship it after you."

"Ever ship anything 'tween planets? It's not worth it."

"Then sell it. Tell you what, we'll hold an auction right after supper."

Don shook his head. "No time. I'm leaving at one o'clock."

"What? You're really blitzing me, kid. I don't like this."

"Can't be helped." He turned back to his sorting.

Several of his friends drifted in to say goodbye. Don himself had not spread the news and he did not suppose that the headmaster would have talked, yet somehow the grapevine had spread the word. He invited them to help themselves to the plunder, subject to Jack's prior claim.

Presently he noticed that none of them asked why he was leaving. It bothered him more than if they had talked about it. He wanted to tell someone, anyone, that it was ridiculous to doubt his loyalty—and anyhow there wasn't going to be a war.

Rupe Salter, a boy from another wing, stuck his head in, looked over the preparations. "Running out, eh? I heard you were and thought I'd check up."

"I'm leaving, if that's what you mean."

"That's what I said. See here, 'Don Jaime,' how about that circus saddle of yours? I'll take it off your hands if the price is right."

"It's not for sale."

"Huh? No horses where you're going. Make me a price."

"It belongs to Jack here."

"And it's still not for sale," Moreau answered promptly.

"Like that, eh? Suit yourself." Salter went on blandly, "Another thing—you willed that nag of yours yet?"

The boys' mounts, with few exceptions, were owned by the school, but it was a cherished and longstanding privilege of a boy graduating to "will" his temporary ownership to a boy of his choice. Don looked up sharply; until that moment he had not thought about Lazy. He realized with sudden grief that he could not take the little fat clown with him—nor had he made any arrangements for his welfare. "The matter is settled," he answered, added to himself: as far as you are concerned.

"Who gets him? I could make it worth your while. He's not much of a horse, but I want to get rid of the goat I've had to put up with."

"It's settled."

"Be sensible. I can see the Head and get him anyhow. Willing a horse is a graduating privilege and you're ducking out ahead of time."

"Get out."

Salter grinned. "Touchy, aren't you? Just like all fogeaters, too touchy to know what's good for you. Well, you're going to be taught a lesson some day soon."

Don, already on edge, was too angry to trust himself to speak. "Fogeater," used to describe a man from cloudwrapped Venus, was merely ragging, no worse than "Limey" or "Yank"—unless the tone of voice and context made it, as now, a deliberate insult. The others looked at him, half expecting action.

Jack got up hastily from the bed and went toward Salter. "Get going, Salty. We're too busy to monkey around with you." Salter looked at Don, then back at Jack, shrugged and said, "I'm too busy to hang around here . . . but not too busy, if you have anything in mind."

The noon bell pealed from the mess hall; it broke the tension. Several boys started for the door; Salter moved out with them. Don hung back. Jack said, "Come on beans!"

"Jack?"

"Yeah?"

"How about you taking over Lazy?"

"Gee, Don? I'd like to accommodate you—but what would I do with Lady Maude?"

"Uh, I guess so. What'll I do?"

"Let me see—" Jack's face brightened. "You know that kid Squinty Morris? The new kid from Manitoba? He hasn't got a permanent yet; he's been taking his rotation with the goats. He'd treat Lazy right; I know, I let him try Maudie once. He's got gentle hands."

Don looked relieved. "Will you fix it for me? And see Mr. Reeves?"

"Huh? You can see him at lunch; come on."

"I'm not going to lunch. I'm not hungry. And I don't much want to talk to the Head about it."

"Why not?"

"Well, I don't know. When he called me in this morning he didn't seem exactly . . . friendly."

"What did he say?"

"It wasn't his words; it was his manner. Maybe I am touchy—but I sort of thought he was glad to see me go."

Don expected Jack to object, convince him that he was wrong. Instead he was silent for a moment, then said quietly, "Don't take it too hard, Don. The Head is probably edgy too. You know he's got his orders?"

"Huh? What orders?"

"You knew he was a reserve officer, didn't you? He put in for orders and got 'em, effective at end of term. Mrs. Reeves is taking over the school for the duration."

Don, already overstrained, felt his head whirling. For the duration? How could anyone say that when there wasn't any such thing?

"'Sfact," Jack went on. "I got it straight from cookie." He paused, then went on, "See here, old son—we're pals, aren't we?"

"Huh? Sure, sure!"

"Then give it to me straight: are you actually going to Mars? Or are you heading for Venus to sign up?"

"Whatever gave you that notion?"

"Skip it, then. Believe me; it wouldn't make any difference between us. My old man says that when it's time to be counted, the important thing is to be man enough to stand up." He looked at Don's face, then went on, "What you do about it is up to you. You know I've got a birthday coming up next month?"

"Huh? Yes, so you have."

"Come then, I'm going to sign up for pilot training. That's why I wanted to know what you planned to do."

"Oh."

"But it doesn't make any difference—not between us. Anyhow, you're going to Mars."

"Yes. Yes, that's right."

"Good!" Jack glanced at his watch. "I've got to run—or they'll throw my chow to the pigs. Sure you're not coming?"

"Sure."

"See you." He dashed out.

Don stood for a moment, rearranging his ideas. Old Jack must be taking this seriously—giving up Yale for pilot training. But he was wrong—he had to be wrong.

Presently he went out to the corral.

Lazy answered his call, then started searching his pockets for sugar. "Sorry, old fellow," he said sadly, "not even a carrot. I forgot." He stood with his face to the horse's cheek and scratched the beast's ears. He talked to it in low tones, explaining as carefully as if Lazy could understand all the difficult words.

"So that's how it is," he concluded. "I've got to go away and they won't let me take you with me." He thought back to the day their association had begun. Lazy had been hardly more than a colt, but Don had been frightened of him. He seemed huge, dangerous, and probably carnivorous. He had never seen a horse before coming to Earth; Lazy was the first he had ever seen close up.

Suddenly he choked, could talk no further. He flung his arms around the horse's neck and leaked tears.

Lazy nickered softly, knowing that something was wrong, and tried to nuzzle him. Don raised his head. "Goodbye, boy. Take care of yourself." He turned abruptly and ran toward the dormitories.

II

"MENE, MENE, TEKEL, UPHARSIN"

THE SCHOOL copter dumped him down at the Albuquerque field. He had to hurry to catch his rocket, as traffic control had required them to swing wide around Sandia Weapons Center. When he weighed in he ran into another new security wrinkle. "Got a camera in that stuff, son?" the weighmaster had inquired as he passed over his bags.

"No. Why?"

"Because we'll fog your film when we fluoroscope, that's why." Apparently X-ray failed to show any bombs hidden in his underwear; his bags were handed back and he went aboard the winged-rocket Santa Fe Trail, shuttling between the Southwest and New Chicago. Inside, he fastened his safety belts, snuggled down into the cushions, and waited.

At first the noise of the blastoff bothered him more than the pressure. But the noise doppplered away as they passed the speed of sound while the acceleration grew worse; he blacked out.

He came to as the ship went into free flight, arching in a high parabola over the plains. At once he felt great relief no longer to have unbearable weight racking his rib cage, straining his heart, turning his muscles to water—but, before he could enjoy the blessed relief, he was aware of a new sensation; his stomach was trying to crawl up his gullet.

At first he was alarmed, being unable to account for the unexpected and unbearably unpleasant sensation. Then he had a sudden wild suspicion could it? Oh, no! It couldn't be . . . not space sickness, not to him. Why, he had been born in free fall; space nausea was for Earth crawlers, groundhogs!

But the suspicion grew to certainty; years of easy living on a planet had worn out his immunity. With secret embarrassment he conceded that he certainly was acting like a groundhog. It had not occurred to him to ask for an antinausea shot before blastoff, though he had walked past the counter plainly marked with a red cross.

Shortly his secret embarrassment became public; he had barely time to get at the plastic container provided for the purpose. Thereafter he felt better, although weak, and listened halfheartedly to the canned description coming out of the loudspeaker of the country over which they were falling. Presently, near Kansas City, the sky turned from black back to purple again, the air foils took hold, and the passengers again felt weight as the rocket continued glider fashion on a long, screaming approach to New Chicago. Don folded his couch into a chair and sat up.

Twenty minutes later, as the field came up to meet them, rocket units in the nose were triggered by radar and the Santa F6 Trail braked to a landing. The entire trip had taken less time than the copter jaunt from the school to Alburquerque — something less than an hour for the same route eastward that the covered wagons had made westward in eighty days, with luck. The local rocket landed on a field just outside the city, next door to the enormous field, still slightly radioactive, which was both the main spaceport of the planet and the former site of Old Chicago.

Don hung back and let a Navajo family disembark ahead of him, then followed the squaw out. A movable slideway had crawled out to the ship; he stepped on it and let it carry him into the station. Once inside he was confused by the bustling size of the place, level after level, above and below ground. Gary Station served not merely the Santa Fe Trail, the Route 66, and other local rockets shuttling to the Southwest; it served a dozen other local lines, as well as ocean hoppers, freight tubes, and space ships operating between Earth and Circum-Terra Station—and thence to Luna, Venus, Mars, and the Jovian moons; it was the spinal cord of a more-than-worldwide empire.

Tuned as he was to the wide and empty New Mexico desert and, before that, to the wider wastes of space, Don felt oppressed and irritated by the noisy swarming mass. He felt the loss of dignity that comes from men behaving like ants, even though his feeling was not thought out in words. Still, it had to be faced—he spotted the triple globes of Interplanet Lines and followed glowing arrows to its reservation office.

An uninterested clerk assured him that the office had no record of his reservation in the Valkyrie. Patiently Don explained that the reservation had been made from Mars and displayed the radiogram from his parents. Annoyed into activity the clerk finally consented to phone Circum-Terra; the satellite station confirmed the reservation. The clerk signed off and turned back to Don. "Okay, you can pay for it here."

Don had a sinking feeling. "I thought it was already paid for?" He had on him his father's letter-of-credit but it was not enough to cover passage to Mars.

"Huh? They didn't say anything about it being prepaid."

At Don's insistence the clerk again phoned the space station. Yes, the passage was prepaid since it had been placed from the other end; didn't the clerk know his tariff book? Thwarted on all sides, the clerk grudgingly issued Don a ticket to couch 64, Rocket Ship Glory Road, lifting from Earth for Circum-Terra at 9:03:57 the following morning.

"Got your security clearance?"

"Huh? What's that?"

The clerk appeared to gloat at what was a legitimate opportunity to decline to do business after all. He withdrew the ticket. "Don't you bother to follow the news? Give me your ID."

Reluctantly Don passed over his identity card; the clerk stuck it in a stat machine and handed it back. "Now your thumb prints."

Don impressed them and said, "Is that all? Can I have my ticket?"

"'Is that all?' he says. Be here about an hour early tomorrow morning. You can pick up your ticket then—provided the I.B.I. says you can."

The clerk turned away. Don, feeling forlorn, did likewise. He did not know quite what to do next. He had told Headmaster Reeves that he would stay overnight at the Hilton Caravansary, that being the hotel his family had stopped at 18 years earlier and the only one he knew by name. On the other hand he had to attempt to locate Dr. Jefferson "Uncle Dudley"—since his mother had made such a point of it. It was still early afternoon; he decided to check his bags and start looking.

Bags disposed of, he found an empty communication booth and looked up the doctor's code, punched it into the machine. The doctor's phone regretted politely that Dr. Jefferson was not at home and requested him to leave a message. He was dictating it when a warm voice interrupted: "I'm at home to you, Donald. Where are you, lad?" The view screen cut in and he found himself looking at the somewhat familiar features of Dr. Dudley Jefferson.

"Oh I'm at the station, Doctor—Gary Station. I just got in."

"Then grab a cab and come here at once."

"Uh, I don't want to put you to any trouble, Doctor. I called because mother said to say goodbye to you." Privately he had hoped that Dr. Jefferson would be too busy to waste time on him. Much as he disapproved of cities he did not want to spend his last night on Earth exchanging politeness with a family friend; he wanted to stir around and find out just what the modern Babylon did have to offer in the way of diversion. His letter-of-credit was burning a hole in his pocket; he wanted to bleed it a bit.

"No trouble. See you in a few minutes. Meanwhile I'll pick out a fatted calf and butcher it. By the way, did you receive a package from me?" The doctor looked suddenly intent.

"A package? No."

Dr. Jefferson muttered something about the mail service. Don said, "Maybe it will catch up with me. Was it important?"

"Uh, never mind; we'll speak of it later. You left a forwarding address?"

"Yes, sir—the Caravansary."

"Well whip up the horses and see how quickly you can get here. Open sky."

"And safe grounding, sir." They both switched off. Don left the booth and looked around for a cab stand. The station seemed more jammed than ever, with uniforms much in evidence, not only those of pilots and other ship personnel but military uniforms of many corps—and always the ubiquitous security police. Don fought his way through the crowd, down a ramp, along a slidewalk tunnel, and finally found what he wanted. There was a queue waiting for cabs; he joined it.

Beside the queue was sprawled the big, ungainly saurian form of a Venerian "dragon." When Don progressed in line until he was beside it, he politely whistled a greeting.

The dragon swiveled one fluttering eyestalk in his direction. Strapped to the "chest" of the creature, between its forelegs and immediately below and in reach of its handling tendrils, was a small box, a voder. The tendrils writhed over the keys and the Venerian answered him, via mechanical voder speech, rather than by whistling in his own language. "Greetings to you also, young sir. It is pleasant indeed, among strangers, to hear the sounds one heard in the egg." Don noted with delight that the outlander had a distinctly Cockney accent in the use of his machine.

He whistled his thanks and a hope that the dragon might die pleasantly.

The Venerian thanked him, again with the voder, and added, "Charming as is your accent, will you do me the favor of using your own speech that I may practice it?"

Don suspected that his modulation was so atrocious that the Venerian could hardly understand it; he lapsed at once into human words. "My name is Don Harvey," he replied and whistled once more—but just to give his own Venerian name, "Mist on the Waters"; it had been selected by his mother and he saw nothing funny about it.

Nor did the dragon. He whistled for the first time, naming himself, and added via voder, "I am called 'Sir Isaac Newton.' " Don understood that the Venerian, in so tagging himself, was following the common dragon custom of borrowing as a name of convenience the name of some earthhuman admired by the borrower.

Don wanted to ask "Sir Isaac Newton" if by chance he knew Don's mother's family, but the queue was moving up and the dragon was lying still; he was forced to move along to keep from losing his place in line. The Venerian followed him with one oscillating eye and whistled that he hoped that Don, too, might die pleasantly.

There was an interruption in the flow of autocabs to the stand; a manoperated flatbed truck drew up and let down a ramp. The dragon reared up on six sturdy legs and climbed aboard. Don whistled a farewell—and became suddenly and unpleasantly aware that a security policeman was giving him undivided attention. He was glad to crawl into his autocab and close the cover.

He dialed the address and settled back. The little car lurched forward, climbed a ramp, threaded through a freight tunnel, and mounted an elevator. At first Don tried to keep track of where it was taking him but the tortured convolutions of the ant hill called "New Chicago" would have made a topologist dyspeptic; he gave up. The robot cab seemed to know where it was going and, no doubt, the master machine from which it received its signals knew. Don spent the rest of the trip fretting over the fact that his ticket had not yet been turned over to him, over the unwelcome attention of the security policeman, and, finally, about the package from Dr. Jefferson. The last did not worry him; it simply annoyed him to have mail go astray. He hoped that Mr. Reeves would realize that any mail not forwarded by this afternoon would have to follow him all the way to Mars.

Then he thought about "Sir Isaac." It was nice to run across somebody from home.

Dr. Jefferson's apartment turned out to be far underground in an expensive quarter of the city. Don almost failed to arrive; the cab had paused at the apartment door but when he tried to get out the door would not open. This reminded him that he must first pay the fare shown in the meter—only to discover that he had pulled the bumpkin trick of engaging a robot vehicle without having coins on him to feed the meter. He was sure that the little car, clever as it was, would not even deign to sniff at his letter-of-credit. He was expecting disconsolately to be carted by the machine off to the nearest police station when he was rescued by the appearance of Dr. Jefferson.

The doctor gave him coins to pay the shot and ushered him in. "Think nothing of it, my boy; it happens to me about once a week. The local desk sergeant keeps a drawer full of hard money just to buy me out of hock from our mechanical masters. I pay him off once a quarter, cumshaw additional. Sit down. Sherry?"

"Er, no, thank you, sir."

"Coffee, then. Cream and sugar at your elbow. What do you hear from your parents?"

"Why, the usual things. Both well and working hard and all that." Don looked around him as he spoke. The room was large, comfortable, even luxurious, although books spilling lavishly and untidily over shelves and tables and even chairs masked its true richness. What appeared to be a real fire burned in one corner. Through an open door he could see several more rooms. He made a high, and grossly inadequate, mental estimate of the cost of such an establishment in New Chicago.

Facing them was a view window which should have looked into the bowels of the city; instead it reflected a mountain stream and fir trees. A trout broke water as he watched.

"I'm sure they are working hard," his host answered. "They always do. Your father is attempting to seek out, in one short lifetime, secrets that have been piling up for millions of years. Impossible—but he makes a good stab at it. Son, do you realize that when your father started his career we hadn't even dreamed that the first system empire ever existed?" He added thoughtfully, "If it was the first." He went on, "Now we have felt out the ruins on the floor of two oceans and tied them in with records from four other planets. Of course your father didn't do it all, or even most of it—but his work has been indispensable. Your father is a great man, Donald — and so is your mother. When I speak of either one I really mean the team. Help yourself to sandwiches."

Don said, "Thank you," and did so, thereby avoiding a direct answer. He was warmly pleased to hear his parents praised but it did not seem to be quite the thing to agree heartily.

But the doctor was capable of carrying on the conversation unassisted. "Of course we may never know all the answers. How was the noblest planet of them all, the home of empire, broken and dispersed into space junk? Your father spent four years in the Asteroid Belt—you were along, weren't you? — and never found a firm answer to that. Was it a paired planet, like Earth-Luna, and broken up by tidal strains? Or was it blown up?"

"Blown up?" Don protested. "But that's theoretically impossible—isn't it?"

Dr. Jefferson brushed it aside. "Everything is theoretically impossible, until it's done. One could write a history of science in reverse by assembling the solemn pronouncements of highest authority about what could not be done and could never happen. Studied any mathematical philosophy, Don? Familiar with infinite universe sheafs and open-ended postulate systems?"

"Uh, I'm afraid not, sir."

"Simple idea and very tempting. The notion that everything is possible and I mean everything—and everything has happened. Everything. One universe in which you accepted that wine and got drunk as a skunk. Another in which the fifth planet never broke up. Another in which atomic power and nuclear weapons are as impossible as our ancestors thought they were. That last one might have its points, for sissies at least. Like me."

He stood up. "Don't eat too many sandwiches. I'm going to take you out to a restaurant where there will be food, among other things . . . and such food as Zeus promised the gods and failed to deliver."

"I don't want to take up too much of your time, sir." Don was still hoping to get out on the town by himself. He had a dismaying vision of dinner in some stuffy rich man's club, followed by an evening of highfalutin talk. And it was his last night on Earth.

"Time? What is time? Each hour ahead is as fresh as was the one we just used. You registered at the Caravansary?"

"No, sir, I just checked my bags at the station."

"Good. You'll stay here tonight; we'll send for your luggage later."

Dr. Jefferson's manner changed slightly. "But your mail was to be sent to the hotel?"

"That's right."

Don was surprised to see that Dr. Jefferson looked distinctly worried. "Well, we'll check into that later. That package I sent to you—would it be forwarded promptly?"

"I really don't know, sir. Ordinarily the mail comes in twice a day. If it came in after I left, it would ordinarily wait over until morning. But if the headmaster thought about it, he might have it sent into town special so that I would get it before up-ship tomorrow morning."

"Mean to say there isn't a tube into the school?"

"No, sir, the cook brings in the morning mail when he shops and the afternoon mail is chuted in by the Roswell copter bus."

"A desert island! Well . . . we'll check around midnight. If it hasn't arrived then—never mind." Nevertheless he seemed perturbed and hardly spoke during their ride to dinner.

The restaurant was misnamed The Back Room and there was no sign out to indicate its location; it was simply one of many doors in a side tunnel. Nevertheless many people seemed to know where it was and to be anxious to get in, only to be thwarted by a stern-faced dignitary guarding a velvet rope. This ambassador recognized Dr. Jefferson and sent for the maitre d'hotel. The doctor made a gesture understood by headwaiters throughout history, the rope was dropped, and they were conducted in royal progress to a ringside table. Don was bug-eyed at the size of the bribe. Thus he was ready with the proper facial expression when he caught sight of their waitress.

His reaction to her was simple; she was, it seemed to him, the most beautiful sight he had ever seen, both in person and in costume. Dr. Jefferson caught his expression and chuckled. "Don't use up your enthusiasm, son. The ones we have paid to see will be out there." He waved at the floor. "Cocktail first?"

Don said that he didn't believe so, thank you.

"Suit yourself. You are man high and a single taste of the fleshpots wouldn't do you any permanent harm. But suppose you let me order dinner for us?" Don agreed. While Dr. Jefferson was consulting with the captive princess over the menu, Don looked around. The room simulated outdoors in the late evening; stars were just appearing overhead. A high brick wall ran around the room, hiding the nonexistent middle distance and patching in the floor to the false sky. Apple trees hung over the wall and stirred in the breeze. An old-fashioned well with a well sweep stood beyond the tables on the far side of the room; Don saw another "captive princess" go to it, operate the sweep, and remove a silver pail containing a wrapped bottle.

At the ringside opposite them a table had been removed to make room for a large transparent plastic capsule on wheels. Don had never seen one but he recognized its function; it was a Martian's "perambulator," a portable airconditioning unit to provide the rare, cold air necessary to a Martian aborigine. The occupant could be seen dimly, his frail body supported by a metal articulated servo framework to assist him in coping with the robust gravity of the third planet. His pseudo wings drooped sadly and he did not move. Don felt sorry for him.

As a youngster he had met Martians on Luna, but Luna's feeble field was less than that of Mars; it did not turn them into cripples, paralyzed by a gravity field too painful for their evolutionary pattern. It was both difficult and dangerous for a Martian to risk coming to Earth; Don wondered what had induced this one. A diplomatic mission, perhaps?

Dr. Jefferson dismissed the waitress, looked up and noticed him staring at the Martian. Don said, "I was just wondering why he would come here. Not to eat, surely."

"Probably wants to watch the animals feeding. That's part of my own reason, Don. Take a good look around you; you'll never see the like again."

"No, I guess not—not on Mars."

"That's not what I mean. Sodom and Gomorrah, lad — rotten at the core and skidding toward the pit. '—these our actors, as I foretold you . . . are melted into air—' and so forth. Perhaps even 'the great globe itself.' I tally too much. Enjoy it; it won't last long."

Don looked puzzled. "Dr. Jefferson, do you like living here?"

"Me? I'm as decadent as the city I infest; it's my natural element. But that doesn't keep me from telling a hawk from a handsaw."

The orchestra, which had been playing softly from nowhere in particular, stopped suddenly and the sound system announced "News flash!" At the same time the darkening sky overhead turned black and lighted letters started marching across it. The voice over the sound system read aloud the words streaming across the ceiling: BERMUDA: OFFICIAL: THE DEPARTMENT OF COLONIAL AFFAIRS HAS JUST ANNOUNCED THAT THE PROVISIONAL COMMITTEE OF THE VENUS COLONIES HAS REJECTED OUR NOTE. A SOURCE CLOSE TO THE FEDERATION CHAIRMAN SAYS THAT THIS IS AN EXPECTED DEVELOPMENT AND NO CAUSE FOR ALARM.

The lights went up and the music resumed. Dr. Jefferson's lips were stretched back in a mirthless grip. "How appropriate!" he commented. "How timely! The handwriting on the wall."

Don started to blurt out a comment, but was distracted by the start of the show. The stage floor by them had sunk out of sight, unnoticed, during the news flash. Now from the pit thus created came a drifting, floating cloud lighted from within with purple and flame and rose. The cloud melted away and Don could see that the stage was back in place and peopled with dancers. There was a mountain in the stage background.

Dr. Jefferson had been right; the ones worth staring at were on the stage, not serving the tables. Don's attention was so taken that he did not notice that food had been placed in front of him. His host touched his elbow. "Eat something, before you faint."

"Huh? Oh, yes, sir!" He did so, busily and with good appetite but with his eyes on the entertainers. There was one man in the cast, portraying Tannhauser, but Don did not know and did not care whom he represented; he noticed him only when he got in the way. Similarly, he had finished two thirds of what was placed before him without noticing what he was eating.

Dr. Jefferson said, "Like it?"

Don did a double take and realized that the doctor was speaking of food, not of the dancers. "Oh, yes! It's awfully good." He examined his plate. "But what is it?"

"Don't you recognize it? Baked baby gregarian."

It took a couple of seconds for Don to place in his mind just what a gregarian was. As a small child he had seen hundreds of the little satyr-like bipeds—faunas gregariaus veneris Smythii—but he did not at first associate the common commercial name with the friendly, silly creatures he and his playmates, along with all other Venus colonials, had always called "moveovers" because of their chronic habit of crowding up against one, shouldering, nuzzling, sitting on one's feet, and in other ways displaying their insatiable appetite for physical affection.

Eat a baby moveover? He felt like a cannibal and for the second time in one day started to behave like a groundhog in space. He gulped and controlled himself but could not touch another bite.

He looked back at the stage. Venusberg disappeared, giving way to a tired-eyed man who kept up a rapid fire of jokes while juggling flaming torches. Don was not amused; he let his gaze wander around the room. Three tables away a man met his eyes, then looked casually away. Don thought about it, then looked the man over carefully and decided that he recognized him. "Dr. Jefferson?"

"Yes, Don?"

"Do you happen to know a Venus dragon who calls himself 'Sir Isaac Newton'?" Don added the whistled version of the Venerian's true name.

"Don't!" the older man said sharply.

"Don't what?"

"Don't advertise your background unnecessarily, not at this time.

Why do you ask about this, uh, 'Sir Isaac Newton'?" He kept his voice low with his lips barely moving.

Donald told him about the casual meeting at Gary Station. "When I got through I was dead sure that a security cop was watching me. And now that same man is sitting over there, only now he's not in uniform."

"Are you sure?"

"I think I'm sure."

"Mmm . . . you might be mistaken. Or he might simply be here in his off hours—though a security policeman should not be, not on his pay. See here, pay no further attention to him and don't speak of him again. And don't speak of that dragon, nor of anything else Venetian. Just appear to be having a good time. But pay careful attention to anything I say."

Don tried to carry out the instructions, but it was hard to keep his mind on gaiety. Even when the dancers reappeared he felt himself wanting to turn and stare at the man who had dampened the party. The plate of baked gregarian was removed and Dr. Jefferson ordered something for him called a "Mount Etna." It was actually shaped like a volcano and a plume of steam came out of the tip. He dipped a spoon into it, found that it was fire and ice, assaulting his palate with conflicting sensations. He wondered how anyone could eat it. Out of politeness he cautiously tried another bite. Presently he found that he had eaten all of it and was sorry there was not more.

At the break in the stage acts Don tried to ask Dr. Jefferson what he really thought about the war scare. The doctor firmly turned the talk around to his parents' work and branched out to the past and future of the System. "Don't fret yourself about the present, son. Troubles, merely troubles—necessary preliminaries to the consolidation of the System. In five hundred years the historians will hardly notice it. There will be the Second Empire—six planets by then."

"Six? You don't honestly think well ever be able to do anything with Jupiter and Saturn? Oh—you mean the Jovian moons."

"No, I mean six primary planets. We'll move Pluto and Neptune in close by the fire and we'll drag Mercury back and let it cool off."

The idea of moving planets startled Don. It sounded wildly impossible, but he let it rest, since his host was a man who maintained that everything and anything was possible. "The race needs a lot of room," Dr. Jefferson went on. "After all, Mars and Venus have their own intelligent races; we can't crowd them much more without genocide—and it's not dead certain which way the genocide would work, even with the Martians. But the reconstruction of this system is just engineering — nothing to what else we'll do. Half a millennium from now there will be more Earthhumans outside this system than in it; we'll be swarming around every G-type star in this neighborhood. Do you know what I would do if I were your age, Don? I'd get me a berth in the Pathfinder."

Don nodded. "I'd like that." The Pathfinder, star ship intended for a one-way trip, had been building on, and near, Luna since before he was born. Soon she would go. All or nearly all of Don's generation had at least dreamed about leaving with her.

"Of course," added his host, "you would have to have a bride." He pointed to the stage which was again filling. "Take that blonde down there. She's a likely looking lassie—healthy at least."

Don smiled and felt worldly. "She might not hanker after pioneering. She looks happy as she is."

"Can't tell till you ask her. Here." Dr. Jefferson summoned the maitre d'hotel; money changed hands. Presently the blonde came to their table but did not sit down. She was a tom-tom singer and she proceeded to boom into Don's ears, with the help of the orchestra, sentiments that would have embarrassed him even if expressed privately. He ceased to feel worldly, felt quite warm in the face instead and confirmed his resolution not to take this female to the stars. Nevertheless he enjoyed it.

The stage was just clearing when the lights blinked once and the sound system again brayed forth: "Space raid warning! Space raid warning!" All lights went out.

III

HUNTED

For an infinitely long moment there was utter blackness and silence without even the muted whir of the blowers. Then a tiny light appeared in the middle of the stage, illuminating the features of the starring comic. He drawled in an intentionally ridiculous nasal voice, "The next sound you hear will be . . . The Tromp of Doom!" He giggled and went on briskly, "Just sit quiet, folks, and hang on to your money—some of the help are relatives of the management. This is just a drill. Anyhow, we have a hundred feet of concrete overhead—and a darn sight thicker mortgage. Now, to get you into the mood for the next act which is mine, the next round of drinks is on the house." He leaned forward and called out, "Gertie! Drag up that stuff we couldn't unload New Year's Eve."

Don felt the tension ease around the room and he himself relaxed. He was doubly startled when a hand closed around his wrist. "Quiet!"

whispered Dr. Jefferson into his ear.

Don let himself be led away in the darkness. The doctor apparently knew, or remembered, the layout; they got out of the room without bumping into tables and with only one unimportant brush with someone in the dark. They seemed to be going down a long hall, black as the inside of coal, then turned a corner and stopped.

"But you can't go out sir," Don heard a voice say. Dr. Jefferson spoke quietly, his words too low to catch. Something rustled; they moved forward again, through a doorway, and turned left.

They proceeded along this tunnel. Don felt sure that it was the public tunnel just outside the restaurant though it seemed to have turned ninety degrees in the dark. Dr. Jefferson still dragged him along by the wrist without speaking. They turned again and went down steps.

There were other people about, though not many. Once someone grabbed Don in the dark; he struck out wildly, smashed his fist into something flabby and heard a muffled grunt. The doctor merely pulled him along the faster.

The doctor stopped at last, seemed to be feeling around in the dark. There came a feminine squeal out of the blackness. The doctor drew back hastily and moved on a few feet, stopped again. "Here," he said at last. "Climb in." He pulled Don forward and placed his hand on something; Don felt around and decided that it was a parked autocab, its top open. He climbed in and Dr. Jefferson got in behind, closing the top after him. "Now we can talk," he said calmly. "Someone beat us to that first one. But we can't go anywhere until the power comes on again."

Don was suddenly aware that he was shaking with excitement. When he could trust himself to speak he said, "Doctor—is this actually an attack?"

"I doubt it mightily," the man answered. "It's almost certainly a drill—I hope. But it gave us just the opportunity that I had been looking for to get away quietly."

Don chewed this over. Jefferson went on, "What are you fretting about? The check? I have an account there."

It had not occurred to Don that they were walking out on the check. He said so and added, "You mean that security policeman I thought I recognized?"

"Unfortunately."

"But— I think I must have made a mistake. Oh, it looked like the same man, all right, but I don't see how it would have been humanly possible for him to have followed me even if he popped into the next cab. I distinctly remember that at least once my cab was the only cab on an elevator. That tears it. If it was the same cop, it was an accident;

he wasn't looking for me."

"Perhaps he was looking for me."

"Huh?"

"Never mind. As to following you—Don, do you know how these autocabs work?"

"Well—in general."

"If that security cop wanted to tail you, he would not get into the next cab. He would call in and report the number of your cab. That number would be monitored in the control-net board at once. Unless you reached your destination before the monitoring started, they would read the code of your destination right out of the machine. Whereupon another security officer would be watching for your arrival. It carries on from there. When I rang for an auto cab my circuit would already be monitored, and the cab that answered the ring likewise. Consequently the first cop was already seated at a table in The Back Room before we arrived. That was their one slip, using a man you had seen but we can forgive that as they are overworked at present.

"But why would they want me? Even if they think I'm uh, disloyal, I'm not that important."

Dr. Jefferson hesitated, then said, "Don, I don't know how long we will be able to talk. We can talk freely for the moment because they are just as limited by the power shutdown as we are. But once the power comes on we can no larger talk and I have a good deal to say. We can't talk, even here, after the power comes on."

"Why not?"

"The public isn't supposed to know, but each of these cabs has a microphone in it. The control frequency for the cab itself can carry speech modulation without interfering with the operation of the vehicle. So we are not safe once power is restored. Yes, I know; it's a shameful set up. I didn't dare talk in the restaurant, even with the orchestra playing. They could have had a shotgun mike trained on us.

"Now, listen carefully. We must locate that package I mailed to you — we must. I want you to deliver it to your father . . . or rather, what's in it. Point number two: you must catch that shuttle rocket tomorrow morning, even if the heavens fall. Point number three: you won't stay with me tonight, after all. I'm sorry but I think it is best so. Number four: when the power comes on, we will ride around for a while, talking of nothing in particular and never mentioning names. Presently I will see to it that we end up near a public common booth and you will call the Caravansary. If the package is there, you will leave me, go back to the Station, get your bags, then go to the hotel, register and pick up your mail. Tomorrow morning you will get your ship and leave. Don't call me. Do you understand all that?"

"Uh, I think so, sir." Don waited, then blurted out, "But why? Maybe I'm talking out of turn, but it seems to me I ought to know why we are doing this."

"What do you want to know?"

"Well . . . what's in the package?"

"You will see. You can open it, examine it, and decide for yourself. If you decide not to deliver it, that's your privilege. As for the rest—what are your political convictions, Don?"

"Why, that's rather hard to say, sir."

"Mmmm—mine weren't too clear at your age either. Let's put it this way: would you be willing to string along with your parents for the time being? Until you form your own?"

"Why, of course!"

"Did it seem a bit odd to you that your mother insisted that you look me up? Don't be shy—I know that a young fellow arriving in the big town doesn't look up semi-strangers through choice. Now—she must have considered it important for you to see me. Eh?"

"I guess she must have."

"Will you let it stand at that? What you don't know, you can't tell—and can't get you into trouble."

Don thought it over. The doctor's words seemed to make sense, yet it went mightily against the grain to be asked to do something mysterious without knowing all the whys and wherefore. On the other hand, had he simply received the package, he undoubtedly would have delivered it to his father without thinking much about it.

He was about to ask further questions when the lights came on and the little car started to purr. Dr. Jefferson said, "Here we go!" leaned over the board and quickly dialed a destination. The autocab moved forward. Don started to speak but the doctor shook his head.

The car threaded its way through several tunnels, down a ramp and stopped in a large underground square. Dr. Jefferson paid it off and led Don through the square and to a passenger elevator. The square was jammed and one could sense the crowd's frenetic mood resulting from the space raid alarm. They had to shove their way through a mass of people gathered around a public telescreen in the center of the square. Don was glad to get on the elevator, even though it too was packed.

Dr. Jefferson's immediate destination was another cab stand in a square several levels higher. They got into a cab and moved away; this one they rode for several minutes, then changed cabs again. Don was completely confused and could not have told whether they were north, south, high, low, east, or west. The doctor glanced at his watch as they left the last autocab and said, "We've killed enough time. Here." He indicated a communication booth near them.

Don went in and phoned the Carvansary. Was there any mail being held for him? No, there was not. He explained that he was not registered at the hotel; the clerk looked again. No, sorry sir.

Don came out and told Dr. Jefferson. The doctor chewed his lip. "Son, I've made a bad error in judgment." He glanced around; there was no one near them. "And I've wasted time."

"Can I help, sir?"

"Eh? Yes, I think you can—I'm sure you can." He paused to think. "We'll go back to my apartment. We must. But we won't stay there. We'll find some other hotel—not the Caravansary—and I'm afraid we must work all night. Are you up to it?"

"Oh, certainly!"

"I've some 'borrowed-time' pills; they'll help. See here Don, whatever happens, you are to catch that ship tomorrow. Understand?"

Don agreed. He intended to catch the ship in any case and could not conceive of a reason for missing it. Privately he was beginning to wonder if Dr. Jefferson were quite right in his head.

"Good. We'll walk; it's not far."

A half-mile of tunnels and a descent by elevator got them there. As they turned into the tunnel in which the doctor's apartment was located, he glanced up and down it; it was empty. They crossed rapidly and the doctor let them in. Two strange men were seated in the living room.

Dr. Jefferson glanced at them, said, "Good evening, gentlemen," and turned back to his guest. "Good night, Don. It's been very pleasant seeing you and be sure to remember me to your parents." He grasped Don's hand and firmly urged him out the door.

The two men stood up. One of them said, "It took you a long time to get home, Doctor."

"I'd forgotten the appointment, gentlemen. Now, goodbye, Don—I don't want you to be late."

The last remark was accompanied by increased pressure on Don's hand. He answered, "Uh, good night, Doctor. And thanks."

He turned to leave, but the man who had spoken moved quickly between him and the door. "Just a moment, please."

Dr. Jefferson answered, "Really, gentlemen, there is no reason to delay this boy. Let him go along so that we may get down to our business."

The man did not answer directly but called out, "Elkins! King!" Two more men appeared from a back room of the apartment. The man who seemed to be in charge said to them, "Take the youngster back to the bedroom. Close the door."

"Come along, buddy."

Don, who had been keeping his mouth shut and trying to sort out the confusing new developments, got angry. He had more than a suspicion that these men were security police even though they were not in uniform, but he had been brought up to believe that honest citizens had nothing to fear. "Wait a minute!" he protested. "I'm not going any place. What's the idea?"

The man who had told him to come along moved closer and took his arm. Don shook it off. The leader stopped any further action by his men with a very slight gesture. "Don Harvey—"

"Huh? Yes?"

"I could give you a number of answers to that. One of them is this—" He displayed a badge in the palm of his hand. "But that might be faked. Or, if I cared to take time, I could satisfy you with stamped pieces of paper, all proper and legalistic and signed with important names." Don noticed that his voice was gentle and cultured.

"But it happens that I am tired and in a hurry and don't want to be bothered playing word games with young punks. So let it stand that there are four of us all armed. So will you go quietly, or would you rather be slapped around a bit and dragged?"

Don was about to answer with school-game bravado; Dr. Jefferson cut in. "Do as they ask you, Donald!"

He closed his mouth and followed the subordinate on back. The man led him into the bedroom and closed the door. "Sit down," he said pleasantly. Don did not move. His guard came up, placed a palm against his chest and pushed. Don sat down.

The man touched a button at the bed's control panel, causing it to lift to the reading position, then lay down. He appeared to go to sleep, but every time Don looked at him the man's eyes met his. Don strained his ears, trying to hear what was going on in the front room, but he need not have bothered; the room, being a sleeping room, was fully soundproof.

So he sat there and fidgeted, trying to make sense out of preposterous things that had happened to him. He recalled almost with unbelief that it had been only this morning that Lazy and he had started out to climb Peddler's Grave. He wondered what Lazy was doing now and whether the greedy little rascal missed him.

Probably not, he admitted mournfully.

He slid a glance at the guard, while wondering whether or not, if he gathered himself together, drawing his feet as far under him as he could—"

The guard shook his head. "Don't do it," he advised.

"Don't to what?"

"Don't try to jump me. You might hurry me and then you might get hurt bad." The man appeared to go back to sleep.

Don slumped into apathy. Even if he did manage to jump this one, slug him maybe, there were three more out front. And suppose he got away from them? A strange city, where they had everything organized, everything under control — where would he run to?

Once he had come across the stable cat playing with a mouse. He had watched for a moment, fascinated even though his sympathies were with the mouse, before he had stepped forward and put the poor beastie out of its misery. The cat had never once let the mouse scamper further than pounce range. Now he was the mouse.

"Up you come!"

Don jumped to his feet, startled and having trouble placing himself. "I wish I had your easy conscience," the guard said admiringly. "It's a real gift to be able to catch forty winks any time. Come on; the boss wants you."

Don preceded him back into the living room; there was no one there but the mate of the man who had guarded him. Don turned and said, "Where is Dr. Jefferson?"

"Never mind," his guard replied. "The lieutenant hates to be kept waiting." He started on out the door.

Don hung back. The second guard casually took him by the arm; he felt a stabbing pain clear to his shoulder and went along.

Outside they had a manually-operated car larger than the robot cabs. The second guard slipped into the driver's seat; the other urged Don into the passenger compartment. There he sat down and started to turn—and found that he could not. He was unable even to raise his hands. Any attempt to move, to do anything other than sit and breathe, felt like struggling against the weight of too many blankets. "Take it easy," the guard advised. "You can pull a ligament fighting that field. And it does not do any good."

Don had to prove to himself that the man was right. Whatever the invisible bonds were, the harder he strained against them the tighter they bound him. On the other hand when he relaxed and rested he could not even feel them. "Where are you taking me?" he demanded.

"Don't you know? The city I.B.I. office, of course."

"What for? I haven't done anything!"

"In that case, you won't have to stay long."

The car pulled up inside a large garaging room; the three got out and waited in front of a door; Don had a feeling that they were being looked over. Shortly the door opened; they went inside.

The place had the odor of bureaucracy. They went down a long corridor past endless offices filled with clerks, desks, transtypers, filing machines, whirring card sorters. A lift bounced them to another level; they went on through more corridors and stopped at an office door. "Inside," said the first guard. Don went in; the door slid shut behind him with the guards outside.

"Sit down, Don." It was the leader of the group of four, now in the uniform of security officer and seated at a horseshoe desk.

Don said, "Where is Dr. Jefferson? What did you do with him?"

"Sit down, I said." Don did not move; the lieutenant went on, "Why make it hard for yourself? You know where you are; you know that I could have you restrained in any way that suited me—some of them quite unpleasant. Will you sit down, please, and save us both trouble?"

Don sat down and immediately said, "I want to see a lawyer."

The lieutenant shook his head slowly, looking like a tired and gentle school teacher. "Young fellow, you've been reading too many romantic novels. Now if you had studied the dynamics of history instead, you would realize that the logic of legalism alternates with the logic of force in a pattern dependent on the characteristics of the culture. Each culture evokes its own basic logic. You follow me?"

Don hesitated; the other went on, "No matter. The point is, your request for a lawyer comes about two hundred years too late to be meaningful. The verbalisms lag behind the facts. Nevertheless, you shall have a lawyer or a lollipop, whichever you prefer, after I am through questioning you. If I were you, I'd take the lollipop. More nourishing.

"I won't talk without a lawyer," Don answered firmly.

"No? I'm sorry. Don, in setting up your interview I budgeted eleven minutes for nonsense. You have used up four already — no, five. When the eleven minutes are gone and you find yourself spitting out teeth, remember that I bore you no malice. Now about this matter of whether or not you will talk; there are several ways of making a man talk and each method has its fans who swear by it. Drugs, for example — nitrous oxide, scopolamine, sodium pentothal, not to mention some of the new, more subtle, and relatively non-toxic developments. Even alcohols have been used with great success by intelligence operatives. I don't like drugs; they affect the intellect and clutter up an interview with data of no use to me. You'd be amazed at the amount of rubbish that can collect in the human brain, Don, if you had had to listen to it —as I have.

"And there is hypnosis and its many variations. There is also the artificial stimulation of an unbearable need, as with morphine addiction. Finally there is old-fashioned force—pain. Why, I know an artist — I believe he is in the building now — who can successfully question the most recalcitrant case, in minimum time and using only his bare hands. Then, of course, under that category, is the extremely ancient switch in which the force, or pain, is not applied to the person being examined but to a second person whom he cannot bear to see hurt, such as a wife, or son, or daughter. Offhand, that method would seem difficult to use on you, as your only close relatives are not on this planet." The security officer glanced at his watch and added, "Only thirty seconds of nonsense still available, Don. Shall we start?"

"Huh? Wait a minute! You used up the time; I've hardly said a word."

"I haven't time to be fair. Sorry. However," he went on, "the apparent objection to the last method does not apply in your case. During the short time you were unconscious at Dr. Jefferson's apartment we were able to determine that there actually was available a person who meets the requirements. You will talk freely rather than let this person be hurt."

"Huh?"

"A stock pony named 'Lazy.' "

The suggestion caught him completely off guard; he was stunned by it. The man went quickly on, "If you insist, we will adjourn for three hours or so and I will have your horse shipped here. It might be interesting, as I don't believe the method has ever been used with a horse before. I understand that their ears are rather sensitive. On the other hand I feel bound to tell you that, if we go to the trouble of bringing him here, we won't send him back but will simply send him to the stockyards to be butchered. Horses are an anachronism in New Chicago, don't you think?"

Don's head was whirling too much to make a proper answer, or even to follow all of the horrid implications of the comments. Finally he burst out, "You can't! You wouldn't!"

"Time's up, Don."

Don took a deep breath, collapsed. "Go ahead," he said dully. "Ask your questions."

The lieutenant took a film spool from his desk, fed it into a projector which faced back toward him. "Your name, please."

"Donald James Harvey."

"And your Venerian name?"

Don whistled "Mist on the Waters."

"Where were you born?"

"In the Outward Bound, in trajectory between Luna and Ganymede." The questions went on and on. Don's inquisitor appeared to have all the answers already displayed in front of him; once or twice he had Don elaborate or corrected him on some minor point. After reviewing his entire past life he required Don to give a detailed account of the events starting with his receiving the message from his parents to take passage on the Valkyrie for Mars.

The only thing Don left out was Dr. Jefferson's remarks about the package. He waited nervously, expecting to be hauled up short about it. But if the security policeman knew of the package, he gave no sign of it. "Dr. Jefferson seemed to think that this so-called security operative was following you? Or him?"

"I don't know. I don't think he knew."

" 'The wicked flee when no man pursueth,' " the lieutenant quoted. "Tell me exactly what you did after you left The Back Room."

"Was that man following me?" Don asked. "So help me, I had never laid eyes on that dragon before; I was just passing the time of day, being polite."

"I'm sure you were. But I'll ask the questions. Go ahead."

"Well, we changed cabs twice—or maybe three times. I don't know just where we went; I don't know the city and was all turned around. But eventually we came back to Dr. Jefferson's apartment." He omitted mention of the call to the Caravansary; again, if his questioner was aware of the omission, he gave no sign of it.

The lieutenant said, "Well, that seems to bring us up to date." He switched off the projector and sat staring at nothing for some minutes. "Son, there is no doubt in my mind but what you are potentially disloyal."

"Why do you say that?"

"Never mind the guff. There's nothing in your background to make you loyal. But that is nothing to get excited about; a person in my position has to be practical. You are planning to leave for Mars tomorrow morning?"

"I sure am."

"Good. I don't see how you could have been up to much mischief at your age, isolated as you were out on that ranch. But you fell into bad company. Don't miss that ship; if you are still here tomorrow I might have to revise my opinions."

The lieutenant stood up and so did Don. "I'll certainly catch it!" Don agreed, then stopped. "Unless—"

"Unless what?" the lieutenant said sharply.

"Well, they held up my ticket for security clearance," Don blurted out.

"They did, eh? A routine matter; I'll take care of it. You can leave now. Open sky!"

Don did not make the conventional answer. The man said, "Don't be sulky. It would have been simpler to have beaten the living daylights out of you, then questioned you. But I didn't; I have a son about your age myself. And I never intended to hurt your horse—happens I like horses; I'm a country boy originally. No hard feelings?"

"Uh, I guess not."

The lieutenant put out his hand; Don found himself accepting it — he even found himself liking the man. He decided to chance one more question. "Could I say goodbye to Dr. Jefferson?"

The man's expression changed. "I'm afraid not."

"Why not? You'd be watching me, wouldn't you?"

The officer hesitated. "There's no reason why you shouldn't know. Dr. Jefferson was a man in very poor health. He got excited, suffered an attack and died of heart failure, earlier tonight."

Don simply stared. "Brace up!" the man said sharply. "It happens to all of us." He pressed a button on his desk a guard came in and was told to take Don out. He was led out by another route but he was too bemused to notice it. Dr. Jefferson dead? It did not seem possible. A man so alive, so obviously in love with life. He was dumped out into a major public tunnel while still thinking about it.

Suddenly he recalled a phrase he had heard in class from his biology teacher, " 'In the end, all forms of death can be classed as heart failure.' " Don held up his right hand, stared at it. He would wash it as quickly as he could.

IV

THE GLORY ROAD

He still had things to do; he could not stand there all night. First, he supposed that he had better go back to the station and pick up his bags. He fumbled in his pouch for his claim check while he worried about just how he would get there; he still did not have hard money with which to pay off an autocab.

He failed to find the claim check. Presently he removed everything from the pouch. Everything else was there; his letter of credit; his identification card, the messages from his parents, a flat photo of Lazy, his birth certificate, odds and ends—but no claim check. He remembered putting it there.

He thought of going back into the I.B.I. warren; he was quite sure now that it must have been taken from him while he slept. Darn funny, him falling asleep like that, at such a time. Had they drugged him? He decided against going back.

Not only did he not know the name of the officer who had questioned him, nor any other way of identifying him, but more importantly he would not have done back into that place for all the baggage in Gary Station. Let it go, let it go — he'd pick up more socks and shorts before blast off!

He decided instead to go to the Caravansary. First he had to find out where it was; he walked slowly along, looking for someone who did not seem too busy nor too important to ask. He found him in the person of a lottery ticket vendor at the next intersection.

The vendor looked him over. "You don't want to go to that place, Mac. I can fix you up with something really good." He winked.

Don insisted that he knew what he wanted. The man shrugged. "Okay, chump. Straight ahead until you come to a square with an electric fountain in it, then take the slidewalk south. Ask anybody where to get off. What month were you born?"

"July."

"July! Boy, are you lucky—I've just got one ticket left with your horoscope combination. Here." Don had no intention at all of buying it and he thought of telling the grifter that he considered horoscopes as silly as spectacles on a cow—but he found that he had purchased it with his last coin. He pocketed the ticket, feeling foolish. The vendor said, "About half a mile on the slidewalk. Brush the hay out of your hair before you go in."

Don found the slidewalk without difficulty and discovered that it was a pay-as-you-enter express. The machine not being interested in lottery tickets he walked the catwalk alongside it to the hotel. He had no trouble finding it; its brilliantly lighted entrance spread for a hundred yards along the tunnel.

No one seemed to help him as he came in. He went to the reservation desk and asked for a room. The clerk looked him over doubtfully. "Did someone take care of your baggage, sir?"

Don explained that he had none. "Well . . . that will be twentytwo fifty, in advance. Sign here, please."

Don signed and stamped his thumb print, then got out his father's letter of credit. "Can I get this cashed?"

"How much is it?" The clerk took it, then said, "Certainly, sir. Let me have your ID, please." Don passed it over. The clerk took it and the fresh thumb print, placed both in a comparison machine. The machine beeped agreement; the clerk handed back the card. "You are you, all right." He counted out the money, deducting the room charge. "Will your baggage be along, sir?" His manner indicated that Don's social status had jumped.

"Uh, no, but there might be some mail for me." Don explained that he was going out on the Glory Road in the morning.

"I'll query the mail room."

The answer was no; Don looked disappointed. The clerk said, "I'll have the mail room flag your name. If anything arrives before upship, you'll be sure to get it—even if we have to send a messenger to the field."

"Thanks a lot."

"Not at all. Front!" As he let himself be led away, Don suddenly realized that he was groggy. The big foyer clock told him that it was already tomorrow, had been for hours in fact — he was paying seven-fifty an hour, about, for the privilege of a bed, but the way he felt he would have paid more than that simply to crawl into a hole.

He did not go immediately to bed. The Caravansary was a luxury hotel; even its "cheap" rooms had the minimums of civilized living. He adjusted the bath for a cycling hot sitz, threw off his clothes, and let the foaming water soothe him. After a bit he changed the pattern and floated in tepid stillness.

He came to with a start and got out. Ten minutes later, dried, powdered, and tingling with massage, he stepped back into the bedroom feeling almost restored. The ranch school had been intentionally monastic, oldstyle beds and mere showers; that bath was worth the price of the room.

The delivery chute's annunciator shone green; he opened it and found three items. The first was a largish package sealed in plastic and marked "CARAVANSARY COURTESY KIT"; it contained a comb and toothbrush, a sleeping pill, a headache powder, a story film for the bed's ceiling projector, a New Chicago News, and a breakfast menu. The second item was a card from his roommate; the third item was a small package, a common mailing tube. The card read: Dear Don, A package came for you on the P.M. I got the Head to let me run it into Alb-Q-Q. Squinty is taking over Lazy. Must sign off; I've got to land this heap. All the best, Jack.

Good old Jack, he said to himself, and picked up the mailing tube. He looked at the return address and realized with something of a shock that this must be the package over which Dr. Jefferson had been so much concerned, the package which apparently had led to his death. He stared at it and wondered if it could be true that a citizen could he dragged out of his own home, then so maltreated that he died.

Was the man he had had dinner with only hours ago really dead? Or had the security cop lied to him for some reason of his own?

Part of it was certainly true; he had seen them waiting to arrest the doctor—why, he himself had been arrested and threatened and questioned, and had had his baggage virtually stolen from him, for nothing! He hadn't been doing a thing, not a confounded thing, just going about his lawful business.

Suddenly he was shaking with anger. He had let himself be pushed around; he made a solemn vow never to let it happen again. He could see now that there were half a dozen places where he should have been stubborn. If he had fought right at the outset, Dr. Jefferson might be alive — if he actually were dead, he amended.

But he had let himself be bulldozed by the odds against him. He promised himself never again to pay any attention to the odds, but only to the issues.

He controlled his trembling and opened the package.

A moment later he was looking baffled. The tube contained nothing but a man's ring, a cheap plastic affair such as one might find on any souvenir counter. An old English capital "H" framed with a circle had been pressed into the face of it and the grooves filled with white enamel. It was flashy but commonplace and of no value at all to any but the childish and vulgar in taste.

Don turned it over and over, then put it aside and sorted through its wrappings. There was nothing else, not even a message, just plain white paper used to pack the ring. Don thought it over.

The ring obviously was not the cause of the excitement; it seemed to him that there were just two possibilities: first, that the security police had switched packages — if they had, there was probably nothing he could do about it — and second, if the ring were unimportant but it was the right package, then the rest of the contents of the package must be important even though it looked like nothing but blank paper.

The idea that he might be carrying a message in invisible ink excited him and he started thinking of ways to bring out the message. Heat? Chemical reagents? Radiation? Even as he considered it he realized regretfully that, supposing there were such a message, it was not his place to try to make it legible; he was simply to deliver it to his father.

He decided, too, that it was more likely that this was a dummy package sent along by the police. He had no way of telling what they might have forced out of Dr. Jefferson. Which reminded him that there was still one thing he could do to check up, futile as it probably would be; he stepped to the phone and asked for Dr. Jefferson's residence. True, the doctor had told him not to phone—but the circumstances had changed.

He had to wait a bit, then the screen lighted up—and he found himself staring into the face of the security police lieutenant who had grilled him. The police officer stared back. "Oh, me!" he said in a tired voice, "so you didn't believe me? Go back to bed; you have to be up in an hour or so."

Don switched off without saying anything.

So Dr. Jefferson was either dead or still in the hands of the police. Very well; he would assume that the paper came from the doctor — and he would deliver that paper in spite of all the slimily polite stormtroopers New Chicago could muster! The dodge the doctor had apparently used to fake the purpose of the paper caused him to wonder what he could do to cover up its importance. Presently he got his stylus from his pouch, smoothed out the paper, and started a letter. The paper looked enough like writing paper to make a letter on it seem reasonable—it might be writing paper in truth. He started in "Dear Mother and Dad, I got your radiogram this morning and was I excited!" He continued, simply covering space in a sprawling hand and finishing, when he was about to run out of paper, by mentioning an intention to add to the letter and have the whole thing sent off as soon as his ship was in radio range of Mars. He then folded it, tucked it into his wallet, and put the whole into his pouch.

He looked at the clock as he finished. Good heavens! He should be up in an hour; it was hardly worthwhile going to bed. But his eyes were trying to close even as he thought it; he saw that the alarm dial of the bed was graduated from "Gentle Reminder" to "Earthquake"; he picked the extreme setting and crawled in.

He was being bounced around, a blinding light was flashing in his eyes, and a siren was running up and down the scale. Don gradually became aware of himself, scrambled out of bed. Mollified, the bed ceased its uproar.

He decided against breakfast in his room for fear that he might go back to sleep, choosing instead to stumble into his clothes and seek out the hotel's coffee shop. Four cups of coffee and a solid meal later, checked out and armed with hard money for an autocab, he headed for Gary Station. At the reservation office of Interplanet Lines he asked for his ticket. A strange clerk hunted around, then said, "I don't see it. It's not with the security clearances."

This, Don thought, is the last straw. "Look around. It's bound to be there"

"But it's— Wait a moment!" The clerk picked up a slip. "Donald James Harvey? You're to pick up your ticket in room 4012, on the mezzanine."

"Why?"

"Search me; I just work here. That's what it says."

Mystified and annoyed, Don sought out the room named. The door was plain except for a notice "Walk In"; he did and found himself again facing the security lieutenant of the night before.

The officer looked up from a desk. "Get that sour look off your puss, Don," he snapped. "I haven't had much sleep either."

"What do you want of me?"

"Take off your clothes."

"Why?"

"Because we are going to search you. You didn't really think I'd let you take off without it, did you?"

Don planted his feet. "I've had just about enough pushing around," he said slowly. "If you want my clothes off you'll have to do it."

The police officer scowled. "I could give you a couple of convincing answers to that, but I am fresh out of patience. Kelly, Arteem. Strip him."

Three minutes later Don had an incipient black eye and was nursing a damaged arm. He decided that it was not broken, after all. The lieutenant and his assistants had disappeared into a rear room with his clothing and pouch. It occurred to him that the door behind him did not seem to be locked, but he dropped the idea; making a dash for ii through Gary Station in his skin did not appear to make sense.

Despite the inevitable defeat his morale was better than it had been in hours.

The lieutenant returned presently and shoved his clothes at him. "Here you are. And here's your ticket. You may want to put on clean clothes; your bags are back of the desk."

Don accepted them silently, ignored the suggestion about a change in order to save time. While he was dressing the lieutenant said suddenly, "When did you pick up that ring?"

"Forwarded to me from school."

"Let me see it."

Don took it off and flung it at him. "Keep it, you thief!"

The lieutenant caught it and said mildly, "Now, Don, it's nothing personal." He looked the ring over carefully, then said, "Catch!" Don caught it and put it back on, picked up his bags and started to leave. "Open sky," said the lieutenant.

Don ignored him.

" 'Open sky,' I said!"

Don turned again, looked him in the eye and said, "Some day I hope to meet you socially." He went on out. They had spotted the paper after all; he had noticed that it was missing when he got back his clothes and pouch.

This time he took the precaution of getting an antinausea shot before upship. After he had stood in line for that he had barely time to be weighed in before the warning signal. As he was about to get into the elevator he saw what he believed to be a familiar figure lumbering onto the cargo lift nearby—"Sir Isaac Newton." At least it looked like his passing acquaintance of the day before, though he had to admit that the difference in appearance between one dragon and another was sometimes a bit subtle for the human eye.

He refrained from whistling a greeting; the events of the past few hours had rendered him less naive and more cautious. He thought about those events as the elevator mounted up the ship's side. It was unbelievably only twenty-four hours, less in fact, since he had gotten that radio message. It seemed like a month and he himself felt aged ten years.

Bitterly he reflected that they had outwitted him after all. Whatever message lay concealed in that wrapping paper was now gone for good. Or bad.

Couch 64 in the Glory Road was one of a scant half dozen on the third deck; the compartment was almost empty and there were marks on the deck where other couches had been unbolted. Don found his place and strapped his bags to the rack at its foot. While he was doing so he heard a rich Cockney voice behind him; he turned and whistled a greeting.

"Sir Isaac Newton" was being cautiously introduced into the compartment from the cargo hold below with the help of about six spaceport hands. He whistled back a courteous answer while continuing to supervise the engineering feat via voder. "Easy, friends, easy does it! Now if two of you will be so kind as to place my left midship foot on the ladder, bearing in mind that I cannot see it — Wups! Mind your fingers. There, I think I can make it now. Is there anything breakable in the way of my tail?"

The boss stevedore answered, "All clear, chief. Upsy-daisy!"

"If you mean what I think you mean," answered the Venerian, "then, 'On your mark; get set—GO!' " There was a crunching metallic sound, a tinkle of breaking glass, and the huge saurian scrambled up out of the hatch. Once there he turned cautiously around and settled himself in the space left vacant for him. The spaceport hands followed him and secured him to the deck with steel straps. He waggled an eye at the straw boss. "You, I take it, are the chieftain of this band?"

"I'm in charge."

The Venerian's tendrils quitted the keys of the voder, sought out a pouch by it, and removed a sheaf of paper money. He laid it on the deck and returned to the keys. "Then, sir, will you favor me by accepting this evidence of my gratitude for a difficult service well performed and distribute it among your assistants equitably and according to your customs, whatever they may be?"

The human scooped it up and shoved it into his pouch. "Sure thing, chief. Thanks."

"The honor is mine." The laborers left and the dragon turned his attention to Don, but, before they could exchange any words, the last of the compartment's human freight came down from the deck above.

It was a family party; the female head thereof took one look inside and screamed.

She swarmed back up the ladder, causing a traffic jam with her descendants and spouse as she did so. The dragon swiveled two eyes in her direction while waving the others at Don. "Dear me!" he keyed. "Do you think it would help if I were to assure the lady that I have no anthropophagic tendencies?"

Don felt acutely embarrassed; he wished for some way to disown the woman as a blood sister and member of his race. "She's just a stupid fool," he answered. "Please don't pay any attention to her."

"I fear me that a merely negative approach will not suffice."

Don whistled an untranslatable dragon sound of contempt and continued with "May her life be long and tedious."

"Tut, tut," the dragon tapped back. "Unreasoned anguish is nonetheless real. 'To understand all is to forgive all'—one of your philosophers."

Don did not recognize the quotation and it seemed pretty extreme to him, in any case. He was sure that there were things he would never forgive no matter how well he understood them—some recent events, in fact. He was about to say so when both their attentions were arrested by sounds pouring down the open hatchway. Two and perhaps more male voices were engaged in an argument with a shrill female voice rising over them and sometimes drowning them out. It appeared (a) that she wanted to speak to the captain (b) that she had been carefully brought up and had never had to put up with such things (c) that those hideous monsters should never be allowed to come to Earth; they should be exterminated (d) that if Adolf were half a man he wouldn't just stand there and let his own wife be treated so (e) she intended to write to the company and that her family was not without influence and (f) that she demanded to speak to the captain.

Don wanted to say something to cover it up but he was fascinated by it. Presently the sounds moved away and died out; a ship's officer came down the hatch and looked around. "Are you comfortable?" he said to "Sir Isaac Newton."

"Quite, thank you."

He turned to Don. "Get your bags, young man, and come with me. The captain has decided to give his nibs here a compartment to himself."

"Why?" asked Don. "My ticket says couch sixty-four and I like it here."

The ship's officer scratched his chin and looked at him, then turned to the Venerian. "Is it all right with you?"

"Most certainly. I shall be honored by the young gentleman's company."

He turned back to Don. "Well . . . all right. I'd probably have to hang you on a hook if I moved you anyway." He glanced at his watch and swore. "If I don't get a move on, we'll miss takeoff and have to lay over a day." He was up and out of the compartment as he spoke.

The final warning sounded over the announcing system; a hoarse voice followed it with, "All hands! Strap down! Stand by for lift!" The order was followed by a transcription of the brassy strains of Le Compte's, Raise Ship! Don's pulse quickened; excitement mounted in him. He felt ecstatically happy, eager to be back in space again, back where he belonged. The bad, confusing things of the past day washed out of his mind; even the ranch and Lazy grew dim.

So timed was the transcribed music that the rocket-blast effect of the final chorus merged into the real blast of the ship's tubes; the Glory Road stirred and lifted . . . then threw herself away into the open sky.

V

CIRCUM TERRA

The weight of acceleration was no worse than it had been the day before in the Santa Fe Trail but the drive persisted for more than five minutes, minutes that seemed like an endless hour. After they passed the speed of sound the compartment was relatively quiet. Don made a great effort and managed to turn his head a little. "Sir Isaac Newton's" great bulk was flattened to the deck, making Don think unpleasantly of a lizard crushed into a road. His eyestalks drooped like limp asparagus. He looked dead.

Don strained for breath and called out, "Are you all right?"

The Venerian did not stir. His voder instrument was covered by the sagging folds of his neck; it seemed unlikely that his tendrils could have managed the delicate touch required for its keys even had it been free. Nor did he reply in his own whistling speech.

Don wanted to go to him, but he was as immobilized by the blast weight as is the bottommost player in a football pile up. He forced his head back where it belonged a so that he might breathe less painfully and waited.

When the blast died away his stomach gave one protesting flipflop, then quieted down; either the antinausea shot had worked or he had his space balance again—or both. Without waiting for permission from the control room he quickly unstrapped and hurried to the Venerian. He steadied himself in the air, holding with one hand to the steel bands restraining his companion.

The dragon was no longer crushed to the deck plates; only the steel hoops kept him from floating around the compartment. Behind him his giant tail waved loosely, brushing the ship's plates and knocking off paint chips.

The eyestalks were still limp and each eye filmed over. The dragon stirred only in the meaningless motion of string in water; there was nothing to show that he was alive. Don clenched a fist and pounded on the creature's flat skull. "Can you hear me? Are you all right?"

All he got out of it was a bruised hand; Sir Isaac made no response. Don hung for a moment, wondering what to do. That his acquaintance was in a bad way he felt sure, but his training in first aid did not extend to Venerian pseudosaurians. He dug back into his childhood memories, trying to think of something.

The same ship's officer who had rearranged the berthing appeared at the forward or "upper" hatch, floating head "down." "All okay this deck?" he inquired perfunctorily and started to back out.

"No!" Don shouted. "Case of blast shock."

"Huh?" The officer swam on into the compartment and looked at the other passenger. He swore unimaginatively and looked worried. "This is beyond me; I never carried one before. How the deuce do you give artificial respiration to a thing as big as that?"

"You don't," Don told him. "His lungs are completely enclosed in his armor box."

"He looks dead. I think he's stopped breathing."

A memory floated to the top in Don's mind; he snatched it. "Got a cigarette?"

"Huh? Don't bother me! Anyhow the smoking lamp is out."

"You don't understand," Don persisted. "If you've got one, light it. You can blow smoke at his nostril plate and see whether or not he's breathing."

"Oh. Well, maybe it's a good idea." The spaceman got out a cigarette and struck it.

"But be careful," Don went on. "They can't stand nicotine. One big puff and then put it out."

"Maybe it's not such a good idea," the ship's officer objected. "Say, you sound like a Venus colonial?"

Don hesitated, then answered, "I'm a Federation citizen." It seemed like a poor time to discuss politics. He moved over to the dragon's chin, braced his feet against the deck plates and shoved, thus exposing the Venerian's nostril plate, which was located under the creature's head in the folds of his neck. Don could not have managed it, save that they were in free fall, making the bulky mass weightless.

The man blew smoke at the exposed opening. It eddied forward, then some of it curled inside; the dragon was still alive.

Still very much alive. Every eyestalk sprang to rigid attention; he lifted his chin, carrying Don with it, then he sneezed. The blast struck Don where he floated loosely and turned him over and over. He threshed in the air for a moment before catching a handhold on the hatch ladder.

The ship's officer was rubbing one wrist. "The beggar clipped me," he complained. "I won't try that again soon. Well, I guess he'll be all right."

Sir Isaac whistled mournfully; Don answered him. The spaceman looked at him. "You savvy that stuff?"

"Some."

"Well, tell him to use his squawk box. I don't!"

Don said, "Sir Isaac—use your voder." The Venerian tried to comply. His tentacles hunted around, found the keys of the artificial voice box, and touched them. No sounds came out. The dragon turned an eye at Don and whistled a series of phrases.

"He regrets to say that its spirit has departed," Don interpreted.

The ship's officer sighed. "I wonder why I ever left the grocery business? Well, if we can get it unlatched from him, I'll see if 'Sparks' can fix it."

"Let me," said Don and squirmed into the space between the dragon's head and the deck plates. The voder case, he found, was secured to four rings riveted to the Venerian's skin plates. He could not seem to find the combination; the dragon's tendrils fluttered over his hands, moved them gently out of the way, unfastened the box, and handed it to him. He wiggled out and gave it to the man. "Looks like he kind of slept on it," he commented.

"A mess," the other agreed. "Well, tell him I'll have them fix it if possible and that I'm glad he wasn't hurt."

"Tell him yourself; he understands English."

"Eh? Oh, of course, of course." He faced the Venerian who immediately set up a long shrilling. "What's he say?"

Don listened. "He says he appreciates your good wishes but that he is sorry to have to disagree; he is unwell. He says that he urgently requires" Don stopped and looked puzzled, then whistled the Venerian equivalent of "Say that again, please?"

Sir Isaac answered him; Don went on, "He says he's just got to have some sugar syrup."

"Huh?"

"That's what he says."

"I'll be — How much?"

There was another exchange of whistles; Don answered, —Uh, he says he needs at least a quarter of a—there isn't any word for it; it's an amount about equal to half a barrel, I'd say."

"You mean he wants half a barrel of waffle juice?"

"No, no, a quarter of that—an eighth of a barrel. What would that come to in gallons?"

"I wouldn't attempt it without a slipstick; I'm confused. I don't even know that we have any on board." Sir Isaac set up more frantic whistling. "But if we don't, I'll have the cook whip up some. Tell him to hold everything and take it easy." He scowled at the dragon, then left quite suddenly.

Don attached himself to one of the steel straps and asked, "How are you feeling now?"

The dragon replied apologetically to the effect that he needed to return to the egg for the moment. Don shut up and waited.

The captain himself showed up to attend the sick passenger. The ship, being in free trajectory for the satellite space station, would not require his presence in the control room until well past noon, New Chicago time; he was free to move around the ship. He arrived in company with the ship's doctor and followed by a man herding a metal tank.

The two conferred over the dragon, at first ignoring Don's presence. However neither of them knew the piping speech of the dragon tribe; they were forced to turn to Don. Through him Sir Isaac again insisted that he required sugar solution, as a stimulant. The captain looked worried. "I've read somewhere that sugar gets them drunk the same as alcohol does us."

Don again translated for the Venerian; what he had asked for was simply a medicinal dose.

The captain turned to the medical officer. "How about it, surgeon?"

The doctor stared at the bulkhead. "Captain, this is as far outside my duties as tap dancing."

"Confound it, man, I asked for your official opinion!"

The medical officer faced him. "Very well, sir—I would say that if this passenger should die, you having refused him something he had asked for, it would look very, very bad indeed."

The captain bit his lip. "As you say, sir. But I'll be switched if I want several tons of intoxicated dragon banging around in my ship. Administer the dose."

"Me, sir?"

"You, sir."

The ship being in free fall it was quite impossible to pour out the syrup and let the Venerian lick it up, nor was he physically equipped to use the "baby bottle" drinking bladder used by humans when weightless. But that had been anticipated; the tank containing the syrup was a type used in the galley to handle soup or coffee in free fall. It had a hand pump and an attachable hose.

It was decided, Sir Isaac concurring, to place the end of the hose well down the dragon's throat. But nobody seemed to want the job. Granted that Draco Veneris Wilsonii is a civilized race, to stick one's head and shoulders between those rows of teeth seemed to be inviting a breach in foreign relations.

Don volunteered for the job and was sorry when they took him up on it. He trusted Sir Isaac but recalled times when Lazy had stepped on his foot quite unintentionally. He hoped that the dragon had no unfortunate involuntary reflexes; apologies are no use to a corpse.

While he kept the end of the hose firmly in place he held his breath and was glad that he had taken that antinausea injection. Sir Isaac did not have halitosis, as dragons go, but dragons go rather far in that direction. The job done, he was happy to back out.

Sir Isaac thanked them all, via Don, and assured them that he would now recover rapidly. He seemed to fall asleep in the midst of whistling. The ship's doctor peeled one eyestalk and shined a hand torch at it. "The stuff has hit him, I think. We'll let him be and hope for the best."

They all left. Don looked his friend over, decided that there was no point in sitting up with him, and followed them. The compartment had no view port; he wanted at least one good look at Earth while they were still close by. He found what he sought three decks forward.

They were still only fifteen thousand miles out; Don had to crowd in close to the view port to see all of Earth at one time. It was, he had to admit, a mighty pretty planet; he was a little bit sorry to be leaving it. Hanging there against velvet black and pinpoint stars, drenched in sunlight so bright it hurt your eyes, it almost took your breath away.

The sunrise line had swung far into the Pacific past Hawaii, and North America was spread out to his gaze. Storm blanketed the Pacific Northwest, but the Midwest was fairly clear and the Southwest was sharp. He could make out where New Chicago was with ease; he could see the' Grand Can on and from it he could almost figure out where the range had to be. He was sure that with a small telescope he could have spotted it.

He gave up his place at last. He was soaking in the pleasant melancholy of mild homesickness and the comments of some of the other passengers were beginning to annoy him, not the cheerful inanities of tourists but the know-it-all remarks of self-appointed old timers, making their second trip out. He headed back to his own compartment.

He was startled to hear his name called. He turned and the ship's officer he bad met before floated up to him. He had with him Sir Isaac's voder. "You seem to be chummy with that overeducated crocodile you're bunking with; how about taking this to him?"

"Why, certainly."

"The radio officer says it needs an overhaul but at least it's working again." Don accepted it and went aft. The dragon seemed to be sleeping, then one eye waved at him and Sir Isaac whistled a salutation.

"I've got your voice box," Don told him. "Want me to fasten it on for you?"

Sir Isaac politely refused. Don handed the instrument to the fidgeting tendrils and the dragon arranged it to suit him. He then ran over the keys as a check, producing sounds like frightened ducks. Satisfied, he began to speak in English: "I am enriched by the debt you have placed upon me."

"It was nothing," Don answered. "I ran into the mate a couple of decks forward and be asked me to fetch it along."

"I do not refer to this artificial voice, but to your ready help when I was in distress and peril. Without your quick wit, your willingness to share mud with an untested stranger, and in passing your knowledge of the true speech, I might have lost my chance to attain the happy death."

"Shucks," Don answered, feeling somewhat pink, "it was a pleasure." He noticed that the dragon's speech was slow and somewhat slurred, as if his tentacles lacked their customary dexterity. Besides that, Sir Isaac's talk was more a pedantic than ever and much more Cockney-flavored—the voder was mixing aspirates with abandon and turning the theta sound into "f"; Don felt sure that the Earthman who had taught him to speak must have been born in earshot of Bow Bells.

He noticed as well that his friend could not seem to make up his mind which eye he wanted to use on him. He kept waggling one after another at Don, as if seeking one which would let him focus better. Don wondered if Sir Isaac had overestimated the proper size of a medicinal dose.

"Permit me," the Venerian went on, still with ponderous dignity, "to judge the worth of the service you have done me." He changed the subject. "This word 'shucks'—I do not recognize the use you made of it. Husks of plants?"

Don struggled to explain how little and how much "shucks" could mean. The dragon thought it over and tapped out an answer. "I believe that I gain a portion of understanding. The semantic content of this word is emotional and variable, rather than orderly and descriptive. Its referent is the state of one's spirits?"

"That's it," Don said happily. "It means just what you want it to mean. It's the way you say it."

"Shucks," the dragon said experimentally. "Shucks. I seem to be getting the feel of it. A delightful word. Shucks." He went on, "The delicate nuances of speech must be learned from the living users thereof. Perhaps I may return the favor by helping you in some small wise with your already great mastery of the speech of my people? Shucks."

This confirmed Don's suspicion that his own whistling had become so villainous that it might do for popcorn vending but not for regular communication. "I certainly would appreciate a chance to brush up," he answered. "I haven't had a chance to speak 'true speech' for years—not since I was a kid. I was taught by a historian who was working with my father on the (whistled) ruins. Perhaps you know him? His name was 'Professor Charles Darwin.' " Don added the whistled or true version of the Venerian scholar's name.

"You ask me if I know (whistled)? He is my brother; his grandmother, nine times removed, and my grandmother, seven times removed, were the same egg. Shucks!" He added, "A learned person, for one so young."

Don was a bit taken aback to hear "Professor Darwin" described as "young"; as a child he had classed him and the ruins as being about the same age. He now had to remind himself that Sir Isaac might see it differently. "Say that's nice!" he answered. "I wonder if you knew my parents? Dr. Jonas Harvey and Dr. Cynthia Harvey?"

The dragon turned all eyes on him. "You are their egg? I have not had the honor of meeting them but all civilized persons know of them and their work. I am no longer surprised at your own excellence. Shucks!"

Don felt both embarrassment and pleasure. Not knowing what to say he suggested that Sir Isaac coach him for a while in "true speech," a suggestion to which the dragon readily assented. They were still so engaged when the warning signal sounded and a voice from the control room sang, out, "Strap down for acceleration! Prepare to match trajectories!"

Don placed his hands against his friend's armored sides and shoved himself back to his couch. He paused there and said, "Are you going to be all right?"

The dragon made a sound which Don construed as a hiccup cup, and tapped out, "I feel sure of it. This time I am fortified."

"I hope so. Say, you don't want to bung up your voder again. Want me to take care of it?"

"If you will, please."

Don went back and got it, then fastened it to his bags. He had barely time to fasten his safety belts when the first surge of acceleration hit them. It was not so bad, this time, neither as many gravities as the blastoff from Earth nor of as long duration, for they were not breaking free of Earth's crushing grip but merely adjusting trajectories—modifying the outer end of the Glory Roads elliptical path to make it agree perfectly with the circular orbit of Circum-Terra, the crossroads station in space which was their destination.

The captain gave them one long powerful shove, waited, then blasted twice more for short intervals, without, Don noted, finding it necessary to invert and blast back. He nodded approval. Good piloting! — the captain knew his vectors. The bullhorn sang out, "Contact! Unstrap at will. Prepare to disembark."

Don returned the voder to Sir Isaac, then lost track of him, for the dragon again had to be taken aft to be transferred through the cargo hatch. Don whistled goodbye and went forward, towing his bags behind him, to go out through the passenger tube.

Circum-Terra was a great, confused mass in the sky. It had been built, rebuilt, added to, and modified over the course of years for a dozen different purposes—weather observation station, astronomical observatory, meteor count station, television relay, guided missile control station, high vacuum, strain-free physics laboratory, strain-free germ-free biological experiment station, and many other uses.

But most importantly it was a freight and passenger transfer station in space, the place where short-range winged rockets from Earth met the space liners that plied between the planets. For this purpose it had fueling tanks, machine shops, repair cages that could receive the largest liners and the smallest rockets and a spinning, pressurized drum — "Goddard Hotel"—which provided artificial gravity and Earth atmosphere for passengers and for the permanent staff of Circum-Terra.

Goddard Hotel stuck out from the side of Circum-Terra like a cartwheel from a pile of junk. The hub on which it turned ran through its center and protruded out into space. It was to this hub that a ship would couple its passenger tube when discharging or loading humans. That done, the ship would then be warped over to a cargo port in the non-spinning major body of the station. When the Glory Road made contact, there were three other ships in at Circum-Terra: the Valkyrie in which Don Harvey had passage for Mars, the Nautilus, just in from Venus and in which Sir Isaac expected to return home, and the Spring Tide, the Luna shuttle which alternated with its sister the Near Tide.

The two liners and the moon ship were already tied up to the main body of the station; the Glory Road warped in at the hub of the hotel and immediately began to discharge passengers. Don waited his turn and then pulled himself along by handholds, dragging his bags behind him, and soon found himself inside the hotel, but still in weightless free fall in the cylindrical hub of the Goddard.

A man in overalls directed Don and the dozen passengers he was with to a point halfway along the hub where a large lift blocked further progress. Its circular door stood open and turned very slowly around, moving with the spinning hotel proper. "Get in," he ordered. "Mind you get your feet pointed toward the floor."

Don got in with the others and found that the inside of the car was cubical. One wall was marked in big letters: FLOOR. Don found a handhold and steadied himself so that his feet would be on the floor when weight was applied. The man got in and started the car out toward the rim.

There was no feeling of weight at first, at least not toward the "floor." Don experienced a dizzy sensation as increasing spin sloshed the liquid about in his inner ear. He knew that he had ridden this elevator before, when he was eleven and heading for Earth and school, but he had forgotten its unpleasant aspects.

Soon the elevator stopped; the floor became the floor in earnest, though with considerably less than one gravity, and the upsetting sensation ceased. The operator opened the door and shouted, "Everybody out!"

Don walked into a large inner compartment, carrying his bags. It was already crowded with more than half of the ship's passengers. Don looked around for his dragon friend, then remembered that the ship would have to be moved around to a cargo port before the Venerian could disembark. He put his bags on the floor and sat down on them.

The crowd, for some reason, seemed unquiet. Don heard one woman say, "This is preposterous! We've been here at least half an hour and no one appears to know that we're here."

A man answered, "Be patient, Martha."

" 'Patient' he says! Only one door out of the place and it locked—suppose there were a fire?"

"Well, where would you run to, dear? Nothing outside but some mighty thin vacuum."

She squealed. "Oh! We should have gone to Bermuda as I wanted to."

"As you wanted to?"

"Don't be petty!"

Another elevator load discharged and then another; the ship was empty. After many minutes more of grumbling, during which even Don began to wonder at the service, the only door other than the elevator door opened. Instead of a hotelman anxious to please his guests, in came three men in uniform. The two flank men were carrying mob guns cradled at their hips; the third man had only a hand pistol, still holstered. He stepped forward, planted his feet and set his fists on his hips. "Attention! Quiet, everybody."

He got it; his voice had the ring of command, which is obeyed without thinking. He went on, "I am Assault Sergeant McMasters of the High Guard, Venus Republic. My commanding officer has directed me to advise you of the present situation."

There was an additional short moment of silence, then a rising mutter of surprise, alarm, disbelief, and indignation. "Pipe down!" the sergeant shouted. "Take it easy. Nobody's going to get hurt—if you behave." He went on, "The Republic has taken over this station and everybody is being cleared out. You groundhogs will be shipped back to Earth at once. Those of you who are headed home to Venus will go home — provided you pass our loyalty check. Now, let's get sorted out."

A fussy, plump man pushed his way forward. "Do you realize, sir, what you are saying? 'Venus Republic,' indeed. This is piracy!"

"Get back in line, fatty."

"You can't do this. I wish to speak to your commanding officer."

"Fatty," the sergeant said slowly, "back up before you get a boot in your belly." The man looked dumbfounded, then scuttled back into the crowd.

The sergeant continued, "Those of you going to Venus form a queue here at the door. Have your ID's and birth certificates ready."

The passengers, up to that time a friendly group of fellow travelers, split into hostile camps. Someone shouted, "Long live the Republic!", which was followed by the beefy sound of a fist striking flesh. One of the guards hurried into the crowd and stopped the impending riot. The sergeant drew his sidearm and said in a bored voice, "No politics, please. Let's get on with the job."

Somehow a line was formed. The second in line was the man who had cheered the new nation. His nose was dripping blood but his eyes were shining. As he offered his papers to the sergeant he said, "This is a great day! I've waited all my life for it."

"Who hasn't?" the sergeant answered. "Okay—on through the door for processing. Next!"

Don was busy trying to quiet down and arrange his whirling thoughts. He was forced at last to admit that this was it, this was war, the war that he had told himself was impossible. No cities had been bombed, not yet, but this was the Fort Sumter of a new war; he was smart enough to see that. He did not have to be threatened with a boot in the belly to see what was in front of his face.

He realized with nervous shock that he had just barely gotten away in time. The Valkyrie might be the last ship to Mars in a long, long time. With the transfer station in the hands of the rebels it might be the last one for years.

The sergeant had not said anything about passengers for Mars as yet; Don told himself that the sergeant's first effort must naturally be to sort out the citizens of the two belligerents. He decided that the thing to do was to keep his mouth shut and wait.

There was an interruption in the queue. Don heard the sergeant say, "You're in the wrong pew, bud. You go back to Earth."

The man he was speaking to answered, "No, no! Take a look at my papers; I'm emigrating to Venus."

"You're a little bit late to be emigrating. The situation has changed."

"Why? Sure, I know it has changed. I declare for Venus."

The sergeant scratched his head. "This one isn't in the book. Atkinson! Pass this man on through; we'll let the lieutenant figure it out."

When he had completed the group that wanted to go to Venus the sergeant went to a speech-only wall phone. "Jim? Mac speaking, from the nursery. They got that dragon out yet? No? Well, let me know when the Road is back at the chute; I want to load." He turned back to the crowd. "All right, you groundhogs—there'll be a delay so I'm going to move you into another room until we're ready to send you hack to Earth."

"Just a moment, Sergeant!" called out a male passenger.

"Yeah? What do you want?"

"Where do passengers for Luna wait?"

"Huh? Service discontinued. You're going hack to Earth."

"Now, Sergeant, let's be reasonable. I haven't the slightest interest in politics; it does not matter to me who administers this station. But I have business on the Moon. It is essential that I get to the Moon. A delay would cost millions!"

The sergeant stared at him. "Now isn't that just too bad! You know, brother, I've never had as much as a thousand at one time in my life; the thought of losing millions scares me." His manner suddenly changed. "You stupid jerk, have you ever thought what a bomb would do to the roof of Tycho City? Now line up, all of you, double file."

Don listened to this with disquiet. Still, the sergeant had not said anything about Mars. He got into line, but at the very end. When the tail of the line reached the door he stopped. "Get a move on, kid," said the sergeant.

"I'm not going back to Earth," Don told him.

"Huh?"

"I'm headed for Mars in the Valkyrie."

"Oh, I see. You mean you were, now you're headed back to Earth in the Glory Road."

Don said stubbornly, "Look, mister, I've got to get to Mars. My parents are there; they are expecting me."

The sergeant shook his head. "Kid I feel sorry for you. I really do.

The Valkyrie isn't going to Mars."

"What?"

"She's being recommissioned as a cruiser of the High Guard. She's going to Venus. So I guess you had better go back to Earth. I'm sorry you won't be able to join your folks, but war is like that."

Don breathed slowly and forced himself to count up to ten. "I'm not going back to Earth. I'll wait right here until a ship does go to Mars."

The sergeant sighed. "If you do, you'll have to chin yourself on a star while you wait."

"Huh? What do you mean?"

"Because," he said slowly, "a few minutes after we blast off there will be nothing in this neighborhood but a nice, pretty radioactive cloud. Want to play a leading role in a Geiger counter?"

VI

THE SIGN IN THE SKY

Don could not answer. His simian ancestors, beset with perils every moment of life, might have taken it calmly; Don's soft life had not prepared him for such repeated blows. The sergeant went on, "So it had better be the Glory Road for you kid. That's what your parents would want. Go back and find yourself a nice spot in the country; the cities are likely to be unhealthy for a while."

Don snapped out of it. "I'm not going back to Earth! I don't belong there; I'm not a native of Earth."

"Eh? What is your citizenship? Not that it matters; anybody who isn't a citizen of Venus goes back in the Glory Road."

"I'm a Federation citizen," Don answered, "but I can claim Venus citizenship."

"The Federation," the sergeant answered, "has had a slump in its stock lately. But what's this about Venus citizenship? Stop the doubletalk and let's see your papers."

Don passed them over. Sergeant McMasters looked first at his birth certificate, then stared at it. "Born in free fall! I'll be a crosseyed pilot — say, there aren't many like you, are there?"

"I guess not."

"But just what does that make you?"

"Read on down. My mother was born on Venus. I'm Venus native born, by derivation."

"But your pop was born on Earth."

"I'm native born there, too."

"Huh? That's silly."

"That's the law."

"There are going to be some new laws. I don't know just where you fit. See here — where do you want to go? Venus or Earth?"

"I'm going to Mars," Don answered simply.

The sergeant looked at him and handed back the papers. "It beats me. And I can't get any sense out of you. I'm going to refer it on up. Come along."

He led Don down a passageway and into a small compartment which had been set up as an orderly room. Two other soldiers were there; one was using a typer, the other was just sitting. The sergeant stuck his head in and spoke to the one who was loafing. "Hey, Mike—keep an eye on this character. See that he doesn't steal the station." He turned back to Don. "Give me those papers again, kid." He took them and went away.

The soldier addressed as Mike stared at Don, then paid no further attention to him. Don put his bags down and sat on them.

After several minutes Sergeant McMasters returned but ignored Don. "Who's got the cards?" he inquired.

"I have."

"Not your readers, Mike. Where are the honest cards?" The third soldier closed the typer, reached in a drawer and pulled out a deck of cards. The three sat down at the desk and McMasters started to shuffle. He turned to Don. "Care for a friendly game, kid?"

"Uh, I guess not."

"You'll never learn any cheaper." The soldiers played cards for half an hour or so while Don kept quiet and thought. He forced himself to believe that the sergeant knew what he was talking about; he could not go to Mars in the Valkyrie because the Valkyrie was not going to Mars. He could not wait for a later ship because the station — this very room he was sitting in — was about to be blown up.

What did that leave? Earth? No! He had no relatives on Earth, none close enough to turn to. With Dr. Jefferson dead or missing be had no older friends. Perhaps he could crawl back to the ranch, tail between his legs.

No! He had outgrown that skin and shed it. The ranch school was no longer for him.

Down inside was another and stronger reason: the security police in New Chicago had made of him an alien; he would not go back because Earth was no longer his.

Hobson's choice, he told himself; it's got to be Venus. I can find people there whom I used to know—or know Dad and Mother. I'll scrounge around and find some way to get from there to Mars; that's best. His mind made up, he was almost content.

The office phone called out: "Sergeant McMasters!" The sergeant laid down his hand and went to it, pulling the privacy shield into place. Presently he switched off and turned to Don. "Well, kid, the Old Man has settled your status; you're a 'displaced person.'"

"Huh?"

"The bottom fell out for you when Venus became an independent republic. You have no citizenship anywhere. So the Old Man says to ship you back where you come from . . . back to Earth."

Don stood up and squared his shoulders. "I won't go."

"You won't, eh?" McMasters said mildly. "Well, just sit hack down and be comfortable. When the time comes, we'll drag you." He started to deal the cards again.

Don did not sit down. "See here, I've changed my mind. If I can't get to Mars right away, then I'll go to Venus."

McMasters stopped and turned around. "When Commodore Higgins settles a point, it's settled. Mike, take this prima donna across and shove him in with the other groundhogs."

"But. . ."

Mike stood up. "Come on, you."

Don found himself shoved into a room packed with injured feelings. The Earthlings had no guards and no colonials in with them; they were giving vent freely to their opinions about events. "Outrage! We should blast every one of their settlements, level them to the ground!" "—I think we should send a committee to this commanding officer of theirs and say to him firmly—" "I told you we shouldn't have come!" "Negotiate? That's a sign of weakness." "Don't you realize that the war is already over? Man, this place isn't just a traffic depot; it's the main guidedmissile control station. They can bomb every last city on Earth from here, like ducks on a pond!"

Don noticed the last remark, played it over in his mind, let it sink in. He was not used to thinking in terms of military tactics; up to this moment the significance of a raid on Circum-Terra had been lost on him. He had thought of it in purely personal terms, his own convenience.

Would they actually go that far? Bomb the Federation cities right off the map? Sure, the colonials had plenty to be sore about, but— of course, it had happened like that, once in the past, but that was history; people were more civilized now. Weren't they?

"Harvey! Donald Harvey!"

Everyone turned at the call. A Venus Guardsman was standing in the compartment door, shouting his name. Don answered, "Here."

"Come along."

Don picked up his bags and followed him out into the passageway, waited while the soldier relocked the door. "Where are you taking me?"

"The C. O. wants to see you." He glanced at Don's baggage. "No need to drag that stuff."

"Uh, I guess I'd better keep it with me."

"Suit yourself. But don't take it into the C. O.'s office." He took Don down two decks where the "gravity" was appreciably greater and stopped at a door guarded by a sentry. "Here's the guy the Old Man sent for—Harvey."

"Go right on in."

Don did so. The room was large and ornate; it had been the office of the hotel manager. Now it was occupied by a man in uniform, a man still young though his hair was shot with grey. He looked up as Don came in; Don thought he looked alert but tired. "Donald Harvey?"

"Yes, sir." Don got out his papers.

The commanding officer brushed them aside. "I've seen them. Harvey, you are a headache to me. I disposed of your case once."

Don did not answer; the other went on, "Now it appears that I must reopen it. Do you know a Venerian named—" He whistled it.

"Slightly," Don answered. "We shared a compartment in the Glory Road."

"Hmm. . . . I wonder if you planned it that way?"

"What? How could I?"

"It could have been arranged and it would not be the first time that a young person has been used as a spy."

Don turned red. "You think I am a spy, sir?"

"No, it is just one of the possibilities I must consider. No military commander enjoys political pressure being used on him, Harvey, but they all have to yield to it. I've yielded. You aren't going back to Earth; you are going to Venus." He stood up. "But let me warn you; if you are a ringer who has been planted on me, all the dragons on Venus won't save your skin." He turned to a ship's phone, punched its keys, and waited; presently he said, "Tell him his friend is here and that I've taken care of the matter." He turned back to Don. "Take it."

Shortly Don heard a warm Cockney voice, "Don, my dear boy, are you there?"

"Yes, Sir Isaac."

The dragon shrilled relief. "When I inquired about you, I found some preposterous intention of shipping you back to that dreadful place we just quitted. I told them that a mistake had been made. I'm afraid I had to be quite firm about it. Shucks!"

"It's all fixed up now, Sir Isaac. Thanks."

"Not at all; I am still in your debt. Come to visit me when it is possible. You will, won't you?"

"Oh, sure!"

"Thank you and cheerio! Shucks."

Don turned away from the phone to find the task force commander studying him quizzically. "Do you know who your friend is?"

"Who he is?" Don whistled the Venerian name, then added, "He calls himself 'Sir Isaac Newton.'"

"That's all you know?"

"I guess so."

"Mmm—" He paused, then went on, "You might as well know what influenced me. 'Sir Isaac,' as you call him, traces his ancestry directly back to the Original Egg, placed in the mud of Venus on the day of Creation. So that's why I'm stuck with you. Orderly!"

Don let himself be led away without saying a word. Few if any Earthlings have been converted to the dominant religion of Venus; it is not a proselytizing faith. But none laugh at it; all take it seriously. A terrestrial on Venus may not believe in the Divine Egg and all that that implies; he finds it more profitable—and much safer—to speak of it with respect.

Sir Isaac a Child of the Egg! Don felt the sheepish awe that is likely to strike even the most hard-boiled democrat when he first comes in contact with established royalty. Why, he had been talking to him, just as if he were any old dragon—say one that sold vegetables in the city market.

Shortly he began to think of it in more practical ways. If anyone could wangle a way for him to get to Mars, Sir Isaac was probably just the bird who could do it. He turned it over in his mind—he'd get home yet!

But Don did not get to see his Venerian friend at once. He was herded into the Nautilus along with Venus-bound passengers from the Glory Road and a handful of technicians from Circum-Terra whose loyalties lay with Venus rather than with Earth. By the time he discovered that Sir Isaac had been transshipped to the Valkyrie it was too late to do anything about it.

The flag of the task force commander, High Commodore Higgins, was shifted from Circum-Terra back to the Nautilus, and Higgins moved at once to carry out the rest of the coup. The storming of Circum-Terra had been managed almost without bloodshed; it had depended on timing and surprise. Now the rest of the operation must be completed before any dislocation in ship schedules would be noticed on Earth.

The Nautilus and the Valkyrie had already been prepared for their long jumps; the Spring Tide's crew was removed to be sent to Earth and a crew supplied from the task force; she herself was fueled and provisioned for deep space. Although designed for the short jump to Luna, she was quite capable of making the trip to Venus. Space travel is not a matter of distance but of gravity potential levels; the jump from Circum-Terra to Venus required less expenditure of energy than did the terrible business of fighting up though Earth's field from New Chicago to Circum-Terra.

The Spring Tide shoved off in a leisurely, economical parabola; she would make the trip to Venus in free fall all the way. The Valkyrie blasted away to shape a fast, almost flat, hyperboloid orbit; she would arrive as soon or sooner than the Nautilus. The Nautilus was last to leave, for High Commodore Higgins had one more thing to do before destroying the station—a television broadcast on a globe-wide network.

All global broadcasts originated in, or were relayed through, the communications center of Circum-Terra. Since the Nautilus had touched in at Circum-Terra, a cosmic Trojan horse, the regular broadcasts had been allowed to continue uninterrupted. The commodore's C-6 staff officer (propaganda and nerve warfare) picked as the time for the commodore's announcement to Earth of the coup the time ordinarily given over to "Steve Brodie Says:" the most widely heard global news commentator. Mr. Brodie immediately followed the immensely popular "Kallikak Family" serial drama, an added advantage audience-wise.

The Glory Road had been allowed at last to blast off for Earth with her load of refugees but with her radios wrecked. The Nautilus lay off in space, a hundred miles outside, hanging in a parking orbit, waiting. Inside the space station, now utterly devoid of life, the television center continued its functions unattended. The commodore's speech had already been canned; its tape was threaded into the programmer and it would start as soon as the throb show was over.

Don watched it from a recreation lounge of the liner along with a hundred-odd other civilians. All eyes were on a big television tank set in the end of the compartment. A monitoring beam, jury-rigged for the purpose, brought the cast from Circum-Terra to the Nautilus and the radio watch in the ship was passing it on throughout the ship so that the passengers and crew might see and hear it.

As the day's serial episode closed, Celeste Kallikak had been arrested for suspected husband murder, Buddy Kallikak was still in the hospital and not expected to live, Father Kallikak was still missing, and Maw Kallikak was herself suspected of cheating on ration stamps—but she was facing it all bravely, serene in her knowledge that only the good die young. After the usual commercial plug ("The Only Soap with Guaranteed Vitamin Content for greater Vitacity!!!") the tank faded into Steve Brodie's trademark, a rocket trail condensing into his features while a voice boomed, "Steve Brodie, with tomorrow's news TODAY!"

It cut suddenly, the tank went empty and a voice said, "We interrupt this broadcast to bring you a special news flash." The tank filled again, this time with the features of Commodore Higgins.

His face lacked the synthetic smile obligatory for all who speak in public telecast; his manner and voice were grim. "I am High Commodore Higgins, commanding Task Force Emancipation of the High Guard, Venus Republic. The High Guard has seized Earth's satellite station Circum-Terra. We now have all of Earth's cities utterly at our mercy."

He paused to let it sink in. Don thought it over and did not like the thought. Everybody knew that Circum-Terra carried enough A-bomb rockets to smear any force or combination of forces that could be raised to oppose the Federation. The exact number of rocket bombs carried was a military secret, variously estimated between two hundred and a thousand. A rumor had spread through the civilians in the Nautilus that the High Guard had found seven hundred and thirty-two bombs ready to go, with component parts for many more, plus enough deuterium and tritium to make up about a dozen H bombs.

Whether the rumor was true or not, Circum-Terra certainly held enough bombs to turn the Terran Federation into a radioactive abattoir. No doubt with so much under ground many inhabitants of cities would survive, but any city, once bombed, would have to be abandoned; the military effect would be the same. And many would die. How many? Forty millions? Fifty millions? Don did not know.

The commodore went on, "Mercifully we stay our hand. Earth's cities will not be bombed. The free citizens of Venus Republic have no wish to slaughter their cousins still on Terra. Our only purpose is to establish our own independence, to manage our own affairs, to throw off the crushing yoke of absentee ownership and of taxation without representation, which has bled us poor.

"In so doing, in so taking our stand as free men, we call on all oppressed and impoverished nations everywhere to follow our lead, accept our help. Look up into the sky! Swimming there above you is the very station from which I now address you. The fat and stupid rulers of the Federation have made of Circum-Terra an overseer's whip. The threat of this military base in the sky has protected their empire from the just wrath of their victims for more than five score years.

"We now crush it."

"In a matter of minutes this scandal in the clean skies, this pistol pointed at the heads of men everywhere on your planet, will cease to exist. Step out of doors, watch the sky. Watch a new sun blaze briefly and know that its light is the light of Liberty inviting all Earth to free itself.

"Subject peoples of Earth, we free men of the free Republic of

Venus salute you with that sign!"

The commodore continued to sit and gaze steadily into the eyes of each of his colossal audience while the heartlifting beat of Morning Star of Hope followed his words. Don did not recognize the anthem of the new nation; he could not help but feel its surging promise.

Suddenly the tank went dead and at the same instant there was a flash of light so intense that it leaked through the shuttered ports and tormented the optic nerve. Don was still shaking his head from it when over the ship's announcing system came the call: "Safe to unshutter!"

A petty officer stationed at the compartment's view port was already cranking the metal shield out of the way; Don crowded in and looked.

A second sun blazed white and swelled visibly as he watched. What on Earth would have been—so many terrible times had been—a climbing mushroom cloud was here in open space a perfect geometrical sphere, growing unbelievably. It swelled still larger, dropping from limelight white to silvery violet, became blotched with purple, red and flame. And still it grew, until it blanked out Earth beyond it.

At the time it was transformed into a radioactive cosmic cloud Circum-Terra had been passing over, or opposite, the North Atlantic; the swollen incandescent cloud was visible to most of the habitable portions of the globe, a burning symbol in the sky.

VII

DETOUR

Immediately after the destruction of Circum-Terra the ship's warning signal howled and loudspeakers bellowed, ordering all hands to acceleration stations. The Nautilus blasted away, shaping her orbit for the weary trip to Venus. When she was up to speed and spin had been placed on her to permit sure footing the control room secured from blast stations. Don unstrapped and hurried to the radio room. Twice he had to argue to get past sentries.

He found the door open; everyone inside seemed busy and paid him no attention. He hesitated, then stepped inside. A long hand reached out and grabbed him by the scruff. "Hey! Where the deuce do you think you're going?"

Don answered humbly, "I just want to send a message."

"You do, eh? What do you think of that, Charlie?" His captor appealed to a soldier who was bending over a rig.

The second soldier pushed one earphone up. "Looks like a sabatoor. Probably an A-bomb in each pocket."

An officer wandered out of an inner room. "What goes on here?"

"Sneaked in, sir. Says he wants to send a message."

The officer looked Don up and down. "Sorry. No can do. Radio silence. No traffic outgoing."

"But," Don answered desperately, "I've just got to." Quickly he explained his predicament. "I've got to let them know where I am, sir."

The officer shook his head. "We couldn't raise Mars even if we were not in radio silence."

"No, sir, but you could beam Luna, for relay to Mars."

"Yes, I suppose we could — but we won't. See here, young fellow, I'm sorry about your troubles but there is no possibility, simply none at all, that the commanding officer will permit silence to he broken for any reason, even one much more important than yours. The safety of the ship comes first."

Don thought about it. "I suppose so," he agreed forlornly.

"However, I wouldn't worry too much. Your parents will find out where you are."

"Huh? I don't see how. They think I'm headed for Mars."

"No, they don't—or won't shortly. There is no secret now about what has happened; the whole system knows it. They can find out that you got as far as Circum-Terra; they can find out that the Glory Road did not fetch you back. By elimination, you must be on your way to Venus. I imagine that they are querying Interplanet about you right now."

The officer turned away and said, "Wilkins, paint a sign for the door saying, 'Radio Silence—No Messages Accepted.' We don't want every civilian in the ship barging in here trying to send greetings to Aunt Hattie."

Don bunked in a third-class compartment with three dozen men and a few boys. Some passengers who had paid for better accommodations complained. Don himself had had first-class passage booked for the Valkyrie and Mars, but he was glad that he had not been silly enough to object when he saw the disgruntled returning with their tails between their legs. First-class accommodations, up forward, were occupied by the High Guard.

His couch was comfortable enough and a space voyage, dull under any circumstances, is less dull in the noise and gossip of a bunkroom than it is in the quiet of a first-class stateroom. During the first week out the senior surgeon announced that any who wished could avail themselves of coldsleep. Within a day or two the bunkroom was half deserted, the missing passengers having been drugged and chilled and stowed in sleep tanks aft, there to dream away the long weeks ahead.

Don did not take coldsleep. He listened to a bunkroom discussion, full of half facts, as to whether or not coldsleep counted against a man's lifetime. "Look at it this way," one passenger pontificated. "You've got so long to live—right? It's built into your genes; barring accidents, you live just that long. But when they put you in the freezer, your body slows down. Your clock stops, so to speak. That time doesn't count against you. If you had eighty years coming to you, now you've got eighty years plus three months, or whatever. So I'm taking it."

"You couldn't be wronger," he was answered. "More wrong, I mean. What you've done is chop three months right out of your life. Not for me!"

"You're crazy. I'm taking it."

"Suit yourself. And another thing—" The passenger who opposed it leaned forward and spoke confidentially, so that only the entire bunkroom could hear. "They say that the boys with the bars up front question you while you are going under. You know why? Because the Commodore thinks that spies slipped aboard at Circum-Terra."

Don did not care which one was right. He was too much alive to relish deliberately "dying" for a time simply to save the boredom of a long trip. But the last comment startled him. Spies? Was it possible that the I.B.I. had agents right under the noses of the High Guard? Yet the I.B.I. was supposed to be able to slip in anywhere. He looked around at his fellow passengers, wondering which one might be traveling under a false identity.

He put it out of his mind—at least the I.B.I. was no longer interested in him.

Had Don not known that he was in the Nautilus headed for Venus he might well have imagined himself in the Valkyrie headed for Mars. The ships were of the same class and one piece of empty space looks like another. The Sun grew daily a little larger rather than smaller—but one does not look directly at the Sun, not even from Mars. The ship's routine followed the same Greenwich day kept by any liner in space; breakfast came sharp on the bell; the ship's position was announced each "noon"; the lights were dimmed at "night."

Even the presence of soldiers in the ship was not conspicuous. They kept to their own quarters forward and civilians were not allowed there except on business. The ship was forty-two days out before Don again had any reason to go forward—to get a cut finger dressed in sick bay. On his way aft he felt a hand on his shoulder and turned.

He recognized Sergeant McMasters. The sergeant was wearing the star of a master-at-arms, a ship's policeman. "What are you doing," he demanded, "skulking around here?"

Don held up his damaged digit. "I wasn't skulking; I was getting this attended to."

McMasters looked at it. "Mashed your finger, eh? Well, you're in the wrong passageway. This leads to the bomb room, not to passengers' quarters. Say, I've seen you before, haven't I?"

"Sure."

"I remember. You're the lad who thought he was going to Mars."

"I'm still going to Mars."

"So? You seem to favor the long way around—by about a hundred million miles. Speaking of the long way around, you haven't explained why I find you headed toward the bomb room."

Don felt himself getting red. "I don't know where the bomb-room is. If I'm in the wrong passage, show me the right one."

"Come with me." The sergeant led him down two decks where the spin of the ship made them slightly heavier and conducted Don into an office. "Sit down. The duty officer will be along."

Don remained standing. "I don't want to see the duty officer. I want to go back to my bunkroom."

"Sit down, I said. I remember your case. Maybe you were just turned around but could be you took the wrong turn on purpose."

Don swallowed his annoyance and sat. "No offense," said McMasters. "How about a slug of solvent?" He went to a coffee warmer and poured two cups.

Don hesitated, then accepted one. It was the Venerian bean, black and bitter and very strong. Don found himself beginning to like McMasters. The sergeant sipped his, grimaced, then said, "You must be born lucky. You ought to be a corpse by now."

"Huh?"

"You were scheduled to go back in the Glory Road, weren't you? Well?"

"I don't track you."

"Didn't the news filter aft? The Glory didn't make it."

"Huh? Crashed?"

"Hardly! The Federation groundhogs got jumpy and blasted her out of the sky. Couldn't raise her and figured she was booby-trapped, I guess. Anyhow they blasted her."

"Oh."

"Which is why I say you were born lucky, seeing as how you were supposed to go back in her."

"But I wasn't. I'm headed for Mars."

McMasters stared at him, then laughed. "Boy, have you got a one-track mind! You're as bad as a 'moveover.' "

"Maybe so, but I'm still going to Mars."

The sergeant put down his cup. "Why don't you wise up? This war is going to last maybe ten or fifteen years. Chances are there won't be a scheduled ship to Mars in that whole time."

"Well . . . I'll make it, somehow. But why do you figure it will last so long?"

McMasters stopped to light up. "Studied any history?"

"Some."

"Remember how the American colonies got loose from England? They piddled along for eight years, fighting just now and then—yet England was so strong that she should have been able to lick the colonies any weekend. Why didn't she?"

Don did not know. "Well," McMasters answered, "you may not be a student of history, but Commodore Higgins is. He planned this strike. Ask him about any rebellion that ever happened; he'll tell you why it succeeded, or why it failed. England didn't lick the colonies because she was up to her ears in bigger wars elsewhere. The American rebellion was just a 'police action'—not important. But she couldn't give proper attention to it; after a while it got to be just too expensive and too much trouble, so England gave up and recognized their independence."

"You figure this the same way?"

"Yes—because Commodore Higgins gave it a shove in the right direction. Figured on form, the Venus Republic can't win against the Federation. Mind you, I'm just as patriotic as the next—but I can face facts. Venus hasn't a fraction of the population of the Federation, nor one per cent of its wealth. Venus can't win—unless the Federation is too busy to fight. Which it is, or will be soon."

Don thought about it. "I guess I'm stupid."

"Didn't you grasp the significance of blowing up Circum-Terra? In one raid the Commodore had Earth absolutely helpless. He could have bombed any or all of Terra's cities. But what good would that have done? It would simply have gotten the whole globe sore at us. As it is, we've got two-thirds of the peoples of Earth cheering for us. Not only cheering but feeling frisky and ready to rebel themselves, now that Circum-Terra isn't sitting up there in the sky, ready to launch bombs at the first sign of unrest. It will take the Federation years to pacify the associate nations—if ever. Oh, the Commodore is a sly one!" McMasters glanced up. "'Tenshun!" he called out and got to his feet.

A lieutenant of the High Guard was in the doorway. He said, "That was a very interesting lecture, professor, but you should save it for the classroom."

"Not 'professor,' Lieutenant," McMasters said earnestly. " 'Sergeant,' if you please."

"Very well, Sergeant—but don't revert to type." He turned to Don. "Who is this and why is he loafing here?"

"Waiting for you, sir." McMasters explained the circumstances.

"I see," answered the duty officer. He said to Don, "Do you waive your right not to testify against yourself?"

Don looked puzzled. "He means," explained McMasters, "do we try the gimmick on you, or would you rather finish the trip in the brig?"

"The gimmick?"

"Lie detector."

"Oh. Go ahead. I've got nothing to hide."

"Wish I could say as much. Sit down over here." McMasters opened a cupboard, fitted electrodes to Don's head and a bladder gauge to his forearm. "Now," he said, "tell me the real reason why you were skulking around the bomb room!"

Don stuck to his story. McMasters asked more questions while the lieutenant watched a "wiggle" scope back of Don's head. Presently he said, "That's all, Sergeant. Chase him back where he belongs."

"Right, sir. Come along." They left the room together. Once out of earshot McMasters continued: "As I was saying when we were so crudely interrupted, that is why you can expect a long war. The 'status' will stay 'quo' while the Federation is busy at home with insurrections and civil disorder. From time to time they'll send a boy to do a man's job; we'll give the boy lumps and send him home. After a few years of that the Federation will decide that we are costing more than we are worth and will recognize us as a free nation. In the meantime there will be no ships running to Mars. Too bad!"

"I'll get there," Don insisted.

"You'll have to walk."

They reached "G" deck. Don looked around and said, "I know my way from here. I must have gone down a deck too many."

"Two decks," McMasters corrected, "but I'll go with you until you are back where you belong. There is one way you might get to Mars—probably the only way."

"Huh? How? Tell me how?"

"Figure it out. There won't be any passenger runs, not till the war is over, but it is a dead cinch that both the Federation and the Republic will send task forces to Mars eventually, each trying to preempt the facilities there for the home team. If I were you, I'd enlist in the High Guard. Not the Middle Guard, not the Ground Forces—but the High Guard."

Don thought about it. "But I wouldn't stand much chance of getting to go along would I?"

"Know anything about barracks politics? Get yourself a job as a clerk. If you've any skill at kissing the proper foot, a clerk's job will keep you around Main Base. You'll be close to the rumor factory and you'll know when they finally get around to sending a ship to Mars.

Kiss the proper foot again and put yourself on the roster. That's the only way you are likely to get to Mars. Here's your door. Mind you don't get lost up forward again."

Don turned McMasters' words over in his mind for the next several days. He had clung stubbornly to the idea that, when he got to Venus, he would find some way to wrangle passage to Mars. McMasters forced him to regroup his thoughts. It was all very well to talk about getting in some ship headed for Mars—somehow, legally or illegally, paid passenger, crew member, or stowaway. But suppose there were no ships heading for Mars? A lost dog might beat his way back to his master—but a man could not travel a single mile in empty space without a ship. A total impossibility.

But that notion of joining the High Guard? It seemed a drastic solution even if it would work and—little as Don knew about the workings of military organization—he held a dark suspicion that the sergeant had oversimplified things. Using the High Guard to get to Mars might prove as unsatisfactory as trying to hitchhike on a Kansas twister.

On the other hand he was at the age at which the idea of military service was glamorous in itself. Had his feelings about Venus been just a touch stronger he could easily have persuaded himself that it was his duty to throw in with the colonists and sign up, whether it got him to Mars or not.

Enlisting held another attraction: it would give pattern to his life. He was beginning to feel the basic, gnawing tragedy of the wartime displaced person, the loss of roots. Man needs freedom, but few men are so strong as to be happy with complete freedom. A man needs to be part of a group, with accepted and respected relationships. Some men join foreign legions for adventure; still more swear on a bit of paper in order to acquire a framework of duties and obligations, customs and taboos, a time to work and a time to loaf, a comrade to dispute with and a sergeant to hate—in short, to belong.

Don was as "displaced" as any wanderer in history; he had not even a planet of his own. He was not conscious of his spiritual need—but he took to staring at the soldiers of the High Guard when he ran across them, imagining what it would be like to wear that uniform.

The Nautilus did not land, nor did she tie up to a space station. Instead her speed was reduced as she approached the planet so that she fell into a 2-hour, pole-to-pole parking orbit only a few hundred miles outside the silvery cloud blanket. The Venus colonies were too young, too poor, to afford the luxury of a great orbiting station in space, but a fast pole-to-pole parking orbit caused a ship to pass over every part of the spinning globe, an "orange slice" at each pass—like winding string on a ball.

A shuttle ship up from the surface could leave any spot on Venus, rendezvous with the ship in orbit, then land on its port of departure or on any other point having expended a theoretical minimum of fuel. As soon as the Nautilus had parked such shuttles began to swarm up to her. They were more airplane than spaceship, for, although each was sealed and pressurized to operate outside the atmosphere while making contact with orbiting spaceships, each was winged and was powered with ramjet atmosphere engines as well as with rocket jets. Like frogs, they were adapted to two media.

A shuttle would be launched by catapult from the surface, her ramjets would take hold and she would climb on her wings, reaching in the thin, cold heights of the upper stratosphere speeds in excess of three thousand miles an hour. There, as her ramjets failed for want of air, her rocket jets would take over and kick her forward to orbiting speed of around twelve thousand miles an hour and permit her to match in with a spaceship.

A nice maneuver! It required both precise mathematical calculation of times, orbits, fuel expenditure, and upper air weather and piloting virtuosity beyond mathematical calculation—but it saved pennies. Once the shuttle was loaded at the spaceship it was necessary only to nudge it with its rockets against the orbital direction whereupon the shuttle would drop into a lower orbit which would eventually intersect the atmosphere and let the pilot take a free ride back to the surface, glider fashion, killing his terrible speed by dipping ever lower into the thickening air. Here again the pilot must be an artist, for he must both kill his momentum and conserve it so that it would take him where he wanted to go. A shuttle, which landed out in the bush, a thousand miles from a port, would never make another trip, even if pilot and passengers walked away from the landing.

Don went down in the Cyrus Buchanan, a trim little craft of hardly three hundred feet wingspread. From a port Don watched her being warped in to match air locks and noticed that the triple globes of Interplanet Lines had been hastily and inadequately painted out on her nose and over had been stenciled: MIDDLE GUARD—VENUS REPUBLIC. This defaced insignia brought the rebellion home to him almost more than had the bombing of Circum-Terra. Interplanet was strong as government—some said it was the government. Now hardy rebels had dared to expropriate ships of the great transport trust, paint out the proud triple globes.

Don felt the winds of history blowing coldly around his ears. McMasters was right; he now believed that no ship would run from here to Mars.

When his turn came he pulled himself along through the air locks and into the Cyrus Buchanan. The craft's steward was still in the uniform of Interplanet but the company's insignia had been removed and chevrons had been sewed to his sleeves. With this change had come a change in manner; he handled the passengers efficiently but without the paid deference of the semi-servant.

The trip down was long, tedious, and hot, as an atmosphere-braking series always is. More than an hour after touch off the airfoils first took hold; shortly Don and the other passengers felt almost full weight pressing them into the cushions, then the pilot lifted her as he decided his ship was growing too hot, let her ride out and upward in free fall. Over and over again this happened, like a stone skipping on water, a nauseating cosmic roller coaster, vastly uncomfortable.

Don did not mind. He was a spaceman again; his stomach was indifferent to surges of acceleration or even the absence thereof. At first he was excited at being back in the clouds of Venus; presently he was bored. At long, long last he was awakened by a change in motion; the craft was whistling down in its final glide, the pilot stabbing ahead with radar for his landing. Then the Cyrus Buchanan touched, bounced, and quivered to the rushing water under her hull. She slowed and stopped. After a considerable wait she was towed to her berth. The steward stood up and shouted, "New London! Republic of Venus! Have your papers ready."

VIII

"FOXES HAVE HOLES AND BIRDS OF THE AIR HAVE NESTS"

Don's immediate purpose was to ask his way to the I. T. & T. office, there to file a radiogram to his parents, but he was unable to leave at once; the passengers had to have their papers inspected and they themselves were subjected to physical examinations and questioning. Don found himself, hours later, still sitting outside the security office, waiting to be questioned. His irregular status had sent him to the end of the line.

In addition to being hungry, tired, and bored, his arms itched—they were covered from shoulders to wrists with needle pricks caused by extensive testing for immunities to the many weird diseases and fungus-like infections of the second planet. Having once lived there he retained immunity to the peculiar perils of Venus—a good thing, he mused, else he would have had to waste weeks in quarantine while being inoculated. He was rubbing his arms and wondering whether or not he should kick up a fuss when the door opened and his name was called.

He went inside. An officer of the Middle Guard sat at a desk, looking at Don's papers. "Donald Harvey?"

"Yes, sir."

"Frankly, your case puzzles me. We've had no trouble identifying you; your prints check with those recorded when you were here before. But you aren't a citizen."

"Sure I am! My mother was born here."

"Mmmm—" The official drummed on his desktop. "I'm not a lawyer. I get your point, but, after all, when your mother was born, there wasn't any such nation as Venus Republic: Looks to me as if you were a test case, with precedent still to be established."

"Then where does that leave me?" Don said slowly.

"I don't know. I'm not sure you have any legal right to stay here at all."

"But I don't want to stay here! I'm just passing through."

"Eh?

"I'm on my way to Mars."

"Oh, that! I've seen your papers—too bad. Now let's talk sense, shall we?"

"I'm going to Mars," Don repeated stubbornly.

"Sure, sure! And I'm going to heaven when I die. In the meantime you are a resident of Venus whether we like it or not. No doubt the courts will decide, eventually, whether you are a citizen as well. Mr. Harvey, I've decided to turn you loose."

"Huh?" Don was startled; it had not occurred to him that his liberty could be in question.

"Yes. You don't seem like a threat to the safety of Venus Republic and I don't fancy holding you in quarantine indefinitely. Just keep your nose clean and phone in your address after you find a place to stay. Here are your papers."

Don thanked him, picked up his bags and left quickly. Once outside, he stopped to give his arms a good scratching.

At the dock in front of the building an amphibious launch was tied up; its coxswain was lounging at the helm.

Don said, "Excuse me, but I want to send a radio. Could you tell me where to go?"

"Sure. I. T. & T. Building, Buchanan Street, Main Island. Just down in the Nautilus?"

"That's right. How do I get there?"

"Jump in. I'll be making another trip in about five minutes. Any more passengers to come?"

"I don't think so."

"You don't sound like a fogeater." The coxswain looked him over.

"Raised on the stuff," Don assured him, "but I've been away at school for several years."

"Just slid in under the wire, didn't you?"

"Yeah, I guess so."

"Lucky for you. No place like home, I guess." The coxswain looked happily around at the murky sky and the dark waters.

Shortly he started his engine and cast off lines. The little vessel slopped its way through narrow channels, around islands and bars barely above water. A few minutes later Don disembarked at the foot of Buchanan Street, main thoroughfare of New London, capital of the planet.

There were several people loafing around the landing dock; they looked him over. Two of them were runners for rooming houses; he shook them off and started up Buchanan Street. The street was crowded with people but was narrow, meandering, and very muddy. Two lighted signs, one on each side of the street, shone through the permanent fog. One read: ENLIST NOW!!! YOUR NATION NEEDS YOU; the other exhorted in larger letters: Drink COCACOLA — New London Bottling Works.

The I. T. & T. Building turned out to be several hundred yards down the street, almost at the far side of Main Island, but it was easy to find as it was the largest building on the island. Don climbed over the coaming at the entrance and found himself in the local office of Interplanetary Telephone and Televideo Corporation. A young lady was seated behind a counter desk. "I'd like to send a radiogram," he said to her.

"That's what we're here for." She handed him a pad and stylus.

"Thanks." Don composed a message with much wrinkling of forehead, trying to make it both reassuring and informative in the fewest words. Presently he handed it in.

The girl raised her brows when she saw the address but made no comment. She counted the words, consulted a book, and said, "That'll be a hundred and eighty-seven fifty." Don counted it out, noting anxiously what a hole that made in his assets.

She glanced at the notes and pushed them back. "Are you kidding?"

"What's the matter?"

"Offering me Federation money. Trying to get me in trouble?"

"Oh." Don felt again a sick feeling at the pit of his stomach that was getting to be almost a habit. "Look—I'm just down in the Nautilus. I haven't had time to exchange this stuff. Can I send the message collect?"

"To Mars?"

"What should I do?"

"Well, there's the bank just down the street. If I were you I'd try there."

"I guess so. Thanks." He started to pick up his message; she stopped him.

"I was 'about to say that you can file your message if you like. You've got two weeks in which to pay for it."

"Huh? Why, thanks!"

"Don't thank me. It can't go out for a couple of weeks and you don't have to pay until we are ready to send it."

"Two weeks? Why?"

"Because Mars is right smacko back of the Sun now; it wouldn't punch through. We'll have to wait on the swing."

"Well, what's the matter with relay?"

"There's a war on—or hadn't you noticed?"

"Oh—" Don felt foolish.

"We're still accepting private messages both ways on the Terra-Venus channel — subject to paraphrase and censoring but we couldn't guarantee that your message would be relayed from Terra to Mars. Or could you instruct someone on Earth to pay for the second transmission?"

"Uh — I'm afraid not."

"Maybe it's just as well. They might not relay it for you even if you could get someone to foot the bill. The Federation censors might kill it. So give me that traffic and I'll file it. You can pay for it later." She glanced at the message. "Looks like you sort of ran into hard luck. How old are you" She glanced again at the form. "—Don Harvey?"

Don told her.

"Hmmm . . . you look older. I'm older than you are; I guess that makes me your grandmother. If you need any more advice, just stop in and ask Grandmother Isobel — Isobel Costello."

"Uh, thanks, Isobel."

"Not at all. Usual I. T. & T. service." She gave him a warm smile. Don left feeling somewhat confused.

The bank was near the center of the island; Don remembered having passed it. The sign on the glass read: BANK OF AMERICA & HONGKONG. Over this had been stuck strips of masking tape and under it was another sign handwritten in whitewash: New London Trust & Investment Company. Don went in, picked the shortest queue, and presently explained his wants. The teller hooked a thumb toward a desk back of a rail. "See him."

At the desk was seated an elderly Chinese dressed in a long black gown. As Don approached he stood up, bowed, and said, "May I help you, sir?"

Don again explained and laid his wad of bills on the banker's desk. The man looked at it without touching it. "I am so sorry."

"What's the matter?"

"You are past the date when one may legally exchange Federation currency for money of the Republic."

"But I haven't had a chance to before! I just got in."

"I am very sorry. I do not make the regulations."

"But what am I to do?"

The banker closed his eyes, then opened them. "In this imperfect world one must have money. Have you something to offer as security?"

"Uh, I guess not. Just my clothes and these bags."

"No jewelry?"

"Well, I've got a ring but I don't suppose it's worth much."

"Let me see it."

Don took off the ring Dr. Jefferson had mailed to him and handed it over. The Chinese stuck a watchmaker's loop in his eye and examined it. "I'm afraid you are right. Not even true amber—merely plastic. Still—a symbol of security will bind the honest man quite as much as chains. I'll advance fifty credits on it."

Don took the ring back and hesitated. The ring could not possibly be worth a tenth of that sum . . . and his stomach was reminding him that flesh has its insistent demands. Still—his mother had spent at least twice that amount to make sure that this ring reached him (or the paper it had been wrapped in, he corrected himself) and Dr. Jefferson had died in a fashion somehow connected with this same bauble.

He put it back on his finger. "That wouldn't be fair. I guess I had better find a job."

"A man of pride. There is always work to be found in a new and growing city; good luck. When you have found employment come back and we can arrange an advance against your wages." The banker reached into the folds of his gown, pulled out a single credit note. "But eat first—a full belly steadies the judgment. Do me the honor of accepting this as our welcome to the newcomer."

His pride said no; his stomach said YES! Don took it and said, "Uh, thanks! That's awfully kind of you. I'll pay it back, first chance."

"Instead, pay it forward to some other brother who needs it." The banker touched a button on his desk, then stood up.

Don said goodbye and left.

There was a man loitering at the door of the bank. He let Don get a step or two ahead, then followed him, but Don paid him no attention, being very busy with his own worries. It was slowly beginning to grow on him that the bottom had dropped out of his world and that there might be no way to put it back together. He had lived in security all his life; he had never experienced emotionally, in his own person, the basic historical fact that mankind lives always by the skin of its teeth, sometimes winning but more often losing—and dying.

But never quitting. In a hundred yards of muddy street he began to grow up, take stock of his situation. He was more than a hundred million miles from where he meant to be. He had no way at once to let his parents know where be was, nor was it a simple matter of waiting two weeks—he was flat broke, unable to pay the high tariff.

Broke, hungry, and no place to sleep . . . no friends, not even an acquaintance unless, he recalled, you counted "Sir Isaac," but, for all he knew, his dragon friend might be on the other side of the planet. Certainly not close enough at hand to affect the ham-and-eggs problem!

He decided to settle that problem at once by spending the note the banker had given him. He recalled a restaurant a short distance back and stopped suddenly, whereupon a man jostled him.

Don said, "Excuse me," and noted that the man was another Chinese—noted it without surprise as nearly half of the contract labor shipped in during the early days of the Venerian colonies had been Orientals. It did seem to him that the man's face was familiar—a fellow passenger in the Nautilus? Then he recalled that he had seen him at the dock at the foot of the street.

"My fault," the man answered. "I should look where I'm going. Sorry I bumped you." He smiled most charmingly.

"No harm done," Don replied, "but it was my fault. I suddenly decided to turn around and go back."

"Back to the bank?"

"Huh?"

"None of my business, but I saw you coming out of the bank."

"As a matter of fact," Don answered, "I wasn't going back to the bank. I'm looking for a restaurant and I remembered seeing one back there."

The man glanced at his bags. "Just get in?"

"Just down in the Nautilus."

"You don't want that restaurant—not unless you have money to throw away. It's strictly a tourist trap."

Don thought about the single credit note in his pocket and worried. "Uh, where can a chap get a bite to eat? A good, cheap restaurant?"

The man took his arm. "I'll show you. A place down by the water, run by a cousin of mine."

"Oh, I wouldn't want to put you to any trouble."

"Not at all. I was about to refresh the inner man myself. By the way, my name is Johnny Ling."

"Glad to know you, Mr. Ling. I'm Don Harvey."

The restaurant was in a blind alley off the foot of Buchanan Street.

Its sign advertised TWO WORLDS DINING ROOM—Tables for Ladies—WELCOME SPACEMEN. Three moveovers were hanging around the entrance, sniffing the odors and pressing their twitching noses against the screen door. Johnny Ling pushed them aside and ushered Don in.

A fat Cantonese stood behind the counter, presiding over both range and cash register. Ling called out, "Hi Charlie!"

The fat man answered, "Hello, Johnny," then broke into fluent cursing, mixing Cantonese, English, Portuguese, and whistle speech impartially. One of the moveovers had managed to slip in when the door was opened and was making a beeline for the pie rack, his little hooves clicking on the floor. Moving very fast despite his size the man called Charlie headed him off, took him by the ear and marched him out. Still cursing, Charlie returned to the pie rack, picked out half a pie that had seen better times and returned to the door. He tossed the pie to the fauns, who scrambled for it, bleating and whimpering.

"If you didn't feed them, Charlie," commented Ling, "they wouldn't hang around."

"You damn mind your own business!"

Several customers were eating at the counter; they paid no attention to the incident. Ling moved closer to the cook and said, "Back room empty?"

Charlie nodded and turned his back. Ling led Don through a swinging door; they ended up in a booth in the back of the building. Don sat down and picked up a menu, wondering what he could get that would stretch his one credit as far as possible. Ling took it from him. "Let me order for you. Charlie really is a number-one cook."

"But. . ."

"You are my guest. No, don't argue. I insist." Charlie showed up at that point, stepping silently through the booth's curtain. He and Ling exchanged remarks in a rapid singsong; he went away, returning shortly with crisp, hot egg rolls. The aroma was wonderful and Don's stomach put a stop to his protests.

The egg rolls were followed by a main dish which Don could not place. It was Chinese cooking but it certainly was not the chop suey of the trade. Don thought that he could identify Venerian vegetables out of his childhood in it but he could not be sure. Whatever it was, it was just what he needed; he began to feel a warm glow of content and ceased to be worried about anything.

While he ate he found that he was telling Ling his life history with emphasis on recent events that had landed him unexpectedly on Venus. The man was easy to talk to and it did not seem polite simply to sit, wolfing his host's food and saying nothing.

Ling sat back presently and wiped his mouth. "You've certainly had an odd time of it, Don. What are you going to do now?"

Don frowned. "I wish I knew. I've got to find a job of some sort and a place to sleep. After that I've got to scrape up, or save up, or borrow, enough money to send word to my folks. They'll be worried."

"You brought some money with you?"

"Huh? Oh, sure, but it's Federation money. I can't spend it."

"And Uncle Tom wouldn't change it for you. He's a flinty hearted old so-and-so in spite of his smiles. He's still a pawnbroker at bottom."

" 'Uncle Tom?' The banker is your uncle?"

"Eh? Oh, no, no—just a manner of speaking. He set up a hock shop here a long time ago. Prospectors would come in and pawn their Geiger counters. Next time out he'd grubstake 'em. Pretty soon he owned half the hot pits around here and was a banker. But we still call him 'Uncle Tom.' "

Don had a vague feeling that Ling was too anxious to deny the relationship but be did not pursue the thought as it did not matter to him. Ling was continuing, "You know, Don, the bank isn't the only place where you can change Federation money."

"What do you mean?"

Ling dipped his forefinger in a puddle of water on the table top and traced out the universal credit sign. "Of course, it's the only legal place. Would that worry you?"

"Well. . ."

"It isn't as if there were anything wrong about changing it. It's an arbitrary law and they didn't ask you when they passed it. After all, it's your money. That's right, isn't it?"

"I suppose so."

"It's your money and you can do what you please with it. But this talk is strictly on the quiet—you understand that?"

Don didn't say anything; Ling went on, "Now just speaking hypothetically—how much Federation money do you have?"

"Uh, about five hundred credits."

"Let's see it."

Don hesitated. Ling said sharply, "Come on. Don't you trust me? After all it's just so much waste paper."

Don got out his money. Ling looked at it and took out his wallet, started counting out bills. "Some of those big bills will be hard to move," he commented. "Suppose we say fifteen per cent." The money he laid down looked exactly like that Don had placed on the table except that each note had been overprinted with VENUS REPUBLIC.

Don did a rapid calculation. Fifteen per cent of what he had came to seventy-five credits, more or less—not even half what he needed to pay for a radiogram to Mars. He picked up his money and started putting it back into his wallet.

"What's the matter?"

"It's no use to me. I told you I needed a hundred eighty-seven fifty to pay for my radiogram."

"Well—twenty per cent. And I'm doing you a favor because you're a youngster in trouble."

Twenty per cent was still only a hundred credits. "No."

"Be reasonable! I can't move it at more than a point or two over that; I might take a loss. Commercial money draws eight per cent now, the way things are booming. This stuff has to go into hiding, losing eight per cent every year. If the war goes on very long, it's a net loss. What do you expect?"

Fiscal theory was over Don's head; he simply knew that anything less than the price of a message to Mars did not interest him. He shook his head.

Ling shrugged and gathered up his money. "It's your loss. Say, that's a handsome ring you're wearing."

"Thanks."

"How much money do you say you needed?"

Don repeated it. "You see, I've just got to get word to my family. I don't really need money for anything else; I can work."

"Mind if I look at that ring?"

Don did not want to pass it over but there seemed no way to avoid it without being rude. Ling slipped it on; it was quite loose on his bony finger. "Just my size. And it's got my initial, too."

"Huh?"

"My milk name, 'Henry.' I'll tell you, Don, I'd really like to help you out. Suppose we say twenty per cent on your money and I'll take the ring for the balance of what you need to send your 'gram. Okay?"

Don could not have told why he refused. But be was beginning to dislike Ling, beginning to regret being obligated to him for a meal. The sudden switch aroused his stubborn streak. "It's a family keepsake," he answered. "Not for sale."

"Eh? You're in no position to be sentimental. The ring is worth more here than it is on Earth—but I'm still offering you much more than it's worth. Don't be a fool!"

"I know you are," Don answered, "and I don't understand why you are. In any case the ring is not for sale. Give it back to me."

"And suppose I don't?"

Don took a deep breath. "Why then," he said slowly, "I suppose I'll have to fight you for it."

Ling looked at him for a moment, then took off the ring and dropped it on the table. He then walked out of the booth without saying anything more.

Don stared after him and tried to figure it out. He was still wondering when the curtain was pushed aside and the restaurant keeper came in. He dropped a chit on the table. "One and six," he said stolidly.

"Didn't Mr. Ling pay for it? He invited me to have dinner with him."

"One and six," Charlie repeated. "You ate. You pay."

Don stood up. "Where do you wash dishes around here? I might as well get started."

IX

"BONE" MONEY

BEFORE the evening was over the job of washing dishes for his dinner developed into a fixed arrangement. The salary was small—Don calculated that it would take him roughly forever to save enough money to send a radiogram to his parents—but it included three meals a day of Charlie's superlative cooking. Charlie himself seemed a very decent sort under his gruffness. He expressed a complicated and most disparaging opinion of Johnny Ling, using the same highly spiced lingua franca that he had used on the moveovers. He also denied any relationship to Ling while attributing to Ling other relationships which were on the face of them improbable.

After the last customer was gone and the last dish dried Charlie made up a pallet for Don on the floor of the back room in which Don had dined. As Don undressed and crawled into bed he remembered that he should have phoned the space port security office and told them his address. Tomorrow would do, he thought sleepily; anyhow the restaurant had no phone.

He woke up in darkness with a feeling of oppression. For a terrified moment he thought someone was holding him down and trying to rob him. As he came wider awake he realized where he was and what was causing the oppressed feeling—moveovers. There were two of them in bed with him; one was snuggled up to his back and was holding onto his shoulders; the other was cradled in his lap, spoon-fashion. Both were snoring gently. Someone had undoubtedly left a door open for a moment and they had sneaked in.

Don chuckled to himself. It was impossible to be angry with the affectionate little creatures. He scratched the one in front of him between its horns and said, "Look, kids, this is my bed. Now get out of here before I get tough."

They both bleated and snuggled closer. Don got up, got each of them by an ear and evicted them through the curtain. "Now stay out!"

They were back in bed before he was.

Don thought about it and gave up. The back room had no door that could be closed. As for chucking them outside the building, the place was dark and still strange to him and he was not sure of the locations of light switches. Nor did he want to wake Charlie. After all there was no harm in bedding down with a moveover; they were cleanly little things, no worse than having a dog curl up against one—better, for dogs harbor fleas. "Move over," he ordered, unintentionally renaming them, "and give me some room."

He did not go at once to sleep; the dream that had awakened him still troubled him. He sat up, fumbled in the dark, and found his money, which he tucked under him. He then remembered the ring, and, feeling somewhat foolish, he pulled on a sock and stuffed the ring far down into the sock.

Presently all three of them were snoring.

He was awakened by a frightened bleating in his ear. The next few moments were quite confused. He sat up, whispered, "Pipe down!" and started to smack his bedmate, when he felt his wrist grasped by a hand—not the thumbless little paw of a moveover, but a human hand.

He kicked out and connected with something. There was a grunt, more anguished bleating, and the click-click-click of little hooves on bare floor. He kicked again and almost broke his toe; the hand let go.

He backed away while getting to his feet. There were sounds of struggle near him and loud bleating. The sounds died down while he was still trying to peer through the darkness to find out what was happening. Then a light came on blindingly and he saw Charlie standing in the door, dressed in a wraparound and a big, shiny cleaver. "What's the matter with you?" Charlie demanded.

Don did his best to explain but moveovers, dreams, and clutching hands in the dark were badly mixed together. "You eat too much late at night," Charlie decided. Nevertheless he checked the place, with Don trailing after.

When he came to a window with a broken catch he did not say anything but went at once to the cash register and the lock box. Neither seemed to have been disturbed. Charlie nailed up the broken catch, shoved the moveovers back into the night, and said, "Go to sleep," to Don. He returned to his own room.

Don tried to do so but it was some time before he could quiet down. Both his money and the ring were still at hand. He put the ring back on his finger and went to sleep with his fist clenched.

Next morning Don had plenty of time to think as he coped with an unending stack of dirty dishes. The ring was on his mind. He was not wearing it; not only did he wish to avoid plunging it repeatedly into hot water but also was now reluctant to display it.

Could it be possible that the thief was after the ring rather than his money? It seemed impossible—a half-credit piece of souvenir counter junk! Or perhaps five credits, he corrected himself, here on Venus where every important item was expensive. Ten at the outside.

But he was beginning to wonder; too many people had taken an interest in it. He reviewed in his mind how he had come by it. On the face of it, Dr. Jefferson had risked death—had died—to make sure that the ring went to Mars. But that was preposterous and because it was he had concluded by what seemed to be strict logic that it must have been the paper in which the ring was wrapped that must reach his parents on Mars. That conclusion had been confirmed when the I.B.I. had searched him and confiscated the wrapping paper.

Suppose he did assume the wild possibility that it was the ring itself that was important? Even so, how could anyone here on Venus be looking for that ring? He had just landed; he had not even known that he was coming to Venus.

He might have thought of several ways that that news could have gone on before him, but he did not. Moreover, he found it difficult to imagine why anyone would take any special pains on his account.

But he had one quality in a high degree; he was stubborn. He swore a mighty oath into the dishwater that he and the ring, together, would travel to Mars and that he would deliver it to his father as Dr. Jefferson had asked him to.

Business slacked off a little in the middle of the afternoon; Don got caught up. He dried his hands and said to Charlie, "I want to go uptown for a while."

"What's a matter? You lazy?"

"We work tonight, don't we?"

"Sure we do. You think this is a tea room?" "Okay, I work mornings and evenings—so I take a little time off in the afternoon. You've got enough clean dishes to last you for hours."

Charlie shrugged and turned his hack. Don left.

He picked his way through the mud and the crowd back up the street to the I. T. & T. Building. The outer room held several customers but most of them were using the automatic phones or waiting outside the booths for a chance to do so. Isobel Costello was back of the desk and did not seem too busy, although she was chatting with a soldier. Don went to the far end of the desk and waited for her to he free.

Presently she brushed off the enterprising soldier and came to him. "Well, if it isn't my problem child! How are you making out, son? Get your money changed?"

"No, the bank wouldn't take it. I guess you had better give me back my 'gram."

"No hurry; Mars is still in conjunction. Maybe you'll strike it rich."

Don laughed ruefully. "Not likely!" He told her what he was doing and where.

She nodded. "You could do worse. Old Charlie is all right. But that's a rough part of town, Don. Be careful, especially after dark."

"I will be. Isobel, would you do me a favor?"

"If it's not impossible, illegal, or scandalous—yes."

Don fished the ring out of his pocket. "Would you take care of this for me? Keep it safe until I want it back?"

She took it, held it up to look at it. "Careful!" Don urged. "Keep it out of sight."

"Huh?"

"I don't want anyone to know you have it. Get it out of sight."

"Well—" She turned away; when she turned back the ring was gone. "What's the mystery, Don?"

"I wish I knew."

"Huh?"

"I can't tell you any more than that. I just want to keep that ring safe. Somebody is trying to get it away from me."

"But— Look, does it belong to you?"

"Yes. That's all I can tell you."

She searched his face. "All right, Don. I'll take care of it."

"Thanks."

"No trouble—I hope. Look—stop in again soon. I want you to meet the manager."

"Okay, I will."

She turned away to take care of a customer. Don waited around until a phone booth was free, then reported his address to the security office at the space port. That done, he returned to his dishes.

Around midnight, hundreds of dishes later, Charlie turned away the last customer and locked the front door. Together they ate a meal there had been no time for earlier, one with chopsticks, one with fork. Don found himself almost too tired to eat. "Charlie," he asked, "how did you run this place with no help?"

"Had two helpers. Both joined up. Boys don't want to work these days; all they think about is playing soldier."

"So I'm filling two jobs, eh? Better hire another boy, or I might join up, too."

"Work is good for you."

"Maybe. You certainly take your own advice; I've never seen anybody work as hard as you do."

Charlie leaned back and rolled a cigarette of the shaggy native "crazy weed." "While I work I think about how someday I go home. A little garden with a wall around it. A little bird to sing to me." He waved his hand through choking smoke at the dreary walls of the restaurant. "While I cook, I don't see this. I see my little garden."

"Oh."

"I save money to go home." He puffed furiously. "I go home—or my bones will."

Don understood him; he had heard of "bone money" in his childhood. All the immigrant Chinese planned to go home; too often it was only a package of bones that made the trip. The younger, Venus-born Chinese laughed at the idea; to them Venus was home and China only a much-gummed tale.

He decided to tell Charlie his own troubles and did so, omitting any mention of the ring and all connected with it. "So you see, I'm just as anxious to get to Mars as you are to go home to China."

"Mars is a long way off."

"Yes—but I've got to get there."

Charlie finished his cigarette and stood up. "You stick with Charlie. Work hard and I cut you in on the profits. Someday this war nonsense will be over—then we both go." He turned to go. "G'night."

"Good night." This time Don checked personally to see that no moveovers had managed to sneak in, then retired to his cubbyhole. He was asleep almost at once, to dream of climbing endless mountain ranges of dishes, with Mars somewhere beyond.

Don was lucky to have a cubbyhole in a cheap restaurant as a place to sleep; the city was bursting at its seams. Even before the political crisis which had turned it into the capital of a new nation, New London had been a busy place, market place for a million square miles of back country and principal space port of the planet. The de facto embargo on interplanetary shipping resulting from the outbreak of war with the mother planet might eventually starve the fat off the city but as yet the only effect had been to spill into the town grounded spacemen who prowled the streets and sampled what diversions the town offered.

The spacemen were hardly noticed; much more numerous were the politicians. On Governor's Island, separated from Main Island by a stagnant creek, the Estates General of the new republic was in session; nearby, in what had been the gubernatorial mansion, the Executive General, his chief of State, and the departmental ministers bickered with each other over office space and clerical help. Already a budding bureaucracy was spilling over onto Main Island, South Island, East Spit, and Tombstone Island, vying with each other for buildings and sending rents sky high. In the wake of the statesmen and elected officials—and much more numerous—were the small fry and hangers-on of government, clerks who worked and special assistants who did not, world savers, men with Messages, lobbyists for and lobbyists against, men who claimed to speak for the native dragons but had never gotten around to learning whistle speech, and dragons who were quite capable of speaking on their own behalf—and did.

Nevertheless Governor's Island did not sink under the load

North of the city on Buchanan Island another city was burgeoning training camps for the Middle Guard and the Ground Forces. It was protested bitterly in the Estates that the presence of training grounds at the national capital was an invitation to national suicide, as one H-bomb could wipe out both the government and most of the armed forces of Venus—nevertheless nothing had been done about it. It was argued that the men had to have some place for recreation; if the training grounds were moved out into the trackless bush, the men would desert and go back to their farms and mines.

Many had deserted. In the meantime New London swarmed with soldiery. The Two Worlds Dining Room was jammed from morning until night. Old Charlie left the range only to tend the cash register; Don's hands were raw from hot water and detergent. Between times he stoked the water boiler back of the shack, using oily Chika logs hauled in by a dragon known as "Daisy" (but male despite the chosen name). Electric water heating would have been cheaper; electric power was an almost costless byproduct of the atomic pile west of the city—but the equipment to use electric power was very expensive and almost unobtainable.

New London was full of such frontier contrasts. Its muddy, unpaved streets were lighted, here and there, by atomic power. Rocket-powered sky shuttles connected it with other human settlements but inside its own boundaries transportation was limited to shank's ponies and to the gondolas that served in lieu of taxis and tubes—some of these were powered, more moved by human muscle.

New London was ugly, uncomfortable, and unfinished, but it was stimulating. Don liked the gusty, brawling drive of the place, liked it much better than the hothouse lushness of New Chicago. It was as alive as a basketful of puppies, as vital as a punch in the jaw. There was a feeling in the air of new things about to happen, new hopes, new problems.

After a week in the restaurant Don felt almost as if he had been there all his life. Furthermore he was not unhappy at it. Oh, to be sure, the work was hard, and he still was determined to get to Mars—eventually—but in the meantime he slept well, ate well, and had his hands busy . . . and there were always the customers to talk and argue with—spacemen, guardsmen, smalltime politicians who could not afford the better restaurants. The place was a political debating club, city news desk, and rumor mill; the gossip swapped over Charlie's food was often tomorrow's headline in the New London Times.

Don kept up the precedent of a midafternoon break, even when he had no business to transact. If Isobel was not too busy, he would take her across the street for a coke; she was, as yet, his only friend outside the restaurant. On one such occasion she said, "No—come on inside. I want you to meet the manager."

"Eh?"

"About your 'gram."

"Oh, yes—I'd been meaning to, Isobel, but there's no point in it yet. I haven't got the money. I'm going to wait another week and hit Old Charlie for a loan. He can't replace me very easily; I think he'll come across to keep me in durance vile."

"That's no good—you ought to get a better job as soon as you can. Come on."

She opened the gate in the counter desk and led him into an office in the rear where she introduced him to a worried-looking middle-aged man. "This is Don Harvey, the young man I was telling you about."

The older man shook hands. "Oh, yes—something about a message to Mars, I think my daughter said."

Don turned to Isobel. "'Daughter'? You didn't tell me the manager was your father."

"You didn't ask me."

"But— Never mind. Glad to know you, sir."

"And you. Now about that message?"

"I don't know why Isobel brought me in here. I can't pay for it. All I have is Federation money."

Mr. Costello examined his nails and looked troubled. "Mr. Harvey, under the rules I am supposed to require cash payment for interplanetary traffic. I'd like to accept your Federation notes. But I can't; it's against the law." He stared at the ceiling. "Of course there is a black market in Federation money." Don grinned ruefully. "So I found out. But fifteen, or even twenty per cent, is too low a rate. I still couldn't pay for my 'gram."

"Twenty per cent! The going rate is sixty per cent."

"It is? I guess I must have looked like a sucker."

"Never mind. I was not going to suggest that you go to the black market. In the first place—Mr. Harvey, I am in the odd position of representing a Federation corporation which has not been expropriated, but I am loyal to the Republic. If you walked out of here and returned shortly with money of the Republic instead of Federation notes, I would simply call the police."

"Oh, Daddy, you wouldn't! "

"Quiet, Isobel. In the second place, it's not good for a young man to have such dealings." He paused. "But perhaps we can work something out. Your father would pay for this message, would he not?"

"Oh, certainly!"

"But I can't send it collect. Very well; write a draft on your father for the amount; I'll accept it as payment."

Instead of answering at once, Don thought about it. It seemed to be the same thing as sending a message collect which he was willing to do—but running up debts in his father's name and without his knowledge stuck in his craw. "See here, Mr. Costello, you couldn't cash such a draft any time soon in any case: why don't I just give you an I.O.U and pay it back as quickly as possible? Isn't that better?"

"Yes and no. Your personal note is simply a case of letting you have interplanetary service on credit—which is what the rules forbid. On the other hand, a draft on your father's commercial paper, equivalent to cash even if I can't cash it right away. A space lawyer's difference, granted—but it's the difference between what I can do and can't do with the corporation's affairs."

"Thanks," Don said slowly, "but I think I'll wait a while. I may be able to borrow the money elsewhere."

Mr. Costello looked from Don to Isobel, shrugged helplessly. "Oh, give me your I.O.U." he said snappishly. "Make it out to me, not to the company. You can pay me when you can." He looked again at his daughter who was smiling approval.

Don made out the note. When Isobel and he were out o earshot of her father, Don said, "That was a mighty generous thing for your father to do."

"Pooh!" she answered. "It just goes to show how far a doting father will go not to crimp his daughter's chances."

"Huh? What do you mean?"

She grinned at him. "Nothing. Nothing at all. Grandmother Isobel was pulling your leg. Don't take me. seriously."

He grinned back. "Then where should I take you? Across to the Dutchman's for a coke?"

"You've talked me into it."

When he got back to the restaurant he found, in addition to the inevitable stack of dishes, a heated discussion about the draft bill pending in the Estates General. He pricked up his ears; if conscription came, he was sure fodder for it and he wanted to beat them to it by enlisting in the High Guard. McMasters' advice about the "only way to get to Mars" stuck in his mind.

Most of the opinions seemed to favor a draft, nor could Don argue against it; it seemed reasonable to him even though he would be caught in it. One quiet little man heard the others out, then cleared his throat. "There will be no draft," he announced.

The last speaker, a copilot still wearing the triple globe on his collar, answered, "Huh? What do you know about it, Shorty?"

"Quite a bit. Let me introduce myself—Senator Ollendorf of CuiCui

Province. In the first place we don't need a draft; the nature of our dispute with the Federation is not such as to employ a large army. Secondly, our people are not of the temperament to put up with it. By the drastic process of selective immigration we have here on Venus a nation of hardy individualists almost anarchists. They don't take to forced service. Thirdly, the taxpayers will not support a mass army; we have more volunteers now than we can find money to pay for. Lastly, my colleagues and I are going to vote it down about three to one."

"Shorty," complained the copilot, "why did you bother with the first three reasons?"

"Just practicing the speech I mean to make tomorrow," apologized the Senator. "Now, sir, since you are so strong for the draft, pray tell why you haven't joined the High Guard? You are obviously qualified."

"Well, I'll tell you, just like you told me. First or firstly, I'm not a colonial, so it's not my war. Secondly, this is my first vacation since the time they grounded the Comet-class ships. And thirdly, I joined up yesterday and I'm drinking up my bounty money before reporting in. Does that satisfy you?"

"Completely, sir! May I buy you a drink?"

"Old Charlie doesn't serve anything but coffee—you ought to know that. Here, have a mug and tell us what's cooking over on Governor's Island. Give us the inside data."

Don kept his ears open and his mouth (usually) shut. Among other things he learned why the "war" was producing no military action—other than the destruction of Circum-Terra. It was not alone that a distance varying from about thirty million to better than one hundred, fifty million miles was, to say the least, awkwardly inconvenient for military communications; more important was the fear of retaliation which seemed to have produced a stalemate.

A sergeant technician of the Middle Guard outlined it to anyone who would listen: "Now they want to keep everybody up half the night with space raid alerts. Malarky! "

"Terra won't attack—the big boys that run the Federation know better. The war's over."

"Why do you figure they won't attack?" Don asked. "Seems to me we're sitting ducks here."

"Sure we are. One bomb and they blow this mudhole out of the swamp. Same for Buchanan. Same for CuiCui Town. What good does that do them?"

"I don't know, but I don't relish being Abombed."

"You won't be! Use your head. They knock out a few shopkeepers and a lot of politicians—and they don't touch the back country. Venus Republic is as strong as ever—because those three spots are the only targets fit to bomb on this whole fogbound world. Then what happens?"

"It's your story; you tell me."

"A dose of reprisal, that's what—with all those bombs Commodore Higgins snagged out of Circum-Terra. We've got some of their fastest ships and we'd have the juiciest targets in history to shoot at. Everything from Detroit to Bolivarsteel mills, power plants, factories. They won't risk pulling our nose when they know we're all set to kick them in the belly. Let's be logical!" The sergeant set down his cup and looked around triumphantly.

A quiet man at the end of the counter had been listening. Now he said softly, "Yes—but how do you know that the strong men in the Federation will use logic?"

The sergeant looked surprised. "Huh? Oh, come off it! The war's over, I tell you. We ought to go home. I've got forty acres of the best rice paddies on the planet; somebody's got to get the crop in. Instead I'm sitting around here, playing space raid drill. The government ought to do something."

X

"WHILE I WAS MUSING THE FIRE BURNED"

THE GOVERNMENT did do something; the draft act was passed the next day. Don heard about it at noon; as soon as the lunch hour rush was over he dried his hands and went uptown to the recruiting station. There was a queue in front of it; he joined its tail and waited.

Over an hour later he found himself facing a harried-looking warrant officer seated at a table. He shoved a form at Don. "Print your name. Sign at the bottom and thumb it. Then hold up your right hand."

"Just a minute," Don answered. "I want to enlist in the High Guard. This forms reads for the Ground Forces."

The officer swore mildly. "Everybody wants the High Guard. Listen, son, the quota for the High Guard was filled at nine o'clock this morning—now I'm not even accepting them for the waiting list."

"But I don't want the Ground Forces. I'm—I'm a spaceman."

The man swore again, not so mildly. "You don't look it. You last-minute patriots make me sick—trying to join the sky boys so you won't have to soldier in the mud. Go on home; when we want you we'll send for you—and it won't be for the High Guard. You'll be a duckfoot and like it."

"But. . ."

"Get out, I said."

Don got. When he reached the restaurant Old Charlie looked at the clock then at him. "You soldier boy now?"

"They wouldn't have me."

"Good thing. Get me up some cups."

He had time to think about it while bending over suds. Although not inclined to grieve over spilt milk Don could see now that Sergeant McMasters' advice had been shrewd; he had missed what was probably his only chance (slim as it might have been) to get to Mars. It seemed a vacuum-tight certainty that he would spend the war (months? years?) as a duckfoot in the Ground Forces — getting no nearer to Mars than opposition distance—say sixty, seventy million miles. Hardly shouting distance.

He thought about the possibility of claiming exemption on the basis of Terran citizenship—but discarded it at once. He had already claimed the right to come here as a citizen of Venus; blowing hot and cold from the same mouth did not suit him. His sympathies lay with Venus anyhow, no matter what the lawyers eventually decided about his nationality.

More than that, even if he could stomach making such a claim, he could not see himself behind wire in an enemy alien camp. There was such a camp, he knew, over on East Spit. Sit out the war there and let Isobel bring him packages on Sunday afternoons?

Don't kid yourself, Don, my boy—Isobel was fiercely patriotic; she'd drop you like a mud louse.

"What can't be cured must be endured"—Confucius or somebody. He was in it and that was that—he didn't feel too upset about it; the Federation didn't have any business throwing its weight around on Venus anyhow. Whose planet was it?

He was most anxious to get in touch with his parents and to let them know he had Dr. Jefferson's ring, even if he couldn't deliver it right away. He would have to get up to the I. T. & T. office and check —there might be communication today. Charlie ought to have a phone in this dump.

He remembered that he had one possible resource that he had not exploited—"Sir Isaac." He had sincerely intended to get in touch with his dragon friend as soon as he landed, but it had not proved to be easy: "Sir Isaac" had not landed at New London, nor had he been able to find out from the local office where he had landed. Probably at CuiCui Town or at Buchanan—or, possibly, since "Sir Isaac" was a V.I.P., the Middle Guard might have accommodated him with a special landing. He might be anywhere on a planet with more land surface than Earth.

Of course, such an important personage could be traced down—

but the first step would be to consult the Office of Aborigine Affairs over on Governor's Island. That meant a two-hour trip, what with a gondola ride both ways and the red tape he was sure to run into. He told himself that he just hadn't had time.

But now he must take time. "Sir Isaac" might be able to get him assigned, or transferred, to the High Guard, quotas or no. The government was extremely anxious to keep the dragons happy and friendly to the new regime. Mankind remained on Venus at the sufferance of the dragons; the politicians knew that.

He felt a little bit sheepish about resorting to political influence—but there were times when nothing else would work.

"Charlie."

"Huh?"

"Go easy on the spoons; I've got to go uptown again."

Charlie grunted grumpily; Don hung up his apron and left. Isobel was not on the desk at I.T.&T.; Don sent in his name via the clerk on duty and got in to see her father. Mr. Costello looked up as he came in and said, "I'm glad you came in, Mr. Harvey. I wanted to see you."

"My message got through?"

"No, I wanted to give you back your note."

"Huh? What's the matter?"

"I haven't been able to send your message and I don't know when I shall be able to send it. If it turns out later that it can be sent, I'll accept your note—or cash, if you have it."

Don had an unpleasant feeling that he was being given a polite brushoff. "Just a moment, sir. I understood that today was the earliest that communication could be expected. Won't conditions be better tomorrow—and still better the next day?"

"Yes, theoretically. But conditions were satisfactory today. There is no communication with Mars."

"But tomorrow?"

"I haven't made myself clear. We tried to signal Mars; we got no answer. So we used the radar check. The bounce came back right on schedule—two thousand two hundred and thirty-eight seconds, no chance of a ghost blip. So we know that the channel was satisfactory and that our signal was getting through. But Schiaparelli Station fails to answer —no communication."

"Out of order, maybe?"

"Most unlikely. It's a dual station. They depend on it for astrogation, you know. No, I'm afraid the answer is obvious."

"Yes?"

"The Federation forces have taken the station over for their own uses. We won't be able to communicate with Mars until they let us."

Don left the manager's office looking as glum as he felt. He ran into Isobel just coming into the building. "Don!"

"Oh—hi, Grandma."

She was excited and failed to notice his mood. "Don—I'm just back from Governor's Island. You know what? They're going to form a women's corps!"

"They are?"

"The bill is in committee now. I can't wait—I'll be in it, of course. I've already put my name in."

"You will be? Yes, I guess you would be." He thought about it and added, "I tried to join up this morning."

She threw her arms around his neck, much to the interest of customers in the lobby. "Don!" She untangled herself, to his blushing relief, and added, "Nobody really expected that of you, Don. After all, it's not your fight; your home is on Mars."

"Well, I don't know. Mars isn't exactly my home, either: And they didn't take me, they told me to wait for my draft call."

"Well—anyway, I'm proud of you."

He went back to the restaurant, feeling ashamed that he had not had the courage to tell her why he had tried to enlist and why he had been turned down. By the time he reached Charlie's place he had about decided to go again to the recruiting office the next day and let them swear him in as a duckfoot. He told himself that the severance of communication with Mars had cut off his last connection with his old life; he might as well accept this new life with both arms. It was better to volunteer than to be dragged.

On second thought he decided to go over to Governor's Island first and send some sort of message to "Sir Isaac"—no use staying in the Ground Forces if his friend could wangle a transfer to the High Guard. It was a dead cinch now that the High Guard would eventually send an expedition to Mars; he might as well be in it. He'd get to Mars yet!

On third thought he decided that it might be well to wait a day or two to hear from "Sir Isaac"; it would certainly be easier to get assigned to the Guard in the first place than to get a transfer later.

Yes, that was the sensible thing to do. Unfortunately it did not make him feel pleased with himself.

That night the Federation attacked.

The attack should not have happened, of course. The rice farmer sergeant had been perfectly right; the Federation could not afford to risk its own great cities to punish the villagers of Venus. He was right —from his viewpoint.

A rice farmer has one logic, men who live by and for power have another and entirely different logic. Their lives are built on tenuous assumptions, fragile as reputation; they cannot afford to ignore a challenge to their power—the Federation could not afford not to punish the insolent colonists.

The Valkyrie, orbiting Venus in free fall, flashed into radioactive gas without warning. The Adonis, in the same orbit a thousand miles astern, saw the explosion and reported it to PHQ at New London; then she, too, became an expanding ball of fire.

Don was awakened from work-drugged sleep by the ululation of sirens. He sat up in the dark, shook his head to clear it, and realized with leaping excitement what the sound was and what it meant. Then he told himself not to be silly; there had been talk lately of holding a night alert—that's what it was: practice.

But he got up and fumbled for the light switch, only to find that the power seemed to be off. He felt around for his clothes, got his right leg in his left trouser leg, tripped. Despite this he was practically dressed by the time a small flickering light came toward him. It was Charlie, carrying a candle in one hand and in the other his favorite cleaver, the one used both for business and social purposes.

The cyclic moan of the sirens continued. "What is it, Charlie?" asked Don. "Do you suppose we've actually been attacked?"

"More likely some dumbhead leaned against the switch."

"Could be. Tell you what—I'm going uptown and find out what's happening."

"Better you stay home."

"I won't be gone long."

In leaving he had to push his way through a crowd of moveovers, all bleating with fright and trying to crowd inside to be close to their friend Charlie. He got through and groped his way to the street, closely escorted by two moveovers who seemed to want to climb into his pockets.

The nights of Venus make the darkest night on Earth feel like twilight. The power seemed to be off all over town; until he turned into Buchanan Street Don could not have counted his own fingers without feeling them. Along Buchanan Street there was an occasional flicker of a lighter and a window or two with dim lights inside. Far up the street someone held a hand torch; Don set his sights on that.

The streets were crowded. He kept bumping into persons in the dark and hearing snatches of speech. "—completely destroyed." "It's a routine drill. I'm a space warden; I know." "Why turn off the lights? Their detectors can pick up the power pile in any case." "Hey—get off my feet!" Somewhere along the way he lost his escort; no doubt the gregarians found someone warmer to snuggle up to.

He stopped where the crowd was thickest, around the office of the New London TIMES. There were emergency lights inside by which it was possible to read the bulletins being pasted up in the window. At the top was: FLASH BULLETIN (UNOFFICIAL) CRUISER VALKYRIE REPORTED BY CRUISER ADONIS TO HAVE EXPLODED 0030 TONITE. CAUSE NOT REPORTED. LOCAL AUTHORITIES DISCOUNT ATTACK POSSIBILITY, FAVOR POSSIBLE SABOTAGE. FURTHER REPORT EXPECTED COMMANDING OFFICER ADONIS.

BERMUDA (INTERCEPTED) DISORDERS IN WEST AFRICA TERMED "MINOR INCIDENT" STIRRED UP BY RELIGIOUS AGITATORS. LOCAL POLICE ASSISTED BY FEDERATION PATROL HAVE SITUATION WELL IN HAND (IT IS CLAIMED).

BERMUDA (INTERCEPTED) A SOURCE CLOSE TO THE MINISTER OF EXTERNAL AFFAIRS STATES THAT AN EARLY SETTLEMENT OF THE VENUS INCIDENT IS EXPECTED. REPRESENTATIVES OF INSURGENT COLONISTS SAID TO BE CONFERRING WITH FEDERATION PLENIPOTENTIARIES SOMEWHERE ON LUNA IN AN ATMOSPHERE OF GOOD WILL AND MUTUAL UNDERSTANDING. (NOTE: THIS REPORT HAS BEEN UNOFFICIALLY DENIED FROM GOVERNOR'S ISLAND.)

NEW LONDON (PHQ-OFFICIAL) CHIEF OF STAFF CONFIRMED DAMAGE TO VALKYRIE BUT STATES EXTENT GREATLY EXAGGERATED. LIST OF CASUALTIES WITHHELD PENDING NOTIFICATION OF NEXT OF KIN. FULL REPORT FROM COMMANDING OFFICER ADONIS EXPECTED MOMENTARILY.

FLASH BULLETIN (UNOFFICIAL) CUICUI—UNIDENTIFIED SHIPS REPORTED RADAR-TRACKED TO LANDINGS NORTH AND NORTHWEST OF SETTLEMENT. LOCAL GARRISON ALERTED. PHQ REFUSES COMMENT. NO THIRTY, MORE COMING.

Don crowded up, managed to read the bulletins and listened to the talk. A faceless voice said, "They wouldn't land—that's as obsolete as a bayonet charge. If they actually have blitzed our ships—which I doubt

—they would simply hang in orbit and radio an ultimatum."

"But suppose they did?" someone objected.

"They won't. That bulletin—nerve warfare, that's all. There are traitors among us."

"That's no news."

A shadowy shape inside was posting a new bulletin. Don used his elbows and forced his way closer. FLASH—it read —PHQ (OFFICIAL) PUBLIC INFORMATION OFFICER GENERAL STAFF CONFIRMS REPORT THAT AN ATTACK HAS BEEN MADE ON SOME OF OUR SHIPS BY UNIDENTIFIED BUT PRESUMABLY FEDERATION FORCES. THE SITUATION IS FLUID BUT NOT CRITICAL. ALL CITIZENS ARE URGED TO REMAIN IN THEIR HOMES, AVOID PANIC AND LOOSE TALK, AND GIVE FULL COOPERATION TO LOCAL AUTHORITIES. MORE DETAILS MAY BE EXPECTED LATER IN THE DAY. REPEAT—STAY HOME AND COOPERATE.

A self-appointed crier up front read the bulletin in a loud voice. The crowd took it in silence. While he was reading the sirens died away and the street lights came on. The same voice which had complained of the blackout before now expostulated, "What do they want to turn on the lights for? That's simply inviting them to bomb us!"

No more bulletins showed up; Don backed out, intending to go to the I. T. & T. Building, not with the expectation of finding Isobel there at that hour but in hopes of picking up more news. He had not quite reached the building when he ran into a squad of M. P.'s, clearing the streets. They turned him back and dispersed the crowd at the newspaper office. As Don left the only person there was a dragon with his eyestalks pointed in several directions; he appeared to be reading all the bulletins at once. Don wanted to stop and ask him if be knew "Sir Isaac" and, if so, where his friend might be found, but an M. P. hustled him along. The squad made no attempt to send the dragon about his business; he was left in undisputed possession of the street.

Old Charlie was still up, seated at a table and smoking. His cleaver lay in front of him. Don told him what he had found out. "Charlie, do you think they will land?"

Charlie got up, went to a drawer and got out a whetstone, came back and commenced gently stroking the blade of his cleaver. "Can happen."

"What do you think we ought to do?"

"Go to bed."

"I'm not sleepy. What are you sharpening that thing for?"

"This is my restaurant." He held up the tool, balanced it. "And this is my country." He threw the blade; it turned over twice and chunked into a wood post across the room.

"Be careful with that! You might hurt somebody."

"You go to bed."

"But. . ."

"Get some sleep. Tomorrow you wish you had." He turned away and Don could get no more out of him. He gave up and went to his own cubbyhole, not intending to sleep but simply to think things over. For a long time after he lay down he could hear the soft swishing of stone on steel.

The sirens awoke him again; it was already light. He went out into the front room; Charlie was still there, standing over the range. "What's going on?"

"Breakfast." With one hand Charlie scooped a fried egg out of a pan, placed it on a slice of bread, while with the other hand he broke another egg into the grease. He slapped a second slice of bread over the egg and handed the sandwich to Don.

Don accepted it and took a large bite before replying, "Thanks. But what are they running the sirens for?"

"Fighting. Listen."

From somewhere in the distance came the muted WhaHoom! of an explosion; cutting through the end of it and much nearer was the dry sibilance of a needle beam. Mixed with the fog drifting in the window was a sharp smell of wood burning. "Say!" Don exclaimed, his voice high, "they really did it." Automatically, his mind no longer on food, his jaws clamped down on the sandwich.

Charlie grunted. Don went on, "We ought to get out of here."

"And go where?"

Don had no answer for that. He finished the sandwich while still watching out the window. The smell of smoke grew stronger. A half squad of men showed up at the end of the alley, moving at a dog trot. "Look! Those aren't our uniforms!"

"Of course not."

The group paused at the foot of the street, then three men detached themselves and came down the alley, stopping at each door to pound on it. "Outside! Wake up in there—outside, everybody!" Two of them reached the Two Worlds Dining Room; one of them kicked on the door. It came open. "Outside! We're going to set fire to the place."

The man who had spoken was wearing a mottled green uniform with two chevrons; in his hands was a Reynolds one-man gun and on his back the power pack that served it. He looked around. "Say, this is a break!" He turned to the other. "Joe, keep :in eye out for the lieutenant." He looked back at Old Charlie. "You, Jack—scramble up about a dozen eggs. Make it snappy—we got to burn this place right away."

Don was caught flatfooted, could think of nothing to do or say. A

Reynolds gun brooks no argument. Charlie appeared to feel the same way for he turned back to the range as if to comply.

Then he turned again toward the soldier and in his hand was his cleaver. Don could hardly follow what happened—a flash of blue steel through the air, a meaty, butcher-shop sound, and the cleaver was buried almost to its handle in the soldier's breastbone.

He uttered no cry; he simply looked mildly surprised, then squatted slowly where he stood, his hands still clasping the gun. When he reached the floor, his head bowed forward and the gun slipped from his grasp.

While this went on the other soldier stood still, his own gun at the ready. When his petty officer dropped his gun it seemed to act as a signal to him; he raised his own gun and shot Charlie full in the face. He swung and trained his gun on Don. Don found himself staring into the dark cavity of the projector.

XI

"YOU COULD GO BACK TO EARTH"

They stayed that way for three heart beats . . . then the soldier lowered his weapon about an inch and rapped out, "Outside! Fast!"

Don looked at the gun; the soldier gestured with it.

Don went outside. His heart was raging; he wanted to kill this soldier who had killed Old Charlie. It meant nothing to him that his boss had been killed strictly in accordance with the usages of warfare; Don was in no frame of mind to juggle legalisms. But he was naked against an overpowering weapon; he obeyed. Even as he left the soldier was fanning out with the Reynolds gun; Don heard the hiss as the beam struck dry wood.

The soldier put the torch to the building wastefully; it seemed almost to explode. It was burning in a dozen places as soon as Don was out the door. The soldier jumped out behind him and prodded him in the seat with the hot projector. "Get moving! Up the street." Don broke into a trot, ran out the alley and into Buchanan Street.

The street was filled with people, and green-suited soldiers were herding them uptown. Buildings were burning on both sides of the street; the invaders were destroying the whole city but giving the inhabitants some chance to escape the holocaust. As a part of a faceless mob Don found himself being pushed along and then forced into a side street which was not yet burning. Presently they were beyond the town but the road continued; Don had never been out in this direction but he learned from the talk around him where they were headed—out East Spit.

And into the fenced camp which the new government had used for enemy aliens. Most of the crowd seemed too stunned to care. Somewhere near Don a woman was screaming, her voice rising and falling like a siren.

The camp was crowded to more than ten times its capacity. The camp buildings did not provide standing room; even outdoors the colonists were elbow to elbow. The guards simply shoved them inside and ignored them; they stood there or milled around, while the soft gray ashes of their former homes drifted down on them from the misty sky.

Don had regained his grip on himself during the march out to the camp. Once inside, he tried to find Isobel Costello. He threaded his way through the crowd, searching, asking, peering at faces. More than once he thought he had found her, only to be disappointed—nor did he find her father. Several times he talked to persons who thought they had seen her; each time the clue failed to lead him to her. He began to have waking nightmares of his impetuous young friend dead in the fire, or lying in an alley with a hole in her head.

He was stopped in his weary search by an iron voice bellowing out of the air and reaching all parts of the camp through the camp's announcing system. "Attention!" it called out. "Quiet! Attention to orders—this is Colonel Vanistart of the Federation Peace Forces, speaking for the Military Governor of Venus. Conditional amnesty has been granted to all colonists with the exception of those holding office in the rebel government and commissioned officers in the rebel forces. You will be released as quickly as you can be identified. The code of laws in force before the rebellion is restored, subject to such new laws as may be promulgated by the military governor. Attention to Emergency Law Number One! The cities of New London, Buchanan, and CuiCui Town are abolished. Hereafter no community of more than one thousand population will be permitted. Not more than ten persons may assemble without license from the local provost. No military organization may be formed, nor may any colonist possess power weapons under penalty of death.'

The voice paused. Don heard someone behind him say, "But what do they expect us to do? We've no place to go, no way to live—"

The rhetorical question was answered at once. The voice went on, "No assistance will be furnished to dispersed rebels by the Federation. Relief to refugees must be provided by colonists who have not been dispossessed. When you are liberated you are advised to spread out into the surrounding countryside and seek temporary shelter with farmers and in the smaller villages."

A bitter voice said, "There's your answer, Clara—they don't give a hoot whether we live or die."

The first voice answered, "But how can we get away? We don't even own a gondola."

"Swim, I guess. Or walk on water."

Soldiers came inside and delivered them to the gate in groups of fifty, cutting them out like cowpunchers handling cattle. Don had pushed toward the gate, hoping to spot Isobel during the processing, and got picked up against his will in the second group. He produced his I. D.s when demanded and immediately ran into a hitch; his name did not appear in the city lists. He explained that he had come in on the last trip of the Nautilus.

"Why didn't you say so?" grumbled the soldier doing the checking. He turned and produced another list: "Hannegan. . . Hardecker . . . here it is: Harvey, Donald J.—Yikes! Wait a minute—it's flagged. Hey, sarge! This bird has a polit flag against his name."

"Inside with him," came the bored answer.

Don found himself shoved into the guardroom at the gate, along with a dozen other worried-looking citizens. Almost at once he was conducted on into a little office at the rear. A man who would have seemed tall had he not been so fat stood up and said, "Donald James Harvey?"

"That's right."

The man came to him and looked him over, his face wreathed in a happy grin. "Welcome, my boy, welcome! Am I glad to see you!"

Don looked puzzled. The man went on, "I suppose I should introduce myself—Stanley Bankfield, at your service. Political Officer First Class, I.B.I., at the moment special adviser to his excellency, the Governor."

At the mention of the I.B.I., Don stiffened. The man noticed it—his little fat-enfolded eyes seemed to notice everything. He said, "Easy, son! I mean you no harm; I'm simply delighted to see you. But I must say you have led me a merry chase—half around the system. At one point I thought you had been killed in the late lamented Glory Road, and I cried tears over your demise. Yes, sir! real tears. But that's over with, and all's well that ends well. So let's have it."

"Have what?"

"Come, now! I know all about you—almost every word you've uttered back to your babyhood. I've even fed sugar to your stock pony, Lazy. So hand it over."

"Hand what over?"

"The ring, the ring!" Bankfield put out a pudgy hand.

"I don't know what you are talking about."

Bankfield shrugged mightily. "I am talking about a plastic ring, marked with an initial 'H', given to you by the late Dr. Jefferson. You see, I know what I am talking about; I know you have it, and I mean to have it. An officer in my own service was so stupid as to let you walk out with it—and was broken for it. You wouldn't want that to happen to me, I'm sure. So give it to me."

"Now I know what ring you are talking about," Don answered, "but I don't have it."

"Eh? What's that you are saying? Where is it, then?"

Don's mind was racing ahead. It took him no time at all to decide not to set the I.B.I. to looking for Isobel—no, not if he had to bite his tongue out. "I suppose it's burned up," he answered.

Bankfield cocked his head on one side. "Donald, my boy, I believe you are fibbing to me—I do indeed! You hesitated just a teeny-weeny bit before you answered. No one but a suspicious old man like myself would have noticed it."

"It's true," Don insisted. "Or, at least, I think it is. One of those monkeys you have working for you set fire to the building just as I left. I suppose the building burnt down and the ring with it. But maybe it didn't."

Bankfield looked doubtful. "What building?"

"Two Worlds Dining Room, at the end of Paradise Alley off the foot of Buchanan Street."

Bankfield moved rapidly to the door, gave orders. "Use as many men as needed," he concluded, "and sift every ounce of ash. Move!" He turned back, sighing. "Mustn't neglect any possibilities," he said, "but now we will go back to the probability that you lied. Why should you have taken off your ring in a restaurant?"

"To wash dishes."

"Eh?"

"I was working for my meals, living there. I didn't like putting it in the hot water so I kept it in my room."

Bankfield pursed his lips. "You almost convince me. Your story holds together. And yet, let us both pray that you are deceiving me. If you are and can lead me to the ring, I would be very grateful. You could go back to Earth in style and comfort. I think I could even promise a moderate annuity; we have special funds for such purposes."

"I'm not likely to collect it—unless they find the ring in the restaurant."

"Dear me! In that case I don't suppose either one of us will go back to Earth. No, sir, I think that in such a case I would find it better to stay right here—devoting my declining years to making your life miserable."

He smiled. "I was joking—I'm sure we'll find the ring, with your help. Now, Don, tell me what you did with it." He put an arm around Don's shoulders in a fatherly fashion.

Don tried to shrug the arm off, found that he could not. Bankfield went on, "We could settle it quickly if I had proper equipment at hand. Or I could do this—" The arm around Don's shoulders dropped suddenly; Bankfield seized Don's left little finger and bent it back sharply. Involuntarily Don grunted with pain.

"Sorry! I don't like such methods. The operator, in an excess of zeal, frequently damages the client so that no truth of any sort is forthcoming. No, Don, I think we will wait a few minutes while I get word to the medical department—sodium pentothal seems to be indicated. It will make you more cooperative, don't you think?" Bankfield stepped again to the door. "Orderly! Put this one on ice. And send in that Mathewson character."

Don was conducted outside the guardhouse and into a pen, a fenced enclosure used to receive prisoners. It was some thirty feet wide and a hundred feet long; one of its longer sides was common with the fence that ran around the entire camp, the other shut it off from the free world. The only entrance to it lay through the guardhouse.

There were several dozen prisoners in the receiving pen, most of them civilian men, although Don saw a number of women and quite a few officers of the Middle Guard and of the Ground Forces—still in uniform but disarmed.

He at once checked the faces of the women; none was Isobel. He had not expected to find her, yet found himself vastly disappointed. His time was running out; he realized with panic that it was probably only minutes until he would be held down, drug injected into his veins—and be turned thereby into a babbling child with no will to resist their questioning. He had never been subjected to narco-interrogation but he knew quite well what the drug would do. Even deep-hypnotic suggestion could not protect against it in the hands of a skilled operator.

Somehow he felt sure that Bankfield was skilled.

He went to the far end of the pen, pointlessly, as a frightened animal will retreat to the back of a cage. He stood there, staring up at the top of the fence several feet above his head. The fence was tight and strong, proof against almost anything but a dragon, but one could get handholds in the mesh—it could be climbed. However, above the mesh were three single strands of wire; every ten feet or so on the lowest strand was a little red sign—a skull-and-crossbones and the words HIGH VOLTAGE.

Don glanced back over his shoulder. The everpresent fog, reinforced by smoke from the burning city, almost obscured the guardhouse. The breeze had shifted and the smoke was getting thicker; he felt reasonably sure that no one could see him but other prisoners.

He tried it, found that his shoes would not go into the mesh, kicked them off and tried again.

"Don't!" said a voice behind him.

Don looked back. A major of the Ground Forces, cap missing and one sleeve torn and bloody, stood behind him. "Don't try it," the major said reasonably. "It will kill you quickly. I know; I supervised its installation."

Don dropped to the ground. "Isn't there some way to switch it off?"

"Certainly—outside." The officer grinned wryly. "I took care of that. A locked switch in the guardhouse—and another at the main distribution board in the city. Nowhere else." He coughed. "Pardon me—the smoke."

Don looked toward the burning city. "The distribution board back in the powerhouse," he said softly. "I wonder—"

"Eh?" The major followed his glance. "I don't know—I couldn't say. The powerhouse is fireproof."

A voice behind them in the mist shouted, "Harvey! Donald J. Harvey! Front and center!"

Don swarmed up the fence.

He hesitated just before touching the lowest of the three strands, flipped it with the back of his hand. Nothing happened—then he was over and falling. He hit badly, hurting a wrist, but scrambled to his feet and ran.

There were shouts behind him; without stopping he risked a look over his shoulder. Someone else was at the top of the fence. Even as he looked he heard the hiss of a beam. The figure jerked and contracted, like a fly touched by flame.

The figure raised its head. Don heard the major's voice in a clear triumphant baritone: "Venus and Freedom!" He fell back inside the fence.

XII

WET DESERT

Don plunged ahead, not knowing where he was going, not caring as long as it was away. Again he heard the angry, deadly hissing; he cut to the left and ran faster, then cut back again beyond a clump of witch's brooms. He pounded ahead, giving it all he had, with his breath like dry steam in his throat—then skidded to a stop at water's edge.

He stood still for a moment, looked and listened. Nothing to see but grey mist, nothing to hear but the throbbing of his own heart. No, not quite nothing—someone shouted in the distance and he heard the sounds of booted feet crashing through the brush. It seemed to come from the right; he turned left and trotted along the waterfront, his eyes open for a gondola, a skiff, anything that would float.

The bank curled back to the left; he followed it, then stopped as he realized that it was leading him to the narrow neck of land that joined Main Island to East Spit. It was a cinch, he thought, that there would be a guard at the bottleneck; it seemed to him that there had been one there when he and the other dispossessed had been herded across it to the prison camp.

He listened—yes, they were still behind him—and flanking him. There was nothing in front of him but the bank curving back to certain capture.

For a moment his face was contorted in an agony of frustration, then his features suddenly relaxed to serenity and he stepped firmly into the water and walked away from the land.

Don could swim, in which respect he differed from most Venus colonials. On Venus no one ever swims; there is no water fit to swim in. Venus has no moon to pile up tides; the solar tide disturbs her waters but little. The waters never freeze, never approach the critical 4° C. which causes terrestrial lakes and streams and ponds to turn over and "ventilate." The planet is almost free of weather in the boisterous sense. Her waters lie placid on their surface—and accumulate vileness underneath, by the year, by the generation, by the eon.

Don walked straight out, trying not to think of the black and sulphurous muck he was treading in. The water was shallow; fifty yards out with the shore line dim behind him, he was still in only up to his knees. He glanced back and decided to go out farther; if he could not see the shore, then they could not see him. He reminded himself that he would have to keep his wits about him not to get turned around.

Presently the bottom suddenly dropped away a foot or more; he stepped off the edge; lost his balance and thrashed around; recovered himself and scrambled back up on the ledge, congratulating himself that he had not gotten his face and eyes into the stuff.

He heard a shout and almost at once the sound of water striking a hot stove, enormously amplified. Ten feet away from him a cloud of steam lifted from the water's surface, climbed lazily into the mist. He cringed and wanted to dodge, but there was no way to dodge. The shouting resumed and the sounds carried clearly across the water muffled by the fog but still plain: "Over here! Over here! He's taken to the water."

Much more distantly he heard the answer: "Coming!"

Most cautiously Don moved forward, felt the edge of the drop off, tried it and found that he could still stand beyond it, almost up to his armpits but still wading. He was moving, forward slowly, trying to avoid noise and minding his precarious, half-floating balance, when he heard the sibilant sound of the beam.

The soldier back on the bank had imagination; instead of firing again at random into the drifting mist he was fanning the flat surface of the water, doing his best to keep his beam horizontal and playing it like a hose. Don squatted down until his face alone was out of the water.

The beam passed only inches over his head; he could hear it pass, smell the ozone.

The hissing stopped abruptly to be followed by the age-old, monotonous cursing of the barrackroom. "But, sergeant—" someone protested.

"I'll 'sergeant' you! Alive—do you hear? You heard the orders. If you've killed him, I'll take you apart with a rusty knife. No, I won't; I'll turn you over to Mr. Bankfield. You hopeless fool!"

"But, sergeant, he was escaping by water; I had to stop him."

" 'But sergeant!' 'But sergeant!'—is that all you can say! Get a boat! Get a snooper! Get a two-station portable bounce rig. Call base and find out if they've got a copter down."

"Where would I get a boat?"

"Get one! He can't get away. We'll find him—or his body. If it's his body, you'd better cut your throat."

Don listened, then moved silently forward—or away from the direction the voices seemed to come from. He could no longer tell true direction; there was nothing but the black surface of water and a horizon of mist. For some distance the bottom continued fairly level, then he realized that it was again dropping away. He was forced to stop, able to wade no further.

He thought it over, trying to avoid panic. He was still close to Main Island with nothing but mist between himself and the shore. It was a certainty that with proper search gear—infrared or any of the appropriate offspring of radar—they could pin him like a beetle to cork. It was merely a matter of waiting for the gear to be brought up.

Should he surrender now and get out of this poisonous swill? Surrender and go back and tell Bankfield to find Isobel Costello if he wanted the ring? He let himself sink forward and struck out strongly, swimming breast stroke to try to keep his face out of the water.

Breast stroke was far from being his strongest stroke and it was made worse by trying so hard to keep his face dry. His neck began to ache presently the ache spread through his shoulder muscles and into his back. Indefinite time and endless gallons later he ached everywhere, even to his eyeballs—yet for all he could tell about it he might have been swimming in a bathtub, one whose walls were grey mist. It did not seem possible that, in the archipelago which made up Buchanan Province, one could swim so far without running into something . . . a sand spit, a mud bar.

He stopped to tread water, barely moving his tired legs and fluttering his palms. He thought he heard the rushing sound of a powered boat, but he could not be sure. At that moment he would not have cared; capture would have been relief. But the sound, or ghost of a sound, died away and he was again in a grey and featureless wilderness.

He arched his back to shift again to swimming and his toe struck bottom. Gingerly he felt for it—yes, bottom . . . with his chin out of water. He stood for a moment or two and rested, then felt around. Bottom dropped away on one side, seemed level or even to rise a little in another direction.

Shortly his shoulders were out with his feet still in the muck. Feeling his way like a blind man, his eyes useless save for balancing, he groped out the contour, finding bits that rose, then forced to retreat as the vein played out.

He was out of water to his waist when his eyes spotted a darker streak through the fog; he went toward it, was again up to his neck. Then the bottom rose rapidly; a few moments later he scrambled up on dry land.

He did not have the courage yet to do anything more than move inland a few feet and place between himself and the water a clump of Chika trees. Screened thus from search operations conducted from boats he looked himself over. Clinging to his legs were a dozen or more mud lice, each as large as a child's hand. With repugnance he brushed them off, then removed his shorts and shirt, found several more and disposed of them. He told himself that he was lucky not to have encountered anything worse—the dragons had many evolutionary cousins, bearing much the same relationship to them that gorillas do to men. Many of these creatures are amphibious—another reason why Venus colonials do not swim.

Reluctantly Don put his wet and filthy clothes back on, sat down with his back to a tree trunk, and rested. He was still doing so when he again heard the sound of a power boat; this time there was no mistaking it. He sat still, depending on the trees to cover him and hoping that it would go away.

It came in close to shore and cruised along it to his right. He was beginning to feel relief when the turbine stopped. In the stillness he could hear voices. "We'll have to reconnoiter this hunk of mud. Okay, Curly—you and Joe."

"What does this guy look like, corporal?"

"Now, I'll tell you—the captain didn't say. He's a young fellow, though, about your age. You just arrest anything that walks. He's not armed."

"I wish I was back in Birmingham."

"Get going."

Don got going, too — in the other direction, as fast and as silently as possible. The island was fairly well covered; he hoped that it was large as well—a precarious game of hide-and-seek was all the tactics he could think of. He had covered perhaps a hundred yards when he was scared out of his wits by movement up ahead; he realized with desperation that the boat party might have landed two patrols.

His panic died down when he discovered that what he was seeing were not men but gregarians. They spotted him, too, and came dancing up, bleating welcome, and crowding up against him.

"Quiet!" he said in a sharp whisper. "You'll get me caughtl"

The moveovers paid no attention to that; they wanted to play. He endeavored to pay no attention to them but moved forward again, closely accompanied by the whole group, some five. He was still wondering how to keep from being loved to death—or at least back into captivity—when they came out into the clearing.

Here was the rest of the herd, more than two hundred head, from babies that butted against his knees up to the grey-bearded old patriarch, fat in the belly and reaching as high as Don's shoulder. They all welcomed him and wanted him to stay a while.

One thing that had worried him was now cleared up—he had not swum in a circle and blundered back onto Main Island. The only moveovers on Main Island were half-domesticated scavengers such as those which had hung around the restaurant; there were no herds.

It suddenly occurred to him that it was barely possible that he might turn the ubiquitous friendliness of the bipeds into an advantage rather than a sure giveaway. They would not let him be; that was sure. If he left the herd, some of them were certain to trail along, bleating and snorting and making themselves and him conspicuous. On the other hand. . .

He moved straight out into the clearing, pushing his friends aside as he went. He shoved himself right into the center of the herd and sat down on the ground.

Three of the babies promptly climbed into his lap. He let them stay. Adults and half-grown bucks crowded around him bleating and snuffling and trying to nuzzle the top of his head. He let them—he was now surrounded by a wall of flesh. From time to time one of the inner circle would be shouldered out of the way and would go back to grazing but there were always enough around him to block out his view of his surroundings. He waited.

After a considerable time he heard more excited bleating from the fringe of the herd. For a moment be thought his personal guard would be seduced away by this new excitement, but the inner circle preferred to keep their privileged positions the wall held. Again he heard voices.

"For Pete's sake—it's a whole flock of those silly billies!" Then —"Hey! Get down! Quit licking my face!"

Carly's voice replied, "I think he's fallen in love with you, Joe. Say —Soapy said to arrest anything that walks: shall we take this one back to him?"

"Stow it!" There were sounds of scuffling, then the high bleating of a moveover both surprised and hurt.

"Maybe we ought to burn one and take it back anyway,'" Curly went on. "I hear they are mighty tasty eating."

"You turn this into a hunting party and Soapy will haul you up before the Old Man. Come on—we got work to do."

Don could follow their progress around the edge of the herd. He could even tell by the sounds when the two soldiers managed to cuff and kick the most persistent of the creatures off their trail. He continued to sit there long after they were gone, tickling the chin of a baby which had gone to sleep in his lap, and resting himself.

Presently it began to grow dark. The herd started to bed down for the night. By the time it was fully dark they were all lying down except the sentries around the edge. Because he was dead tired and completely lacking in any plan of action Don bedded down with them, his head cradled on a soft and velvety back and himself in turn half supporting a couple of youngsters.

For a while he thought about his predicament, then he thought about nothing.

The herd stirred and he awakened. There was much snorting and stomping mixed with the whimpering complaints of the young, still not fully awake. Don got his bearings and got to his own feet; he knew vaguely what to expect—the herd was about to migrate. Gregarians rarely grazed the same island two days in a row. They slept the first part of the night, then moved out before dawn when their natural enemies were least active. They forded from one island to another, using paths through the water known—possibly by instinct—to the herd leaders. For that matter, gregarians could swim, but they rarely did so.

Don thought: well, I'll soon be rid of them. Nice people, but too much is too much. Then he thought better of it—if the moveovers were moving to another island it was sure that it would not be Main Island and it would certainly have to be farther away from Main

Island than was this one. What could he lose?

He felt a bit lightheaded but the logic seemed right; when the herd moved out he worked his way up near the van. The leader took them down the island about a quarter of a mile, then stepped off into the water. It was still so nearly pitch dark that Don was not aware of it until he too stepped into it. It was only up to his ankles and did not get much deeper. Don splashed along almost at a dogtrot, trying to stay inside the body of the herd so that he would run no chances of blundering into deeper water in the darkness. He hoped that this was not one of the migrations involving swimming.

It began to grow truly light and the pace quickened; Don was hard put to keep up. At one point the old buck in the lead stopped, snorted, and made a sharp turn; Don could not guess why he had turned, for the morning mist was very thick and one piece of water looked exactly like another. Yet the way chosen turned out to be shallow. They followed it for another kilometer or more, twisting and turning at times, then at last the leader clambered up a bank with Don on his heels.

Don threw himself down, exhausted. The old buck stopped, plainly puzzled, while the herd gained the land and crowded around them. The leader snorted and looked disgusted, then turned away and continued his duty of leading his people to good pasture. Don pulled himself together and followed them.

They were just coming out of the trees that hedged the shore when Don saw a fence off to the right. He felt like singing. "So long, folksl" he called out. "Here's where I get off." He headed for the fence, while the main herd moved on. When he reached the fence he reluctantly slapped and swatted his attendants until he managed to shoo them off, then headed along the wire. Eventually, he told himself, I will find a gate and that will lead me to people. It did not matter much who the people were; they would feed him and let him rest and help him to hide from the invaders.

The fog was very thick; it was good to have the fence to guide him. He stumbled along by it, feeling feverish and somewhat confused, but cheerful.

"Halt."

Don froze automatically, shook his head and tried to remember where he was.

"I've got you spotted," the voice went on. "Move forward slowly with your hands up."

Don strained his eyes to see through the fog, wondered if he dared to run for it. But, with a feeling of utter and final defeat, he realized that he had run as far as he could.

XIII

FOGEATERS

"SNAP out of it!" the voice said, "or I shoot."

"Okay," he answered dully and moved forward with his hands over his head. A few paces advance let him see a man's shape; a few more and he made out a soldier with a hand gun trained on him. His eyes were covered by snooper goggles, making him look like some bug-eyed improbability from another planet.

The soldier halted Don again a few steps from him, made him turn around slowly. When Don turned back he had shoved the snoopers up on his forehead, revealing pleasant blue eyes. He lowered his gun. "Jack, you're sure a mess," he commented. "What in the name of the Egg have you been doing?"

It was only then that Don realized that the soldier was wearing not the mottled green of the Federation but the tans of the Ground Forces of Venus Republic.

The soldier's commanding officer, a Lieutenant Busby, tried to question him in the kitchen of the farm house inside the fence, but he saw very quickly that the prisoner was in no shape to be questioned. He turned Don over to the farmer's wife for food, a hot bath, and emergency medical attention. It was late that afternoon that Don, much refreshed and with the patches left by the mud lice covered with poultices, finally gave an account of himself.

Busby listened him out and nodded. "I'll take your word for it, mainly because it is almost inconceivable that a Federation spy could have been where you were, dressed the way you were, and in the shape you were in." He went on to question him closely about what he had seen in New London, how many soldiers there seemed to be, how they were armed, and so forth. Unfortunately Don could not tell him much. He did recite "Emergency Law Number One" as closely as he could remember it.

Busby nodded, "We got it over Mr. Wong's radio." He hooked a thumb at the corner of the room. He thought for a moment. "They played it smart; they took a leaf from Commodore Higgins' book and played it real smart. They didn't bomb our cities; they just bombed our ships—then they moved in and burned us out."

"Have we got any ships left?" Don asked.

"I don't know. I doubt it—but it doesn't matter."

"Huh?"

"Because they played it too smart. There's nothing left they can do to us; from here on they're fighting the fog. And we fogeaters know this planet better than they do."

Don was allowed to rest up the balance of that day and the following night. By listening to the gossip of the soldiers he came to the conclusion that Busby was not simply an optimist; the situation was not completely hopeless. It was admittedly very bad; so far as anyone knew all the ships of the High Guard had been destroyed. The Valkyrie, the Nautilus and the Adonis were reported bombed and with them Commodore Higgins and most of his men. There was no word of the Spring Tide—which meant nothing; what little information they had was compounded of equal parts rumor and Federation official propaganda.

The Middle Guard might have saved some of their ships, might have them hidden out in the bush, but the usefulness at this time of superstratospheric shuttles which required unmovable launching catapults was conjectural. As for the Ground Forces a good half of them had been captured or killed at Buchanan Island Base and at lesser garrisons. While the enlisted survivors were being released, the only officers still free were such as Lieutenant Busby, those who had been on detached duty when the attack came. Busby's unit had been manning a radar station outside New London; he had saved his command by abandoning the now useless station.

The civil government of the baby republic was, of course, gone; almost every official had been captured. The command organization of the armed forces was equally out of action, captured in the initial attack. This raised a point that puzzled Don; Busby did not act as if his commanding generals were missing; he continued to behave as if he were a unit commander of an active military organization, with task and function clearly defined. Esprit de corps was high among his men; they seemed to expect months, perhaps years of bush warfare, harrying and raiding the Federation forces, but eventual victory at the end.

As one of them put it to Don, "They can't catch us. We know these swamps; they don't. They won't be able to go ten miles from the city, even with boat radar and deadreckoning bugs. We'll sneak in at night and cut their throats —and sneak out again for breakfast. We won't let them lift a ton of radioactive off this planet, nor an ounce of drugs. We'll make it so expensive in money and men that they'll get sick of it and go home."

Don nodded. "Sick of fighting the fog, as Lieutenant Busby puts it."

"Busby?"

"Huh? Lieutenant Busby—your C. O."

"Is that his name? I didn't catch it." Don's face showed bewilderment. The soldier went on, "I've only been here since morning, you see. I was turned loose with the other duckfeet from the Base and was dragging my tail back home, feeling lower than swamp muck. I stopped off here, meaning to cadge a meal from Wong, and found the Lieutenant here—Busby, did you say? with a going concern. He attached me and put me back on duty. I tell you, it put the heart back into me. Got a light on you?"

Before he turned in that night—in Mr. Wong's barn, with two dozen soldiers—Don had found that most of those present were not of Busby's original detail, which had consisted of only five men, all electronics technicians. The rest were stragglers, now formed into a guerilla platoon. As yet few of them had arms; they made up for that in restored morale.

Before he went to sleep Don had made up his mind. He would have looked up Lieutenant Busby at once but decided that it would not do to disturb the officer so late at night. He woke up next morning to find the soldiers gone. He rushed out, found Mrs. Wong feeding her chickens, and was directed by her down to the waterfront. There Busby was superintending the moving out of his command. Don rushed up to him. "Lieutenant! May I have a word with you?"

Busby turned impatiently. "I'm busy."

"Just a single moment—please!"

"Well, speak up."

"Just this—where can I go to enlist?" Busby frowned; Don raced ahead with explanation, insisting that he had been trying to join up when the attack came.

"If you meant to enlist, I should think you would have done so long ago. Anyway, by your own story you've lived a major portion of your life on Earth. You're not one of us."

"Yes, I am!"

"I think you're a kid with your head stuffed with romantic notions. You're not old enough to vote."

"I'm old enough to fight."

"What can you do?"

"Uh, well, I'm a pretty good shot, with a hand gun anyway."

"What else?"

Don thought rapidly; it had not occurred to him that soldiers were expected to have anything more than willingness. Ride horseback? It meant nothing here. "Uh, I talk 'true speech' fairly well."

"That's useful—we need men who can palaver with the dragons. What else?"

Don thought about the fact that he had been able to make his escape through the bush without disaster—but the Lieutenant knew that; it simply proved that he was truly a fogeater in spite of his mixed background. He decided that Busby would not be interested in the details of his ranch school education. "Well, I can wash dishes."

Busby grudged a faint smile. "That is unquestionably a soldierly virtue. Nevertheless, Harvey, I doubt if you're suited. This won't be parade-ground soldiering. We'll live off the country and probably never get paid at all. It means going hungry, going dirty, always on the move. You not only risk being killed in action; if you are captured, you'll be burned for treason."

"Yes, sir. I figured that out last night."

"And you still want to join?"

"Yes, sir."

"Hold up your right hand."

Don did so. Busby continued. "Do you solemnly swear to uphold and defend the Constitution of the Venus Republic against all enemies, domestic and foreign; and to serve faithfully in the armed forces of the Republic for the duration of this emergency unless sooner discharged by competent authority; and to obey the lawful orders of superior officers placed over you?"

Don took a deep breath. "I do."

"Very well, soldier—get in the boat."

"Yes, sirl"

There were many, many times thereafter that Don regretted having enlisted—but so has every man who ever volunteered for military service. More of the time he was reasonably content, though he would have denied this sincerely—he acquired considerable talent at the most common of soldiers' pastimes, griping about the war, the weather, the food, the mud, the stupidities of high command. The old soldier can substitute for recreation, or even for rest or food, this ancient, conventional, and harmless form of literary art.

He learned the ways of the guerilla—to infiltrate without a sound, to strike silently, and to fade back into the dark and the mist before the alarm can be raised. Those who learned it lived; those who did not, died. Don lived. He learned other things—to sleep for ten minutes when opportunity offered, to come fully and quietly awake at a touch or a sound, to do without sleep for a night, or two nights—or even three. He acquired deep lines around his mouth, lines beyond his years, and a white, puckered scar on his left forearm.

He did not stay long with Busby but was transferred to a company of gondola infantry operating between CuiCui and New London. They called themselves proudly "Marsten's Raiders"; he was assigned as "true speech" interpreter for his outfit. While most colonials can whistle a few phrases of dragon talk—or, more usually, can understand a bit of a pidgin sufficient for buying and selling—few of them can converse freely in it. Don, for all his lack of practice during his years on Earth, had been taught it young and taught it well by a dragon who had taken an interest in him as a child. And both his parents used it as easily as they did Basic English; Don had been drilled in it by daily use at home until he was eleven.

The dragons were of great use to the resistance fighters; while not belligerents themselves, their sympathies lay with the colonials—more accurately, they despised the Federation soldiers. The colonials had managed to make a home on Venus through getting along with the dragons—an enlightened self-interest policy instituted by Cyrus Buchanan himself. To a human born on Venus there was never any doubt that there existed another race—dragons—as intelligent, as wealthy, and as civilized as their own. But to the great majority of the Federation soldiers, new to the planet, the dragons were merely ugly, uncouth animals, incapable of speech and giving themselves airs, arrogating to themselves privileges that no animal had a right to claim.

This orientation cut below the conscious level; no general order issued to the Federation troops, no amount of disciplinary action for violations, could cope with it. It was stronger and less reasoned than any analogous Earthly trouble—white versus black, gentile versus Jew, Roman versus barbarian, or whatever—had ever been. The very officers issuing the orders could not feel the matter correctly; they were not Venus born. Even the governor's prime political adviser, the shrewd and able Stanley Bankfield, could not really grasp that one does not ingratiate oneself with a dragon by (so to speak) patting him on the head and talking down.

Two serious incidents had set the pattern on the very day of the original attack; in New London a dragon—the same one Don had seen reading the Times' bulletins had been, not killed, but seriously damaged by a flamethrower; he had been silent partner in the local bank and lessor of many ichthorium pits. Still worse, in CuiCui a dragon had been killed by a rocket; through mischance he had had his mouth open. And this dragon had been related collaterally to the descendants of the Great Egg.

It does not do to antagonize highly intelligent creatures each of whom is physically equivalent to, say three rhinoceri or a medium tank. Nevertheless they were not themselves belligerents, as our convention of warfare is not part of their culture. They work in different ways to their ends.

When in the course of his duties Don had to speak to dragons he sometimes inquired whether or not this particular citizen or the dragon nation knew his friend "Sir Isaac" using, of course, "Sir Isaac's true name. He found that those who could not claim personal acquaintance at least knew of him; he found, too, that it raised his own prestige to claim acquaintanceship. But he did not attempt to send a message to "Sir Isaac"; there was no longer any occasion for it —no need to try to wangle a transfer to a High Guard that no longer existed.

He did try and try repeatedly to learn what had happened to Isobel Costello—through refugees, through dragons, and through the increasingly numerous clandestine resistance fighters who could move fairly freely from one side to the other. He never found her. He heard once that she was confined in the prison camp on East Spit; he heard again that she and her father had been deported to Earth—neither rumor could be confirmed. He suspected, with a dull, sick feeling inside, that she had been killed in the original attack.

He was grieved about Isobel herself—not about the ring that he had left with her. He had tried to guess what it could possibly be about the ring, which would cause him to be chased from planet to planet. He could not think of an answer and concluded that Bankfield, for all his superior airs, had been mistaken; the important thing must have been the wrapping paper but the I.B.I. had been too stupid to figure it out. Then he quit thinking about it at all; the ring was gone and that was that.

As for his parents and Mars — sure, sure, someday! Someday when the war was over and ships were running again—in the meantime why let the worry mice gnaw at one's mind?

His company was at this time spread out through four islands south-southwest of New London; they had been camped there for three days, about the longest they ever stayed in one place. Don, being attached to headquarters, was on the same island as Captain Marsten and was, at the moment, stretched out in his hammock, which he had slung between two trees in the midst of a clump of broom.

The company headquarters runner sought him out and awakened him—by standing well clear and giving the hammock rope a sharp tap. Don came instantly awake, a knife in his hand. "Easy!" cautioned the runner. "The Old Man wants to see you."

Don made a rhetorical and most ungracious suggestion as to what the Captain could do about it and slid silently to his feet. He stopped to roll up the hammock and stuff it into his pocket—it weighed only four ounces and had cost the Federation a nice piece of change on cost-plus contract. Don was very careful of it; its former owner had not been careful and now had no further need for it. He gathered up his weapons as well.

The company commander was sitting at a field desk under a screen of boughs. Don slid into his presence and waited. Marsten looked up and said, "Got a special job for you, Harvey. You move out at once."

"Change in the plan?"

"No, you won't be on tonight's raid. A high mugamug among the dragons wants palaver. You're to go to see him. At once."

Don thought it over. "Cripes, Skipper, I was looking forward to tonight's scramble. I'll go tomorrow—those people don't care about time; they're patient."

"That'll do, soldier. I'm putting you on leave status; according to the despatch from HQ, you may be gone quite a while."

Don looked up sharply. "If I'm ordered to go, it's not leave; it's detached duty."

"You're a mess hall lawyer at heart, Harvey."

"Yes, sir."

"Turn in your weapons and take off your insignia; you'll make the first leg of the trip as a jolly farmer boy. Pick up some props from stores. Larsen will boat you. That's all."

"Yes sir." Don tamed to go, adding, "Good hunting tonight, Skipper."

Marsten smiled for the first time. "Thanks, Don."

The first part of the trip was made through channels so narrow and devious that electronic seeing devices could reach no further than could the bare eye. Don slept through most of it, his head pillowed on a sack of sour-corn seed.

He did not worry about the job ahead—no doubt the officer he was to interpret for, whoever he was, would rendezvous and let him know what he was to do.

Early in the next afternoon they reached the brink of the Great South Sea and Don was transferred to a crazy wagon, a designation which applied to both boat and crew—a flat, jet-propelled saucer fifteen feet across manned by two young extroverts who feared neither man nor mud. The upper works of the boat were covered by a low, polished cone of sheet metal intended to reflect horizontal radar waves upward, or vice versa. It could not protect against that locus in the sky, cone-shaped like the reflector itself, where reflections would bounce straight back to originating stations—but the main dependence was on speed in any case.

Don lay flat on the bottom of the boat, clinging to hand holds and reflecting on the superior advantages of rocket flight, while the crazy wagon skipped and slid over the surface of the sea. He tried not to think about what would happen if the speeding boat struck a floating log or one of the larger denizens of the water. They covered nearly three hundred kilometers in somewhat less than two hours, then the boat skidded and slewed to a stop. "End of the line," called out the downy-cheeked skipper. "Have your baggage checks ready. Women and children use the center escalator." The anti-radar lid lifted.

Don stood up on wobbly legs. "Where are we?"

"Dragonville-by-the-Mud. There's your welcoming committee. Mind your step."

Don peered through the mist. There seemed to be several dragons on the shore. He stepped over the side, went into mud to his boot tops, scrambled up to firmer soil. Behind him, the crazy wagon lowered its cover and gunned away at once, going out of sight while still gathering speed. "They might at least have waved," Don muttered and turned back to the dragons. He was feeling considerably perplexed; there seemed to be no men around and he had been given no instructions. He wondered if the officer he had expected to find—surely by this time! — had failed to run the gauntlet safely.

There were seven of the dragons, now moving toward him. He looked them over and whistled a polite greeting, while thinking how much one dragon looks like another. Then the center one of the seven spoke to him in an accent richly reminiscent of fish-and-chips. "Donald, my dear boy! How very happy I am to see you! Shucks!"

XIV

"LET'S HAVE IT, THEN."

DON gulped and stared and almost lost track of his manners. "Sir Isaac! Sir Isaac!" He stumbled toward him.

It is not practical to shake hands with a dragon, kiss it, nor hug it. Don contented himself with beating Sir Isaac's armored sides with his fists while trying to regain control of himself. Long-suppressed emotions shook him, spoiling voice and vision. Sir Isaac waited patiently, then said, "Now, Donald, if I may present my family.

Don pulled himself together, cleared his throat, and wet his whistle. None of the others had a voder; it was possible that they did not even understand Basic.

"May they all die beautifully!"

"We thank you."

A daughter, a son, a granddaughter, a grandson, a great granddaughter, a great grandson—counting Sir Isaac himself, a four generation welcome, only one short of maximum dragon protocol; Don was overwhelmed. He knew that Sir Isaac was friendly to him, but he decided that this degree of ceremony must be a compliment to his parents.

"My Father and my Mother thank you all for the kindness you do to their egg."

"As the first egg, so the last. We are very happy to have you here, Donald."

A dragon visitor, honored by an escort, would have made a leisurely progress to the family seat flanked by the family members. But a dragon's leisurely progress is about twice as fast as a brisk walk for a man. Sir Isaac settled himself down and said, "Suppose you borrow my legs, dear boy; we have considerable distance to go."

"Oh, I can walk"

"Please — I insist."

"Well. . ."

"'Upsy-daisy'! then — if I recall the idiom correctly."

Don climbed aboard and settled himself just abaft the last pair of eyestalks; they turned around and surveyed him. He found that Sir Isaac had thoughtfully had two rings riveted to his neck plates to let him hold on. "All set?"

"Yes, indeed."

The dragon reared himself up again and they set out, with Don feeling like Toomai-of-the-Elephants.

They went up a crowded dragon path so old that it was impossible to tell whether it was an engineering feat or a natural conformation. The path paralleled the shore for a mile or so; they passed dragons at work in their watery fields, then the path swung inland. Shortly, in the dry uplands, his party turned out of the traffic into a tunnel. This was definitely art not nature; it was one of the sort the floor of which slides quietly and rapidly away in the direction one walks (provided the walker is a dragon or weighs as much as a dragon); their ambling gait was multiplied by a considerable factor. Don could not judge the true speed nor the distance covered.

They came at last out into a great hall, large even for dragons; the flowing floor merged into the floor of the hall imperceptibly and stopped. Here were gathered the rest of the tribe symbolized by the seven who had met him. But Don was not required then to rack his brain for compliments, but was taken, still in accordance with etiquette, at once to his own chambers to rest and refresh himself.

The chambers were merely comfortable by Venerian standards; to Don, of course, they were huge. The wallowing trough in the center of the main room was less than six feet deep only at the ramp and it was long enough for him to take several strokes—which he did very soon with great pleasure. The water was as pure as the Sea he had just crossed was dirty and it was, as nearly as he could tell, heated for him to exactly the 98.6° of a human's blood.

He turned over on his back and floated, staring up into the artificial mist that concealed the remote ceiling. This, he thought, was certainly the life! It was the best bath he had had since—well, since that dilly of a bath in the Caravansary back in New Chicago, how long ago? Don thought with a sudden twinge of nostalgia that his class in school had graduated long since.

Growing tired even of such luxury he climbed out, then took his clothes and scrubbed out ancient dirt as best he could, while wishing for detergent, or even for the grey homemade soap the farmers used. He paddled around in bare feet, looking for somewhere to hang his wash. In the "small" retiring room he stopped suddenly.

Supper was ready. Someone had set a table for him, complete to fine napery—a card table, it was, with "Grand Rapids" spelled out in its lines. The chairs drawn up to it actually did have "Grand Rapids" stamped into its under side; Don turned it over and looked.

The table had been set in accordance with human customs. True, the soup was in the coffee cup' and the soup plate contained coffee, but Don was in no mood to care about such details—they were both hot. So was the sour bread toast and the scrambled eggs—shell eggs, if he was a judge.

He spread his wet clothes on the warm, tiled floor, hastily patted them smooth, drew up the chair and fell to. "As you say, Skipper," he muttered, "we never had it so good."

There was a foam mattress on the floor of another bay of the same room; Don did not need to look to see that it was Greenie general issue (officers). There was no bedframe and no blankets, but neither was necessary. Knowing that he would not be disturbed nor expected to put in an appearance until it suited him, he spread himself out on it after dinner. He was very tired, he now realized, and he certainly had much to think about.

The reappearance of Sir Isaac caused buried memories to lift their heads, fresh and demanding. He thought again of his school, wondered where his roommate was. Had he joined up on the other side? He hoped not . . . yet knew in his heart that Jack had. You did what you had to do, judging it from where you were. Jack wasn't his enemy, couldn't be. Good old Jack! He hoped strongly that the wild chances of war would never bring them face to face.

He wondered if Lazy still remembered him.

He saw again Old Charlie's face, suddenly blasted out of human shape . . . and again his heart raged with the thought. Well, he had paid back for Old Charlie, with interest. He grieved again for Isobel.

Finally he wondered about the orders, all the way from HQ, that had sent him to Sir Isaac. Was there actually a military job here? Or had Sir Isaac simply found out where he was and sent for him? The last seemed more likely; HQ would regard a request from a prince of the Egg as a military "must", dragons being as important as they were to operations.

He scratched the scar on his left arm and fell asleep.

Breakfast was as satisfactory as supper. This time there was no mystery about its appearance; it was wheeled in by a young dragon—Don knew that she was young as her rear pair of eyestalks were still buds; she could not have been more than a Venus century old. Don whistled his thanks; she answered politely and left.

Don wondered if Sir Isaac employed human servants; the cooking puzzled him, dragons simply do not cook. They prefer their fodder fresh, with a little of the bottom mud still clinging to it, for flavor. He could imagine a dragon boiling an egg the proper length of time, the time having been stated, but his imagination boggled at anything more complicated. Human cookery is an esoteric and strictly racial art.

His puzzlement did not keep him from enjoying breakfast.

After breakfast, his self-confidence shored up by clean and reasonably neat clothes, he braced himself for the ordeal of meeting Sir Isaac's numerous family. Used as he was to acting as a "true speech" interpreter, the prospect of so much ceremoniousness in which he himself would be expected to play a central and imaginative part made him nervous. He hoped that he would be able to carry it off in a fashion that would reflect honor on his parents and not embarrass his sponsor.

He had shaved sketchily, having no mirror, and was ready to make his sortie, when he heard his name called. It surprised him, as he knew that he should not have been disturbed—being a guest freshly arrived—even if he chose to stay in his chambers for a week, or a month—or forever.

Sir Isaac lumbered in. "My dear boy, will you forgive an old man in a hurry for treating you with the informality ordinarily used only with one's own children?"

"Why, certainly, Sir Isaac." Don was still puzzled. If Sir Isaac were a dragon in a hurry, he was the first one in history.

"If you are refreshed, then please come with me." Don did so, reflecting that they must have had him under observation; Sir Isaac's entrance was too timely. The old dragon led him out of his chambers, down a passage, and into a room which might have been considered cozy by dragon standards; it was less than a hundred feet across.

Don decided that it must be Sir Isaac's study, as there were roll upon roll of ribbon books racked on the walls and the usual sort of rotating bench set at the height of his handling tentacles. Above the racks on one wall was what Don judged to be a mural, but it looked like meaningless daubs to him; the three colors in the infrared which dragons see and we do not produced the usual confusion. On second thought he decided that it might actually be meaningless; certainly a lot of human art did not seem to mean anything.

But the point which he noticed most and wondered about was that the room contained not one but two chairs meant for humans.

Sir Isaac invited him to sit down. Don did so and found that the chair was of the best powered furniture; it felt out his size and shape and conformed to it. He found out at once for whom the other terrestrial chair was intended; a man strode in—fiftyish, lean and hard in the belly, wiry grey hair around a bald pate. He had an abrupt manner and gave the impression that his orders were always obeyed. "Morning, gentlemen!" He turned to Don. "You're Don Harvey. My name's Phipps—Montgomery Phipps." He spoke as if that were sufficient explanation. "You've grown some. Last time I saw you I walloped your britches for biting my thumb."

Don felt put off by the man's top-sergeant air. He supposed that it was some acquaintance of his parents whom he had met in the dim reaches of his childhood, but he could not place him. "Did I have reason to bite it?" he asked.

"Eh?" The man suddenly gave a barking laugh. "I suppose that is a matter of opinion. But we were even; I spanked you properly." He turned to Sir Isaac. "Is Malath going to be here?"

"He told me that he would make the effort. He should be along shortly."

Phipps threw himself in the other chair and drummed on the arms of it. "Well, I suppose we must wait, though I don't see the need of his attending. There has been much too much delay now—we should have had this meeting last night."

Sir Isaac managed to drag a shocked tone out of his voder. "Last night? With a guest newly arrived?"

Phipps shrugged. "Never mind." He turned back to Don. "How did you like your dinner, son?"

"Very much."

"My wife cooked it. She's busy in the lab now, but you'll meet her later. Top flight chemist—in or out of the kitchen."

"I'd like to thank her," Don said sincerely. "Did you say 'lab'?"

"Eh? Yes, yes—quite a place. You'll see it later. Some of the best talent on Venus here. The Federation's loss is our gain."

The questions that immediately popped into Don's mind were held up; someone, something was coming in. Don's eyes widened when he saw that it was a Martian's "pram"—the self-propelled personal environment without which a Martian cannot live either on Earth or Venus. The little car wheeled in and joined the circle; the figure inside raised itself to a sitting position with the aid of its powered artificial exoskeleton, tried feebly to spread its pseudowings and spoke, its thin, tired voice amplified through a speaking system. "Malath da Thon greets you, my friends."

Phipps stood up. "Malath old boy, you should be back in your tank. You'll kill yourself exerting like this."

"I shall live as long as is necessary."

"Here's the Harvey kid. Looks like his old man, doesn't he?"

Sir Isaac, shocked by such casualness, intervened with a formal introduction. Don tried feverishly to recall more than two words of High Martian, gave up and let it go with, "I'm glad to know you, sir."

"The honor is mine," answered the tired voice. " 'A tall father casts a long shadow.'"

Don wondered what to answer while reflecting that the rowdy lack of manners of the moveovers had its points. Phipps broke in with, "Well, let's get down to business before Malath wears himself out. Sir Isaac?"

"Very well. Donald, you know that you are welcome in my house."

"Uh—why, yes, Sir Isaac, thank you."

"You know that I urged you to visit me before I knew aught of you but your parentage and your own good spirit."

"Yes, sir, you asked me to look you up. And I tried to, I really did—but I didn't know where you had landed. I was just getting organized to do a little detective work on it when the Greenies landed. I'm sorry." Don felt vaguely uncomfortable, knowing that he had put the matter off until he had a favor to ask.

"And I tried to find you, Donald—and was caught by the same mischance. Most recently, by rumors that are carried on the mist, did I discover where you were and what you were doing." Sir Isaac paused as if he found the choice of words difficult. "Knowing that this house is yours, knowing that you were welcome in any case, can you forgive me when you discover you were summoned also for a most practical reason?"

Don decided that this called for "true speech." " 'How can the eyes offend the tail? Or father offend son?' What can I do to help, Sir Isaac? I had already gathered that something was up."

"How shall I begin? Should I speak of your Cyrus Buchanan who died far from his people, yet died happily since he had made us his people, too? Or should I speak of the strange and complicated customs of your own people wherein you sometimes—or so it appears to us—cause the jaw to bite its own leg? Or should I discuss directly the events that have happened here since first you and I shared mud in the sky?"

Phipps stirred uneasily. "Let me handle it, Sir Isaac. Remember that this young man and I are of the same race. We won't have to beat around the bush; I can put it up to him in two words. It isn't complicated."

Sir Isaac lowered his massive head. "As you wish, my friend."

Phipps turned to Don. "Young fellow, you didn't know it, but when your parents called you home to Mars, you were a courier with a message."

Don looked at him sharply. "But I did know it." His mind raced ahead, adjusting himself to this new situation.

"You did? Well, that's fine! Let's have it, then."

"Have what?"

"The ring—the ring, of course. Give it to us."

XV

"JUDGE NOT ACCORDING TO THE APPEARANCE" JOHN VII:24

"WAIT a minute," Don protested. "You're mixed up. I know what ring you mean, all right, but it wasn't the ring; it was the paper that it was wrapped in. And the I.B.I. got that."

Phipps looked perplexed, then laughed. "They did, eh? Then they made the same mistake you did. But it's the ring itself that is important. Let's have it."

"You must be mistaken," Don answered slowly. "Or maybe we aren't talking about the same ring." He thought about it. "It's possible that the I.B.I. swapped rings before the package ever reached me. But it's a dead cinch that the ring that was delivered to me couldn't have contained a message. It was transparent plastic—styrene, probably—and there wasn't even a fly speck in it. No message. No way to hide a message."

Phipps shrugged impatiently. "Don't quibble with me as to whether or not a message could be concealed in the ring—it's the right ring; be sure of that. The I.B.I. didn't switch rings—we know."

"How do you know?"

"Confound it, boyl Your function was to deliver the ring, that's all. You let us worry about the message in it."

Don was beginning to feel sure that when his younger self had bitten Phipps' thumb, he must have been justified. "Wait a minute! I was to deliver the ring, yes—that is what Dr. Jefferson—you know who he is?"

"I knew who he was. I've never met him."

"That's what Dr. Jefferson wanted. He's dead, or so they told me. In any case I can't consult him. But he was ,very specific about to whom I was to deliver it—to my father. Not to you."

Phipps pounded the arm of the chair. "I know it, I know it! If things had gone properly, you would have delivered it to your father and we would have been saved no end of trouble. But those eager lads in New London had to— Never mind. The rebellion occurring when it did caused you to wind up here instead of on Mars. I'm trying to pick up the pieces. You can't deliver it to your father, but you can get the same result by turning it over to me. Your father and I are working toward the same end."

Don hesitated before answering, "I don't wish to be rude —but you ought to give some proof of that."

Sir Isaac produced with his voder a sound exactly like a man clearing his throat. "Ahem!" They both turned their heads toward him. "Perhaps," he went on, "I should enter the discussion. I have known Donald, if I may say so, more recently, my dear Phipps."

"Well—go ahead."

Sir Isaac turned most of his eyes on Don. "My dear Donald, do you trust me?"

"Uh, I think so, Sir Isaac—but it seems to me that I am obligated to insist on proof. It isn't my ring."

"Yes, you have reason. Then let us consider what would be proof. If I say. . .

Don interrupted, feeling that the whole matter was out of hand. "I'm sorry I let this grow into an argument. You see, it does not matter."

"Eh?"

"Well, you see, I don't have the ring any longer. It's gone."

There was a dead silence for a long minute. Then Phipps said, "I think Malath has fainted."

There was scurrying excitement while the Martian's cart was removed to his chambers, tension until it was reported that he was floating in his very special bed and resting comfortably. The conference resumed with three members. Phipps glowered at Don. "It's your fault, you know. What you said took the heart out of him."

"Me? I don't understand."

"He was a courier, too—he was stranded here the same way you were. He has the other half of the message—of the message you lost. And you removed the last possible chance he has of getting home before high gravity kills him. He's a sick man—and you jerked the rug out from under him."

Donald said, "But—"

Sir Isaac interrupted. "Donald is not at fault. The young should be blamed only with just cause and after deliberation, lest the family sorrow."

Phipps glanced at the dragon, then back at Don. "I'm sorry. I'm tired and bad tempered. What's done is done. The important point is: what happened to the ring? Is there any possibility of locating it?"

Don looked unhappy. "I'm afraid not." He explained rapidly about the attempt to get the ring from him and how he had had no proper place to protect it. "I didn't know that it was really important but I was determined to carry out Dr. Jefferson's wishes—maybe I'm sort of stubborn at times. So I did the best I could think of to do; I turned it over to a friend for safekeeping. I figured that was best because no one would think of looking for it in the hands of a person who wouldn't be expected to have it."

"Sound enough," agreed Phipps, "but to whom did you give it?"

"A young lady." Don's features contorted. "I think she was killed when the Greenies attacked."

"You don't know?"

"I'm fairly certain. I've been doing work that gives me opportunities to ask and nobody has laid eyes on her since the attack. I'm sure she's dead."

"You could be wrong. What was her name?"

"Isobel Costello. Her father managed the I. T. & T. branch."

Phipps looked utterly astounded, then lay back in his chair and roared. Presently he wiped his eyes and said, "Did you hear that, Sir Isaac? Did you hear that? Talk about the Blue Bird in your own back yard! Talk about Grandma's spectacles!"

Don looked from one to the other. "What do you mean?" he asked in offended tones.

"What do I mean? Why, son, Jim Costello and his daughter have been right here since two days after the attack." He jumped out of his chair. "Don't move! Stay where you are—I'll be right back."

And he was back quickly. "I always have trouble with those funny house phones of yours, Sir Ike," he complained. "But they're coming." He sat down and heaved a sigh. "Some days I'm tempted to turn myself in as an idiot."

Phipps shut up, save for a suppressed chuckle or two. Sir Isaac seemed to be contemplating his nonexistent navel. Don was preoccupied with turbulent thoughts, relief too great to be pleasure. Isobel alive!

Presently, calm somewhat restored, he spoke up. "Look, isn't it about time somebody told me what this is all about?"

Sir Isaac lifted his head and his tendrils played over the keys. "Your pardon, dear boy. I was thinking of something else. Long, long ago when my race was young and when your race had not yet—"

Phipps cut in. "Excuse me, old boy, but I can brief it and you can fill him in on the details later." He assumed assent and turned to Don. "Harvey, there is an organization—a cabal, a conspiracy, a secret lodge call it what you like—we just call it 'The Organization'. I'm a member, so is Sir Isaac, so is old Malath—and so are both of your parents. And so was Dr. Jefferson. It's made up mostly of scientists but it is not limited to them; the one thing we all have in common is a belief in the dignity and natural worth of free intelligence. In many different ways we have fought—and fought unsuccessfully, I should add—against the historical imperative of the last two centuries—the withering away of individual freedom under larger and even more pervasive organizations, both governmental and quasi-governmental.

"On Earth our group derives from dozens of sources, way back in history —associations of scientists fighting against secrecy and the straitjacketing of thought, artists fighting against censorship, legal aid societies, many other organizations, most of them unsuccessful, and some downright stupid. About a century ago all such things were pushed underground; the weak sisters dropped out, the talkative got themselves arrested and liquidated—and the remnants consolidated.

"Here on Venus our origins go clear back to the rapprochement between Cyrus Buchanan and the dominant natives. On Mars, in addition to many humans—more about them later—the organization is affiliated with what we call the 'priest class'—a bad translation, for they aren't priests; 'judges' would be closer."

Sir Isaac interrupted. "Elder brothers."

"Eh? Well, maybe that is a fair poetical rendering. Never mind. The point is, the whole organization, Martian, Venerian, Terrestrial, has been striving—"

"Just a minute," put in Don. "If you can answer me one question, it would clear up a whole lot. I'm a soldier of the Venus Republic and we've got a war on. Tell me this: is this organization—here on Venus, I mean—helping in our fight to chuck the Greenies out?"

"Well, not precisely. You see—"

Don did not then find out what it was he was supposed to see; another voice cut through Phipps' words: "Don! Donald!"

He found himself swarmed by a somewhat smaller and female member of his own race. Isobel seemed determined to break his neck. Don was embarrassed and upset and most happy. He gently removed her arms from his neck and tried to pretend that it had not happened —when he caught sight of her father looking at him quite oddly. "Uh, hello, Mr. Costello."

Costello advanced and shook hands with him. "How do you do, Mr. Harvey? It's good to see you again."

"It's good to see you. I'm mighty glad to see you folks alive and in one piece. I thought you had had it."

"Not quite. But it was a near thing."

Isobel said, "Don, you look older—much older. And how thin you are!"

He grinned at her. "You look just the same, Grandma."

Phipps interrupted, "Much as I dislike breaking up Old Home Week we have no time to waste. Miss Costello, we want the ring."

"The ring?"

"He means," explained Don, "the ring I left with you."

"Ring?" said Mr. Costello. "Mr. Harvey, did you give my daughter a ring?"

"Well, not exactly. You see. . ."

Phipps interrupted again. "It's the ring, Jim—the message ring. Harvey was the other courier—and it seems he made your daughter sort of a deputy courier."

"Eh? I must say I'm confused." He looked at his daughter.

"You have it?" Don asked her. "You didn't lose it?"

"Lose your ring? Of course not, Don. But I had thought—never mind; you want it back now." She glanced around at the eyes on her—fourteen, counting Sir Isaac's—then moved away and turned her back. She turned around again almost immediately and held out her hand. "Here it is."

Phipps reached for it. Isobel drew her hand away and handed it to Don. Phipps opened his mouth, closed it again, then reopened it. "Very well—now let's have it, Harvey."

Don put it in a pocket. "You never did get around to explaining why I should turn it over to you."

"But—" Phipps turned quite red. "This is preposterous! Had we known it was here, we would never have bothered to send for you—we would have had it without your leave."

"Oh, no!"

Phipps swung his eyes to Isobel. "What's that, young lady? Why not?"

"Because I wouldn't have given it to you—not ever. Don told me that someone was trying to get it away from him. I didn't know that you were the one."

Phipps, already red-faced, got almost apoplectic. "I've had all this childish kidding around with serious matters that I can stand." He took two long strides to Don and grasped him by the arm. "Cut out the nonsense and give us that message!"

Don shook him off and backed away half a step, all in one smooth motion—and Phipps looked down to see the point of a blade almost touching his waistband. Don held the knife with the relaxed thumb-and-two-finger grip of those who understand steel.

Phipps seemed to have trouble believing what he saw. Don said to him softly, "Get away from me."

Phipps backed away. "Sir Isaac!"

"Yes," agreed Don. "Sir Isaac—do I have to put up with this in your house?"

The dragon's tentacles struck the keys, but only confused squawking came out. He stopped and started again and said very slowly, "Donald—this is your house. You are always safe in it. Please—by the service you did me—put away your weapon."

Don glanced at Phipps, straightened up and caused his knife to disappear. Phipps relaxed and turned to the dragon. "Well, Sir Isaac? What are you going to do about it?"

Sir Isaac did not bother with the voder. "Remove thyself!"

"Eh?"

"You have brought dissension into this house. Were you not both in my house and of my family? Yet you menaced him. Please go—before you cause more sorrow."

Phipps started to speak, thought better of it—left. Don said, "Sir Isaac, I am terribly sorry. I—"

"Let the waters close over it. Let the mud bury it. Donald, my dear boy, how can I assure you that what we ask of you is what your honored parents would have you do, were they here to instruct you?"

Don considered this. "I think that's just the trouble, Sir Isaac—I'm not your 'dear boy.' I'm not anybody's 'dear boy.' My parents aren't here and I'm not sure that I would let them instruct me if they were. I'm a grown man now—I'm not as old as you are, not by several centuries. I'm not very old even by human standards—Mr. Phipps still classes me as a boy and that was what was wrong. But I'm not a boy and I've got to know what's going on and make up my own mind. So far, I've heard a lot of sales talk and I've been subjected to a lot of verbal pushing around. That won't do; I've got to know the real facts." Before Sir Isaac could reply they were interrupted by another sound—Isobel was applauding. Don said to her. "How about you, Isobel? What do you know about all this?"

"Me? Nothing. I couldn't be more in the dark if I were stuffed in a sack. I was just cheering your sentiments."

"My daughter," Mr. Costello put in crisply, "knows nothing at all of these things. But I do—and it appears that you are entitled to answers."

"I could certainly use some!"

"By your leave, Sir Isaac?" The dragon ponderously inclined his head; Costello went on, "Fire away. I'll try to give you straight answers."

"Okay—what's the message in the ring?"

"Well, I can't answer that exactly or we wouldn't need the message ourselves. I know that it's a discussion of certain aspects of physics—gravitation and inertia and spin and things like that. Field theory. It's certainly very long and very complicated and I probably wouldn't understand it if I knew exactly what was in it. I'm simply a somewhat rusty communications engineer, not a topflight theoretical physicist."

Don looked puzzled. "I don't get it. Somebody tucks a physics book into a ring—and then we play cops-and-robbers all around the system. It sounds silly. Furthermore, it sounds impossible." He took the ring out and looked at it; the light shone through it clearly. It was just a notions counter trinket—how could a major work on physics be hidden in it?

Sir Isaac said, "Donald, my dear— I beg pardon. Shucks! You mistake simple appearance for simplicity. Be assured; it is in there. It is theoretically possible to have a matrix in which each individual molecule has a meaning—as they do in the memory cells of your brain. If we had such subtlety, we could wrap your Encyclopedia Britannica into the head of a pin—it would be the head of that pin. But this is nothing so difficult."

Don looked again at the ring and put it back in his pocket. "Okay, if you say so. But I still don't see what all the shooting is about."

Mr. Costello answered, "We don't either—not exactly. This message was intended to go to Mars, where they are prepared to make the best use of it. I myself had not even heard about the project except in the most general terms until I was brought here. But the main idea is this: the equations that are included in this message tell how space is put together—and how to manipulate it. I can't even imagine all the implications of that—but we do know a couple of things that we expect from it, first, how to make a force field that will stop anything, even a fusion bomb, and second, how to hook up a space drive that would make rocket travel look like walking. Don't ask me how—I'm out of my depth. Ask Sir Isaac."

"Ask me after I've studied the message," the dragon commented dryly.

Don made no comment. There was silence for some moments which Costello broke by saying, "Well? Do you want to ask anything? I do not know quite what you do know; I hardly know what to volunteer."

"Mr. Costello, when I talked to you in New London, did you know about this message?"

Costello shook his head. "I knew that our organization had great hopes from an investigation going on on Earth. I knew that it was intended to finish on Mars—you see, I was the key man, the 'drop box,' for communication to and from Venus, because I was in a position to handle interplanetary messages. I did not know that you were a courier—and I certainly did not know that you had entrusted an organization message to my only daughter." He smiled wryly. "I might add that I did not even identify you in my mind as the son of two members of our organization, else there would have been no question about handling your traffic whether you could pay for it or not. There were means whereby I could spot organization messages—identifications that your message lacked. And Harvey is a fairly common name."

"You know," Don said slowly, "it seems to me that if Dr. Jefferson had told me what it was I was carrying—and if you had trusted Isobel here with some idea of what was going on, a lot of trouble could have been saved."

"Perhaps. But men have died for knowing too much. Conversely, what they don't know they can't tell."

"Yes, I suppose so. But there ought to be some way of running things so that people don't have to go around loaded with secrets and afraid to speak!"

Both the dragon and the man inclined their heads. Mr. Costello added, "That's exactly what we're after—in the long run. That sort of a world."

Don turned to his host. "Sir Isaac, when we met in the E Glory Road, did you know that Dr. Jefferson was using me as a messenger?"

"No, Donald—though I should have suspected it when I learned who you were." He paused, then added, "Is there anything more you wish to know?"

"No, I just want to think." Too many things had happened too fast, too many new ideas— Take what Mr. Costello had said about what was in the ring, now—he could see what that would mean—if Costello knew what he was talking about. A fast space drive, one that would run rings around the Federation ships . . . a way to guard against atom bombs, even fusion bombs—Why, if the Republic had such things they could tell the Federation to go fly a kite!

But that so-and-so Phipps had admitted that all this hankypanky was not for the purpose of fighting the Greenies. They wanted to send the stuff to Mars, whatever it was. Why Mars? Mars didn't even have a permanent human settlement—just scientific commissions and expeditions, like the work his parents did. The place wasn't fit for humans, not really. So why Mars?

Whom could he trust? Isobel, of course—he had trusted her and it had paid off. Her father? Isobel and her father were two different people and Isobel didn't know anything about what her father was doing. He looked at her; she stared back with big, serious eyes. He looked at her father. He didn't know, he just didn't know.

Malath? A voice out of a tank! Phipps? Phipps might be kind to children and have a heart of gold, but Don had no reason to trust him.

To be sure, all these people knew about Dr. Jefferson, knew about the ring, seemed to know about his parents—but so had Bankfield. He needed proof, not words. He knew enough now, enough had happened now, to prove to him that what he carried was of utmost importance. He must not make a mistake.

It occurred to him that there was one possible way of checking: Phipps had told him that Malath carried the other half of the same message—that the ring carried only one half. If it turned out that his half fitted the part that Malath carried, it would pretty well prove that these people had a right to the message.

But, confound it all!—that test required him to break the egg to discover that it was bad. He had to know before he turned it over to them. He had met the two-piece message system before; it was a standard military dodge—but used and used only when it was so terribly, terribly important not to let a message be compromised that you would rather not have it delivered than take any risk at all of having it fall into the wrong hands.

He looked up at the dragon. "Sir Isaac?"

"Yes, Donald?"

"What would happen if I refused to give up the ring?"

Sir Isaac answered at once but with grave deliberation. "You are my own egg, no matter what. This is your house—where you may dwell in peace—or leave in peace—as is your will."

"Thank you, Sir Isaac." Don trilled it in dragon symbols—and used "Sir Isaac's" true name.

Costello said urgently, "Mr. Harvey—"

"Yes?"

"Do you know why the speech of the dragon people is called 'true speech'?"

"Uh, why, no, not exactly."

"Because it is true speech. See here—I've studied comparative semantics—the whistling talk does not even contain a symbol for the concept of falsehood. And what a person does not have symbols for he can't think about! Ask him, Mr. Harveyl Ask him in his own speech. If he answers at all, you can believe him."

Donald looked at the old dragon. The thought went racing through his mind that Costello was right—there was no symbol in dragon speech for "lie," the dragons apparently never had arrived at the idea —or the need. Could Sir Isaac tell a lie? Or was he so far humanized that he could behave and think like a man? He stared at Sir Isaac and eight blank, oscillating eyes looked back at him. How could a man know what a dragon was thinking?

"Ask him!" insisted Costello.

He didn't trust Phipps; he couldn't logically trust Costello—he had no reason to. And Isobel didn't figure into it. But a man had to trust somebody, some time! A man couldn't go it alone—all right, let it be this dragon who had "shared mud" with him. "It isn't necessary," Don said suddenly. "Here." He reached into his pocket, took out the ring and slipped it over one of Sir Isaac's tentacles.

The tentacle curled through it and withdrew it into the slowly writhing mass. "I thank you, Mist-on-the-Waters."

XVI

MULTUM IN PARVO

DONALD looked at Isobel and found her still solemn, unsmiling, but she seemed to show approval. Her father sat down heavily in the other chair. "Phew!" he sighed "Mr. Harvey, you are a hard nut. You had me worried."

"I'm sorry. I had to think."

"No matter now." He turned to Sir Isaac. "I guess I had better dig up Phipps. Yes?"

"It won't be necessary." The voice came from behind them; they all turned—all but Sir Isaac who did not need to turn his body. Phipps stood just inside the door. "I came in on the tail end of your remark, Jim. If you want me, I'm here."

"Well, yes."

"Just a moment, then. I came for another reason." He faced Don. "Mr. Harvey, I owe you an apology."

"Oh, that's all right."

"No, let me say my say. I had no business trying to bullyrag you into cooperating. Don't mistake me; we want that ring—we must have it. And I mean to argue until we get it. But I've been under great strain and I went about it the wrong way. Very great strain—that's my only excuse."

"Well," said Don, "come to think about it, so have I. So let's forget it." He turned to his host. "Sir Isaac, may I?" He reached toward Sir Isaac's handling tentacles, putting out his palm. The ring dropped into it; he turned and handed it to Phipps.

Phipps stared at it stupidly for a moment. When he looked up Don was surprised to see that the man's eyes were filled with tears. "I won't thank you," he said, "because when you see what will come of this it will mean more to you than any person's thanks. What is in this ring is of life and death importance to many, many people. You'll see."

Don was embarrassed by the man's naked emotion. "I can guess," he said gruffly. "Mr. Costello told me that it meant bomb protection and faster ships—and I bet on my hunch that you people and I are on the same side in the long run. I just hope I didn't guess wrong."

"Guess wrong? No, you haven't guessed wrong—and not just in the long run, as you put it, but right now! Now that we have this—" he held up the ring, "we stand a fighting chance to save our people on Mars."

"Mars?" repeated Don. "Hey, wait a minute—what's this about

Mars? Who's going to be saved? And from what?"

Phipps looked just as puzzled. "Eh? But wasn't that what persuaded you to turn over the ring?"

"Wasn't what persuaded me?"

"Didn't Jim Costello—" "Why, I thought of course you had—" and Sir Isaac's voder interrupted with, "Gentlemen, apparently it was assumed that. . ."

"Quiet!" Don shouted as Phipps opened his mouth again ; Don hurriedly added, "Things seem to have gotten mixed up again. Can somebody—just one of you—tell me what goes on?"

Costello could and did. The Organization had for many years been quietly building a research center on Mars. It was the one place in the system where the majority of humans were scientists. The Federation maintained merely an outpost there, with a skeleton garrison. Mars was not regarded as being of any real importance—just a place where harmless longhairs could dig among the ruins and study the customs of the ancient and dying race.

The security officers of the I.B.I. gave Mars little attention; there seemed no need. The occasional agent who did show up could be led around and allowed to see research of no military importance.

The group on Mars did not have the giant facilities available on Earth—the mastodonic cybernetic machines, the unlimited sources of atomic power, the superpowerful particle accelerators, the enormous laboratories—but they did have freedom. The theoretical groundwork for new advances in physics had been worked out on Mars, spurred on by certain mystifying records of the First Empire—that almost mythical earlier epoch when the solar system had been one political unit. Don was warmly pleased to hear that his parents' researches had contributed largely at this point in the problem. It was known—or so the ancient Martian records seemed to state—that the ships of the First Empire had traveled between the planets, not in journeys of weary months, or even weeks, but of days.

The descriptions of these ships and of their motive power were extensive, but differences in language, in concept, and in technology created obstacles enough to give comparative semanticists nervous breakdowns—had done so, in fact. A treatise on modern electronics written in Sanskrit poetry with half the thoughts taken for granted would have been lucid in comparison.

It had simply been impossible to make fully intelligible translation of the ancient records. What was missing had to be worked out by genius and sweat.

When the theoretical work had been carried as far as it could be the problem was sent to Earth via members of the Organization for sub rosa testing and for conversion of theory into present-day engineering. At first there was a steady traffic of information back and forth between planets, but, as the secret grew, the members of the Organization were less and less inclined to travel for fear of compromising what they knew. By the time of the Venus crisis it had been standard practice for some years to send critical information by couriers who knew nothing and therefore could not talk—such as Don—or by nonterrestrials who were physically immune to the interrogation methods of the security police—giving a Venerian dragon the "third degree" was not only impractical, but ridiculous. For different but equally obvious reasons Martians too were safe from the thought police.

Don himself was a last-minute choice, a "channel of opportunity"—the Venus crisis had rushed things. How badly it had rushed things no one knew until after Commodore Higgins' spectacular raid on Circum-Terra. The engineering data so urgently needed on Mars had gone to Venus instead, there to be lost (Don's half of it) in the confusion of rebellion and counterblow. The rebelling colonists, driving toward the same goal as the Organization, had unknowingly thwarted their best chance for overthrowing the Federation.

Communication between the Organization members on Venus, on Earth, and on Mars had been precariously and imperfectly reestablished right under the noses of the Federation police. The Organization had members working for I. T. & T. on all three planets—members such as Costello. Costello himself had been helped to make his escape, with Isobel, because he knew too much; they could not afford to have him questioned—but a new "drop box" had been set up at Governor's Island in the person of a Federation communications technical sergeant. The channel to the sergeant was a dragon who had the garbage disposal contract for the "Greenie" base. The dragon had no voder; the sergeant knew no whistle talk—but a tentacle can pass a note to a human hand.

Communication, though difficult and dangerous, was possible; travel between planets for members of the Organization was now utterly impossible. The only commercial line as yet reestablished was the EarthMoon run. The group on Venus was attempting the almost impossible task of completing a project all preliminary preparations for which had been made for Mars. The task was not quite impossible—provided they could find the missing half of the message, they might yet outfit a ship, send it to Mars, and finish the job.

So they hoped . . . and continued to hope until recently, when disastrous news had gotten through to them from Earth—the Organization had been penetrated on Earth; a very senior member, one who knew much too much, had been arrested and had not been able to suicide in time.

And a task force of Federation ships was already on its way to attack the group on Mars.

"Wait a minute!" Don interrupted. "I thought—Mr. Costello, didn't you tell me, back in New London, that the Federation had already moved in on Mars?"

"Not exactly. I told you that I had inferred. . . that the Federation had taken over Schiaparelli Station, the I. T. & T. branch there. And so they had—to the extent of censoring all traffic and putting a stop to all traffic with Venus. They could do that with a squad of soldiers from the pint-sized garrison they've always had there. But this is an attack in force. They mean to liquidate the Organization."

Liquidate the Organization—Don translated the jawbreakers into real words: kill all the people who were against them. That meant his parents

He shook his head to clear it. The thought did not mean anything to him inside. It had been too many years; he could not see their faces—and he could not imagine them dead. He wondered if he himself had become dead inside, unable to feel things. No matter—something had to be done. "What do we do? How can we stop it?"

"We quit wasting time!" answered Phipps. "We've lost half a day already. Sir Isaac?"

"Yes, my friend. Let us hurry."

The room was a laboratory shop, but of dragon proportions. It needed to be, for it held a round dozen of dragons as well as fifty-odd men and a sprinkling of women. Everyone who could manage it wanted to see the opening of the ring. Even Malath da Thon was there, sitting up in his cell with the aid of his powerdriven corset and with the colors of emotion rippling gently across his frail body.

Don and Isobel had climbed to the top of the entrance ramp, where they could see without being in the way. Opposite them was a large stereo tank, lighted but with no picture growing in it. Below them was a micromanipulator, dragon style; other pieces of apparatus and power tools filled the rest of the room. They were strange to Don, not because they were of dragon construction and for dragon use, for many of them were not—they were strange in the way in which laboratory equipment is always exotic to the layman. He was used to dragon artifacts; the two technologies, human and dragon, had interpenetrated sufficiently that a human, especially one living on Venus, found nothing odd in joints that were wrung instead of welded or bolted, nothing unusual in interlocking ovoids where a man would use screws.

Sir Isaac was at the micromanipulator, his tendrils at the controls; down over his head fitted a frame with eight eyepieces. He touched the control rack; the tank rippled and a picture built in it—the ring, in full color and three dimensions. It seemed to be about eight feet across. The boss of the ring faced out, displaying the enamel-filled initial cut into it—a capital "H" framed with a simple circle of white enamel.

The picture flickered and changed. Only a portion of the initial was now visible, but so greatly magnified that the enamel rubbed into the shallow grooves of the letter looked like broken paving blocks. A shadowy pointed cylinder, out of focus save at its very end, moved across the picture; a great oily globe formed on the end of it, detached itself and settled on the enamel. The "paving blocks" started to break up.

Montgomery Phipps climbed the ramp, saw Don and Isobel, and sat down on the edge beside them. He seemed to want to be friendly. "This will be something to tell your grandchildren about," he remarked. "Old Sir Ike at work. The best microtechnician in the system—can darn near pick out a single molecule, make it sit up and beg."

"It rather surprises me," Don admitted. "I hadn't known that Sir Isaac was a laboratory technician."

"He's more than that; he's a great physicist; hadn't the significance of his chosen name struck you?"

Don felt foolish. He knew how dragons went about picking vocalized names, but he took such names for granted, just as he took his own Venerian name for granted. "His whole tribe tends to be scientific," Phipps went on. "There's a grandson who calls himself 'Galileo Galilei'; have you met him? And there's a 'Doctor Einstein' and a 'Madame Curie' and there's an integrating chemist who calls herself—Egg alone knows why!—'Little Buttercup.' But old Sir Ike is the boss man, the top brain—he made a trip to Earth to help with some of the work on this project. But you knew that, didn't you?"

Donald admitted that he had not known why Sir Isaac was on Earth. Isobel put in, "Mr. Phipps, if Sir Isaac was working on this on Earth, why doesn't he know what is in the ring before he opens it?"

"Well, he does and he doesn't. He worked on the theoretical end. But what we will find—unless we get a terrific disappointment—will be detailed engineering instructions worked out for man-type tools and techniques. Very different."

Don thought about it. "Engineering" and "science" were more or less lumped together in his mind; he lacked the training to appreciate the enormous difference. He changed the subject. "You are a laboratory man yourself, Mr. Phipps?"

"Me? Heavens, no! My fingers are all thumbs. The dynamics of history is my game. Theoretical once—applied now. Well, that's a dry hole." His eyes were on the tank; the solvent, sluiced in by what seemed to be hogshead amounts, had washed the enamel out of the groove that defined that part of the initial "H"; the floor of the groove could be seen, bare, amber, and transparent.

Phipps stood up. "I can't sit still—I get nervous. Excuse me, please."
.

"Surely."

A dragon was lumbering up the ramp. He stopped by them just as Phipps was turning away. "Howdy, Mr. Phipps. Mind if I park here?"

"Not at all. Know these people?"

"I've met the lady."

Don acknowledged the introduction, giving both his names and receiving those of the dragon in turn—Refreshing Rain and Josephus ("Just call me 'Joe'"). Joe was the first dragon, other than Sir Isaac, whom Don had met there who was voder trained and equipped; Don looked at him with interest. One thing was certain: Joe had learned English from some master other than the nameless Cockney who had taught Sir Isaac . . . a Texan, Don felt quite sure.

"I am honored to be in your house," Don said to him.

The dragon settled himself comfortably, letting his chin come about to their shoulders. "Not my house. These snobs wouldn't have me around if there wasn't a job I can do a little better than the next hombre. I just work here."

"Oh." Don wanted to defend Sir Isaac against the charge of snobbery but taking sides between dragons seemed unwise. He looked back at the tank. The scan had shifted to the circle of enamel which framed the "H"; fifteen or twenty degrees of it appeared in the tank. The magnification started to swell enormously until one tiny sector filled the huge picture. Again the solvent floated into the enamel; again it washed away.

"Now we are getting someplace, maybe," commented Joe.

The enamel was dissolving like snow in spring rain, but, instead of washing down to a bare floor, something dark was revealed under the paint—a bundle of steel pipes, it seemed to be, nested in the shallow groove.

There was dead silence—then somebody cheered. Don found that he had been holding his breath. "What is it?" he asked Joe.

"Wire. What would you expect?"

Sir Isaac stepped up the magnification and shifted to another sector. Slowly, as carefully as a mother bathing her first born, he washed the covering off the upper layer of the coiled wire. Presently a microscopic claw reached in, felt around most delicately, and extracted one end.

Joe got to his feet. "Got to get to work," he keyed. "That's my cue." He ambled down the ramp. Don noticed that he was growing a new starboardmidships leg and the process was not quite complete; it gave him a lopsided, one-flatwheel gait.

Slowly, tenderly, the wire was cleaned and uncoiled. More than an hour later the tiny hands of the micromanipulator stretched out their prize—four feet of steel wire so gossamer fine that it could not be seen at all by naked eye, even by a dragon.

Sir Isaac backed his head out of the eyepiece rack. "Is Malath's wire ready?" he inquired.

"All set."

"Very well, my friends. Let us commence."

They were fed into two ordinary microwire speakers, rigged in parallel. Seated at a control panel for synchronizing the fragmented message latent in the two wires was a worried-looking man wearing earphones—Mr. Costello. The steel spider threads started very slowly through and a highpitched gabbling came out of the horn. There were very rapid momentary interruptions, like high frequency code.

"Not in synch," announced Mr. Costello. "Rewind."

An operator sitting in front of him said, "I hate to rewind, Jim. These wires would snap if you breathed on them."

"So you break a wire—Sir Isaac will splice it. Rewind!"

"Maybe you've got one in backwards."

"Shut up and rewind."

Presently the gabbling resumed. To Don it sounded the same as before and utterly meaningless, but Mr. Costello nodded. "That's got it. Was it recorded from the beginning?"

Don heard Joe's Texas accents answering, "In the can!"

"Okay, keep it rolling and start playing back the recording. Try slowing the composite twenty to one." Costello threw a switch; the gabbling stopped completely although the machines continued to unreel the invisible threads. Shortly a human voice came out of the loudspeaker horn; it was deep, muffled, dragging, and almost unintelligible. Joe stopped it and made an adjustment, started over. When the voice resumed it was a clear, pleasant, most careful enunciated contralto.

"Title," the voice said, " 'Some Notes on the Practical Applications of the Horst-Milne Equations. Table of Contents: Part One—On the Design of Generators to Accomplish Strain-Free Molar Translation. Part Two—The Generation of SpaceTime Discontinuities, Closed, Open, and Folded. Part Three —On the Generation of Temporary Pseudo-Acceleration Loci. Part One, Chapter One—Design Criteria for a Simple Generator and Control System. Referring to equation seventeen in Appendix A, it will be seen that—' "

The voice flowed on and on, apparently tireless. Don was interested, intensely so, but he did not understand it. He found himself growing sleepy when the voice suddenly rapped out: "Facsimile! Facsimile! Facsimile!"

Costello touched a switch, stopping the voice, and demanded, "Cameras ready?"

"Hot and rolling!"

"Shift!"

They watched the picture build up—a wiring diagram, Don decided it must be—or else a plate of spaghetti. When the picture was complete the voice resumed.

After more than two hours of this, broken only by desultory conversation, Don turned to Isobel. "I'm not doing any good here and I'm certainly not learning anything. What do you say we leave?"

"Suits."

They went down the ramp and headed for a tunnel that led toward living quarters. On the way they ran into Phipps, his face glowing with happiness. Don nodded and started to push on past; Phipps stopped him. "I was just going to hunt you up."

"Me?"

"Yes. I thought you might want this for a souvenir." He held out the ring.

Don took it and examined it curiously. There was a very tiny break in one branch of the "H" where the enamel had been eaten away. The framing circle was an empty, slightly shadowed groove, a groove so narrow and shallow that Don could hardly catch his fingernail in it.

"You've no more use for it?"

"It's squeezed dry. Keep it. You'll be able to sell it to a museum some day, for a high price."

"No," said Don. "I reckon I'll deliver it to my father—eventually."

XVII

TO RESET THE CLOCK

DON moved out of the Gargantuan chambers he had been given and in with the other humans. Sir Isaac would have let him stay until the Sun grew cold, monopolizing an acre or so of living space, but to Don it seemed not only silly for one person to clutter up chambers built big enough for dragons but not entirely comfortable—so much open space made a man tuned to bush fighting uneasy.

The human guests occupied one dragon apartment with the great rooms partitioned off into cubicles. They shared its wallowing trough as a plunge bath and had a communal mess. Don roomed with Dr. Roger Conrad, a tall and shaggy young man with a perpetual grin.

Don was a bit surprised to find that Conrad was held in high esteem by the other scientists.

He saw very little of his roommate, nor of any of the others—even Isobel was busy with clerical work. The team worked night and day with driving intensity. The ring had been opened and they had engineering data to work from, true—but that task force was already swinging toward Mars. Nobody knew—nobody could know—whether or not they could finish in time to save their colleagues.

Conrad had tried to explain it to Don one night late as he was turning in. "We don't have adequate facilities here. The instructions were conceived in terms of Earth-and Mars-type techniques. The dragons do things differently. We've got mighty little of our own stuff and it's hard to jury-rig what we need from their stuff. The original notion was to install the gear in—you know those little jumpbug ships that people use to get around in on Mars?"

"Seen pictures of them."

"Never actually seen 'em myself. Useless as rocketships, of course, but they are pressurized and big enough. Now we've got to adapt for a shuttle." A superstratospheric shuttle "with its ears trimmed"—the spreading glider wings unshipped and carried away—waited in a covered bayou outside Sir Isaac's family seat. It would make the trip to Mars if it could be prepared. "It's a headache," he added.

"Well, can we do it?"

"We'll have to do it. We can't possibly do the design calculations over again; we don't have the machines, even if we had time to reengineer the job—which we haven't."

"That's what I meant. Will you finish in time?"

Conrad sighed. "I wish I knew."

The pressure of time sat heavily on all of them. In their mess hall they had set up a large chart showing Earth, Sun, Venus, and Mars, each in its proper position. At lunch each day the markers were moved along the scribed orbits, the Earth by one degree, Venus a bit more, Mars by only half a degree and a trifle.

A long dotted line curved from a point on Earth's orbit to a rendezvous with Mars—their best estimate of the path and arrival date of the Federation task force. The departure date was all they knew with certainty; the trajectory itself and the arrival date were based on the relative positions of the two planets and what was believed to be the maximum performance of any Federation ship, assuming refueling in parking orbit around Earth.

For a rocket ship some orbits are possible, some are impossible. A military ship in a hurry would not, of course, use the economical doubly-tangent ellipse; such a trip from Earth to Mars would require 258 Earth days. But, even using hyperboloids and wasting fuel, there are severe limits to how quickly a reaction-driven ship can make an interplanetary voyage.

An Earth calendar hung beside the chart; near it was a clock showing Earth Greenwich time. Posted near these was a figure, changed each time the clock read twenty-four hundred, the number of days till M-day—by their best estimate, now only thirty-nine.

Don was enjoying a combat soldier's paradise—hot food sharp on the hour, well cooked and plenty of it, all the sack time he cared to soak up, clean clothes, clean skin, no duties and no hazards. The only trouble was that he soon grew to hate it.

The intense activity around him shamed him into wanting to help—and try to help he did—until he found out that he was being given makework to shut him up. Actually there was nothing he could do to help; the sweating specialists, trying their level best to haywire improbable circuits into working, had no time to waste on an untrained assistant. He gave up and went back to loafing, found that he could sleep all right in the afternoons but that the practice kept him awake at night.

He wondered why he could not enjoy so pleasant a leave. It was not that—he was worried about his parents.

Yes, he was! Though they had grown dim in his memory his conscience was biting him that he was doing nothing helpful for them. That was why he wanted to get out, away from here where he could do no good, back to his outfit, back to his trade—back to where there was nothing to worry about between scrambles—and plenty to worry about then. With the blackness around you and the sound of your mate's breathing on your right and the same for the man on your left—the slow move forward, trying to feel out what dirty tricks the Greenie techs had thought of this time to guard their sleep . . . the quick strike—and the pounding drive back to the boat with nothing to guide you through the dark but the supersonics in your head bones

He wanted to go back.

He went to see Phipps about it, sought him out in his office. "You, eh? Have a cigarette."

"No, thanks."

"Real tobacco—none of your 'crazy weed.'"

"No, thanks, I don't use 'em."

"Well, maybe you've got something. The way my mouth tastes these mornings—" Phipps lit up himself, sat back and waited.

Don said, "Look—you're the boss around here."

Phipps exhaled, then said carefully, "Let's say I'm the coordinator. I certainly don't try to boss the technical work."

Don brushed it aside. "You're the boss for my purposes. See here, Mr. Phipps, I feel useless around here. Can you arrange to get me back to my outfit?"

Phipps carefully made a smoke ring. "I'm sorry you feel that way. I could give you work to do. You could be an executive assistant to me."

Don shook his head. "I've had enough of 'pick up sticks and lay them straight. I want real work—my own work. I'm a soldier and there's a war going on—that's where I belong. Now when can I get transportation?"

"You can't."

"Huh?"

"Mr. Harvey, I can't let you go; you know too much. If you had turned over the ring without asking questions, you could have gone back to your outfit the next hour—but you had to know, you had to know everything. Now we don't dare risk your capture. You know the Greenies put every prisoner through full interrogation; we can't dare risk that—not yet."

"But—Dog take it, sir, I'll never be captured! I made up my mind about that a long time ago."

Phipps shrugged. "If you get yourself killed, that's all right. But we can't be sure of that, no matter how resolute you are. We can't risk it; there's too much at stake."

"You can't hold me here! You have no authority over me!"

"No. But you can't leave."

Don opened his mouth, closed it, and walked out.

He woke up the next morning determined to do something about it. But Dr. Conrad was up before he was and stopped to make a suggestion before he left. "Don?"

"Yeah, Rog?"

"If you can tear yourself out of that sack, you might come around to the power lab this morning. There will be something worth looking at—I think."

"Huh? What? What time?"

"Oh, say about nine o'clock."

Don showed up, along with apparently every human in the place and about half of Sir Isaac's numerous family. Roger Conrad was in charge of the demonstration. He was busy at a control console which told the uninstructed observer nothing. He busied himself with adjustments, looked up and said, "Just keep your eyes on the birdie, folks—right over that bench." He pressed a key.

There flicked into being over the bench, hanging in the air unsupported, a silvery ball some two feet across. It seemed to be a perfect sphere and a perfect reflector and, more than anything else in the world, it made Don think of a Christmas tree ornament. Conrad grinned triumphantly. "Okay, Tony—give it the ax!"

Tony Vincente, the most muscular of the laboratory crew, picked up a broadbladed ax he had ready. "How would you like it split—up and down, or sideways?"

"Suit yourself."

Vincente swung the ax over his head and brought it down hard.

It bounced off.

The sphere did not quiver, nor was there any mar on its perfect mirror surface. Conrad's boyish grin got even wider. "End of act one," he announced and pressed another button. The sphere disappeared, left nothing to show where it had been.

Conrad bent over his controls. "Act two," he announced. "We now cancel out half the locus. Stand clear of the bench." Shortly he looked up. "Ready! Aim! Fire!" Another shape took being, a perfect sphere otherwise like the last. Its curved outer surface was faced up. "Stick the props in, Tony."

"Just a sec, while I light up." Vincente lit a cigarette, puffed it vigorously, then propped it in an ash tray and slid it under the half globe. Conrad again manipulated his controls; the shape descended, rested on the bench, covering the burning cigarette on its tray. "Anybody want to try the ax on it, or anything else?" asked Conrad.

Nobody seemed anxious to tamper with the unknown. Conrad again operated his board and the silver bowl lifted. The cigarette still smoldered in the tray, unaffected. "How," he asked, "would you like to put a lid like that over the Federation's capital at Bermuda—and leave it in place until they decided to come to terms?"

The idea quite evidently met with unanimous approval. The members of the Organization present were all, or almost all, citizens of Venus, emotionally involved in the rebellion no matter what else they were doing. Phipps cut through the excited comment with a question. "Dr. Conrad—would you give us a popular explanation of what we have seen? Why it works, I mean; we can guess at its enormous potentials."

Conrad's face got very serious. "Mmm . . . Chief, perhaps it would be clearest to say that the fasarta modulates the garbab in such a phase relationship that the thrimaleen is forced to bast—or, to put it another way, somebody loosed mice in the washroom. Seriously, there is no popular way to explain it. If you were willing to spend five hard years with me, working up through the math, I could probably bring you to the same level of ignorance and confusion that I enjoy. Some of the tensor equations involved are, to put it mildly, unique. But the instructions were clear enough and we did it."

Phipps nodded. "Thanks—if that is the word I want. I'll ask Sir Isaac."

"Do, please. I'd like to listen."

Despite the proof that the lab crew had been able to jury-rig at least part of the equipment described by the message in the two wires, Don's jitters got no better. Each day the sign in the mess hall reminded him that time was running out—and that he was sucking his thumb while it did so. He thought no more about trying to get them to send him back to the war zone; instead he began to make plans to get there on his own.

He had seen maps of the Great South Sea and knew roughly where he was. To the north there was territory uninhabited even by dragons—but not uninhabited by their carnivorous cousins. It was considered impassable. The way to the south around the lower end of the sea was much farther, but it was dragon country all the way right up to outlying human farms. With whistle speech and food enough to last at least a week he might get through to some settler who could pass him along to the next. As for the rest he had his knife and he had his wits and he was much more swampwise than he had been when he had made his escape from Bankfield's men.

He began to sneak food out of the mess hall and cache it in his room.

He was within a day and a night of attempting his break when Phipps sent for him. He considered not showing up but decided that it would be less suspicion-arousing to comply.

"Sit down," Phipps began. "Cigarette? No—I forgot. What have you been doing with yourself lately? Keeping busy?"

"Not a darn thing to do!"

"Sorry. Mr. Harvey, have you given any thought to what sort of a world we will have when this is over?"

"Well, no, not exactly." He had thought about it, but his own imaginings were too poorly worked out for him to care to express them. As for himself, someday the war would be over—he supposed—and then he would carry out his long-postponed intention of seeking out his parents. After that, well ..."

"What sort of world would you like it to be?"

"Uh? Well, I don't know." Don pondered. "I guess I'm not what you call 'politically minded.' I don't much care how they run it—except, well, there ought to be a sort of looseness about it. You know—a man ought to be able to do what he wants to, if he can, and not be pushed around."

Phipps nodded. "You and I have more in common than you may have thought. I'm not a purist in political theory myself. Any government that gets to be too big and too successful gets to be a nuisance. The Federation got that way—it started out decently enough—and now it has to be trimmed down to size. So that the citizens can enjoy some looseness. "

Don said, "Maybe the dragons have the right idea—no organization bigger than a family."

Phipps shook his head. "What's right for dragons is not right for us. Anyhow, families can be just as oppressive as government—take a look at the youngsters around here; five hundred years or so to look forward to before they can sneeze without permission. I asked your opinion because I don't know the answer myself—and I've studied the dynamics of history longer than you've been alive. All I know is that we are about to turn loose into the world forces the outcome of which I cannot guess."

Don looked startled. "We've got space travel now; I don't see what important difference it will make to make it faster. As for the other gimmick, it seems to me a swell idea to be able to put a lid on a city so that it can't be atom-bombed."

"Granted. But that is just the beginning. I've been making a list of some of the things that will come about—I think. In the first place you vastly underestimate the importance of speeding up transportation. As for the other possibilities, I'm stumped. I'm too old and my imagination needs greasing. But here's one for a starter: we might be able to move water, lots of water, significant amounts, from here to Mars." His brow wrinkled. "We might even be able to move planets themselves."

Don looked up suddenly. Somewhere he had heard almost those same words . . . the memory evaded him.

"But never mind," Phipps went on. "I was just trying to get a younger, fresher viewpoint. You might think about it. Those laboratory laddies won't, that's sure. These physicists—they produce wonders but they never know what other wonders their wonders will beget." He paused and added, "We are resetting the clock, but we don't know what time it will be."

When he added nothing more Don decided with relief that the interview was over and started to get up. "No, no, don't go," Phipps put in. "I had another matter on my mind. You've been getting ready to leave, haven't you?"

Don stuttered and stammered. "What gave you that idea?"

"I'm right. Some morning we would wake up and find your bed empty. Then I'd be put to a lot of trouble when effort can't be spared to try to find you and bring you back."

Don relaxed. "Conrad snitched to you," he said bitterly.

"Conrad? No. I doubt if the good doctor ever notices anything larger than an electron. No, credit me with some sense. My business is people. True, I did badly with you when you first arrived—but I still plead that I was bone weary. Tiredness is a mild insanity. The point is: you're leaving and I can't stop you. I know dragons well enough to know that Sir Isaac wouldn't let me if you wanted to go. You're 'his' confounded 'egg'! But I can't let you go; the reasons are just as compelling as before. So—rather than let you go, I'd have to try to kill you."

Don leaned forward, shifting his weight onto his feet. "Do you think you could?" he said very softly.

Phipps grinned. "No, I don't. That's why I've had to think up another scheme. You know that we are making up the ship's crew. How would you like to go along?"

XVIII

LITTLE DAVID

Don let his mouth drop open and left it that way. To his credit, while he had thought about it, he had never given it the slightest serious consideration; he was not conceited enough to think that he would be allowed to hitch a ride, just to suit his personal wishes, on this trip.

Phipps went on, "Frankly, I'm doing it to get rid of you, to put you on ice, safe from the Federation's inquisitors, until it no longer matters. But I think I can justify it. We want to train as many as the Little David can carry on this trip as cadres for more ships. But my choice is limited—most of our group here are too old, or they are nearsighted, narrow-chested young geniuses suitable only for laboratories. You are young, you are healthy, your reflexes are fast—I know! —and you are spacewise from babyhood. True, you are not a qualified shiphandler, but that won't matter too much; these ships will be new to everyone. Mr. Harvey, how would you like to go to Mars and return as 'Captain Harvey,' master of your own ship—a ship strong enough to strike at these Federation vermin orbiting around Venus?

"Or executive officer, at least," Phipps qualified, reflecting that in a two-man ship Don could hardly be less.

Like it? He'd love it! Don's tongue got twisted trying to accept too quickly. Then almost at once he was struck by a cold thought; Phipps saw from his expression that something was wrong. "What's the matter?" Phipps said sharply. "Are you afraid?"

"Afraid?" Don looked annoyed. "Of course I'll be afraid! I've been afraid so many times that I am no longer scared to be afraid again. That's not the trouble."

"What is it, then? Speak up!"

"It's just this—I'm still on active duty. I can't go gallivanting off a hundred million miles or so. Properly speaking, it would be desertion.

Why, when they laid hands on me, they'd probably hang me first and ask questions afterwards."

Phipps relaxed. "Oh. Perhaps that can be managed. You let me worry about it."

It could be managed. It was only three days later that Don received new orders, written this time, and delivered by devious means that he could only guess at. They read:

To: Harvey, Donald J., Sergeant—Specialist 1/c Via: Channels

1. You are assigned to special temporary duty of indefinite duration.

2. You will travel as necessary to carry out this duty.

3. This assignment is deemed in the best interests of the Republic. When, in your opinion, your duties are completed, you will report to the nearest competent authority and request transportation to enable you to report in person to the Chief of Staff.

4. For the duration of this duty you are brevetted to the rank of sublieutenant.

J. S. Busby, Wing Colonel (brevet)

For the Commanding General

First Endorsement:

1. Delivered (via courier)

Henry Marsten, Captain (brevet) Commanding 16th Gondola Combat Team

Clipped to the orders was a scrawled note which read:

P.S. Dear "Lieutenant,"

These are the silliest orders I have ever had to endorse. What the devil have you been up to? Did you marry one of the dragons? Or did you catch a Big Brass with his finger off his number? Anyway, have fun—and good hunting! Marsten

Don tucked the orders and the note into his pocket. Every now and then he would reach in and touch them.

The days trickled away; the dotted line got ever closer to Mars: and the whole group got more and more jumpy. Another date was posted on the mess hall wall, a date by which the Little David must be ready —if they were to arrive in time.

The calendar marked that deadline the day the ship was finally manned. At raise-ship-minus-twenty-minutes Don was still in Sir Isaac's study, his baggage (such as it was) already aboard. Saying goodbye to Sir Isaac, he discovered, was rather more difficult than he had expected it to be. His head was not cluttered with ideas about "father images" and the like; he was simply aware that this dragon was all the family he had, much more so than that remote pair on the planet where he was headed.

He was almost relieved when a glance at his watch told him that he was late. "Got to run," he said. "Nineteen minutes."

"Yes, my dear Donald. Your short-lived race must always live in frantic haste."

"Well—g'bye."

"Farewell, Mist on the Waters."

He stopped outside Sir Isaac's study to blow his nose and pull himself together. Isobel stepped out from behind a massive pillar. "Don—I wanted to say goodbye to you."

"Huh? Sure, sure—but aren't you coming out to see 'raise ship'?"

"No."

"Well, as you like, but I've got to hurry, Grandma."

"I told you to stop calling me 'Grandma'!"

"So you fibbed about your age. So you're stuck with it—Grandma."

"Don, you stubborn beast! Don—you come back. You understand me?"

"Why, sure! We'll be back in jig time."

"See that you do! You're not bright enough to take care of yourself. Well—Open sky!" She grabbed him by both ears and kissed him quickly, then ran away.

Don stared after her, rubbing his mouth. Girls, he reflected, were much odder than dragons. Probably another race entirely. He hurried on down to the takeoff point. The entire colony seemed to be there and he was the last of the crew to arrive, winning thereby a dirty look from Captain Rhodes, skipper of the Little David. Rhodes, once of Interplanet and now of the Middle Guard, had appeared three days ago; he had not been inclined to talk and had spent the whole time with Conrad. Don touched the pocket and wondered if Rhodes carried orders that read as oddly as his.

The Little David had been dragged up on shore, where she rested in skids. No catapult would be needed for her takeoff, nor was any available: the three shuttle catapults on Venus were all in the hands of the Federation forces. The ship had been concealed by a screen of boughs; these were now cut back, giving her open sky, room to lift.

Don looked at her, thinking that she looked more like an oversized and unusually ugly concrete mixer than a space ship. The roots of her amputated wings stubbed out sadly to port and starboard. Her needle nose had been trimmed off and replaced by a bulbous special radar housing. She was scarred here and there by the marks of cutting torches where modifications had been done hastily and with no attempt to pretty up, smooth out, and make shipshape after the surgery.

Her rocket tubes were gone and the space formerly occupied by rocket fuel tanks now held an atomic power pile, while a major part of what had been her passenger space was now taken up by a massive bulkhead, the antiradiation shield to protect the crew from the deadly emanations of the pile. All over her outer surface, disfiguring what had been sleek streamlines, were bulging discoids—"antennas" Conrad had called them, antennas used to strain the very shape of space. They did not look much like antennas to Don.

The Little David carried a crew of nine, Rhodes, Conrad, Harvey, and six others, all young and all on "makeelearnee"—except Roger Conrad who carried the undignified title of "Gadget Officer," that being shorter than "Officer in Charge of Special Appliances." She carried one passenger, Old Malath. He was not in sight and Don did not look for him; the after part of the remaining cabin space had been sealed off for his use and airconditioned thin, dry, and cold.

All were aboard, the lock was sealed, and Don sat down. Despite the space taken up by the new equipment enough passenger seats had been left in the little ship to accommodate them. Captain Rhodes settled himself in his control seat and barked, "Acceleration stations! Fasten beltsl" Don did so.

Rhodes turned to Conrad who was still standing. Conrad said conversationally, "About two minutes, gentlemen. Since we had no time for a test run, this will be a very interesting experiment. Any of three things can happen.

He paused.

Rhodes snapped, "Yes? Go on!"

"First, nothing might happen. We might bog down on a slight theoretical oversight. Second, it might work. And third—it might blow up." He grinned. "Anyone want to place a small bet?"

Nobody answered. He glanced down and said, "Okay, Captain—twist her tail!"

It seemed to Don that it had suddenly become night and that they had gone immediately into free fall. His stomach, long used to the fairly high gravity of Venus, lurched and complained. Conrad, not strapped down, was floating, anchored by one hand to his control board. "Sorry, gentlemen!" he said. "Slight oversight. Now let's adjust this locus to Mars normal, as an accommodation to our passenger." He fiddled with his dials.

Don's stomach went abruptly back into place as a quite satisfactory weight of more than one-third g took over. Conrad said, "Very well, Captain, you can let them unstrap."

Someone behind Don said, "What's the matter? Didn't it work?"

Conrad said, "Oh, yes, it worked. In fact we have been accelerating at about—" He stopped to study his dials. "—twenty gravities ever since we left the atmosphere."

The ship remained surrounded by darkness, cut off from the rest of the universe by what was inadequately described as a "discontinuity," save for a few minutes every other watch when Conrad cut the field to enable Captain Rhodes to see out and thereby take direct star sights. During these periods they were in free fall and the stars shone sharp through the ports. Then the darkness again would close in and the Little David would revert to a little world of its own.

Captain Rhodes showed a persisting tendency to swear softly to himself after each fix and to work his calculations through at least three times.

In between times Conrad conducted "gadget class" for as many hours each day as he could stand it. Don found most of the explanations as baffling as the one Conrad had given Phipps. "I just don't get it, Rog," he confessed after their instructor had been over the same point three times.

Conrad shrugged and grinned. "Don't let it throw you. By the time you have helped install the equipment in your own ship, you'll know it the way your foot knows your shoe. Meantime, let's run through it again."

Aside from instructions there was nothing to do and the ship was too small and too crowded in any case. A card game ran almost continuously. Don had very little money to start with; very soon he had none and was no longer part of the game. He slept and he thought.

Phipps had been right, he decided; travel at this speed would change things—people would go planet-jumping as casually as they now went from continent to continent on Earth. It would be like—well, like the change from sailing ships to transocean rockets, only the change would be overnight, instead of spread over three centuries.

Maybe he would go back to Earth someday; Earth had its points—horseback riding, for instance. He wondered if Lazy still remembered him?

He'd like to teach Isobel to ride a horse. He'd like to see her face when she first laid eyes on a horse!

One thing he knew: he would not stay on Earth, even if he did go back. Nor would he stay on Venus—nor on Mars. He knew now where he belonged—in space, where he was born. Any planet was merely a hotel to him; space was his home.

Maybe he would go out in the Pathfinder, out to the stars. He had a sneaking hunch that, if they came through this stunt alive, a member of the original crew of the Little David would be able to wangle it to be chosen for the Long Trip. Of course, the Pathfinder was limited to married couples only, but that was not an obstacle. He was certain that he would be married in time to qualify although he could not remember clearly just when he had come by that knowledge. And Isobel was the whither-thou-goest sort; she wouldn't hold him back. The Pathfinder would not leave right away in any case; they would wait to change over to the Horst-Milne-Conrad drive, once they knew about it.

In any event he meant to stir around a bit, do some traveling, once the war was over. They would surely have to transfer him to the High Guard when he got back, then High Guard experience would stand him in good stead when he was a discharged veteran. Come to think about it, maybe he was already in the High Guard, so to speak.

McMasters had certainly been right; there was just one way to get to Mars—in a spacing task force.

He looked around him. The inevitable card game was still in progress and two of his mates were shooting dice on the deckplates, the cubes spinning lazily in the low paragravity field. Conrad had opened up his chair and was stretched out asleep, his mouth open. He decided that it certainly did not look like a world-saving task force; the place had more the air of an unmade bed.

They were due to "come out" on the eleventh day, within easy free fall of Mars, and—if all guesses had been right—close by the Federation task force, making almost a photo finish with those ships. "Gadget class" gave way to drill at battle stations. Rhodes picked Art Frankel, who had had some shiphandling experience, as his copilot; Conrad was assisted by Franklyn Chiang, a physicist like himself. Of the other four, two were on radio, two on radar.

Don's battle station was a saddle amidships, back of the pilots' chairs—the "dead man's" seat. Here he guarded a springloaded demolition switch, a type of switch known through the centuries as a "deadman" switch for the contrary reason that it operated only if its operator were dead.

At first drill Conrad got the others squared away, then came back to Don's station. "You savvy what you are to do, Don?"

"Sure. I throw this switch to arm the bomb, then I hang onto the deadman switch."

"No, no! Grab the deadman switch first—then close the arming switch"

"Yes, sure. I just said it backwards."

"Be sure you don't do it backwards! Just remember this, Lieutenant: if you let go, everything does."

"Okay. Say, Rog, this thing triggers an A-bomb—right?"

"Wrong. We should waste so much money! But the load of H.E. in there is plenty for a little can like this, I assure you. So, anxious as we are to blow up this packet rather than let it be captured, don't let go of that switch otherwise. If you feel a need to scratch, rise above it."

Captain Rhodes came aft and with a motion of his head sent Conrad forward. He spoke to Don in a low voice, such that his words did not reach the others. "Harvey, are you satisfied with this assignment? You don't mind it?"

"No, I don't mind," Don answered. "I know the others all have more technical training than I have. This is my speed."

"That's not what I mean," the Captain corrected. "You could fill any of the other seats, except mine and Dr. Conrad's. I want to be sure you can do this job."

"I don't see why not. Grab onto this switch, and then close that one—and hang on for dear life. It sure doesn't take any higher mathematics to do that."

"That's still not what I mean. I don't know you, Harvey. I understand you have had combat experience. These others haven't—which is why you have this job. Those who do know you think you can do it. I'm not worried that you might forget to hang on; what I want to know is this: if it becomes necessary to let go of that switch, can you do it?"

Don answered almost at once—but not before there had been time for him to think of several things—Dr. Jefferson, who had almost certainly suicided, not simply died—Old Charlie with his mouth quivering but his cleaver hand steady and sure—and an undying voice ringing through the fog, "Venus and Freedom!"

"Guess I can if I have to."

"Good. I'm by no means sure that I could. I'm depending on you, sir, if worse comes to worst, not to let my ship be captured." He went forward.

Tension mounted, tempers got edgy. They had no way to be sure that they would come out near the Federation task force; that force might be using something other than what was assumed to be the maximum-performance orbit. They could not even be certain that the Federation forces were not already on Mars, already in command and difficult to dislodge. The Little David's laboratory miracles were designed for ship-to-ship encounter in space, not for mopping up on the surface of a planet.

Conrad had another worry, one that he did not voice, that the ship's weapons might not work as planned. More than any of the rest he knew the weakness of depending on theoretical predictions. He knew how frequently the most brilliant computations were confounded by previously unsuspected natural laws. There was no substitute for test—and these weapons had not been tested. He lost his habitual grin and even got into a bad-tempered difference of opinion with Rhodes as to the calculated time of "coming out."

The difference of opinion was finally settled; a half hour later Rhodes said quietly, "It's almost time, gentlemen. Battle stations." He went to his own seat, strapped himself in, and snapped, "Report!'"

"Copilot."

"Radio!"

"Radar!"

"Special weapons ready."

"Dead man!" Don finished.

There was a long wait while the seconds oozed slowly away. Rhodes spoke quietly into a microphone, warning Malath to be ready for free fall, then called out, "Stand by!" Don took a tighter grip on the demolition switch.

Suddenly he was weightless; ahead of him and in the passenger ports on each side the stars burst into being. He could not see Mars and decided that it must be "under" the ship. The Sun was somewhere aft; it was not in his eyes. But his view ahead was excellent; the Little David, having begun life as a winged shuttle, had an airplane-type conning port in front of the piloting chairs. Don's position let him see as clearly as Rhodes and his copilot and much better than could the others.

"Radar?" inquired Rhodes.

"Take it easy, Skipper. Even the speed of light is—Oh, oh! Blips!"

"Coordinates and range!"

"Theta three five seven point two; phi minus zero point eight; range radius six eight oh."

"I'm feeding it in automatically," Conrad cut in sharply.

"Tracking?"

"Not yet."

"In range?"

"No. I think we should sit tight and close range as much as possible. They may not have seen us."

They had slowed their headlong flight earlier to permit maneuvering; nevertheless they were closing with the "blips" at more than ninety miles a second. Don strained his eyes to try to make out the ships, if such the radar reflections were. No use—his protoplasmic scanners were no match for electronic ones.

They stayed that way, nerves on edge and stomachs tight, and range steadily closing, until it seemed that the blips must not be the task force, perhaps were even some wandering uncharted asteroid—when the radio alarm, sweeping automatically the communication frequencies, clangingly broke the silence. "Get it!" shouted Rhodes.

"Coming up." There was a short wait. "They demanded that we identify. They're our babies, all right."

"Switch it over here." Rhodes turned to Conrad. "How about it?"

"I ought to be closer. Stall 'em!" Conrad's face was grey and wet with sweat.

Rhodes touched a key and spoke into his mike. "What ship are you? Identify yourself."

The answer was amplified through the horn over the Captain's head. "Identify or be fired upon."

Rhodes glanced again at Conrad, who was too busy to look back. Rhodes spoke into the mike, "This is the destroyer Little David, commissioned privateer, Venus Republic. Surrender immediately."

Don strained his eyes again. It seemed to him that there were three new "stars" dead ahead.

The answer came back with hardly more than transmission delay. "Federation flagship Peacemaker to pirate ship Little David: surrender or be destroyed."

To Rhodes' inquiry Conrad turned a face contorted with uncertainty. "It's still pretty far. The track hunts on me. I might miss."

"No time! Go ahead!"

Don could see them now—ships, growing unbelievably. Then, most suddenly, one was a silver globe, then a second—and a third. A cluster of incredible, Gargantuan Christmas tree ornaments where had been three mighty warships. They continued to swell, drew to the left and flashed past the ship . . . the "battle" was over.

Conrad sighed shakily. "That's all, Captain." He turned and said, "Don, you'd make us all feel easier if you'd open that arming switch. We're not going to need it."

Mars swam below them, ruddy and beautiful. Schiaparelli Station, I. T. & T.'s powerful interplanetary radio, had already had a silvery "hat" placed on it to guard the secret of their strike; Captain Rhodes had spoken with a lesser station, warning of their arrival. In less than an hour they would ground near da Thon. Malath himself had come out of his icebox, no longer sick and weary but pert as a cricket, willing to risk the warm, thick, moist air of the cabin for a view of home.

Don climbed back into his battle-station saddle for a better view. The fabulous canali were already plain to the eye; he could see them cutting through the soft greens and the dominant orange and brick red. It was winter in the south; the planet wore its south pole cap jauntily, like a chef's hat. The fancy reminded him of Old Charlie; he thought of him with gentle melancholy, memory softened by all that had gone between.

Mars at last . . . he'd be seeing his parents perhaps before the day was out—and give his father the ring. This was certainly not the way they had planned it.

Next time he would try not to take the long way round.

Rolling Stones

I - THE UNHEAVENLY TWINS

The two brothers stood looking the old wreck over. 'Junk,' decided Castor.

'Not junk,' objected' Pollux. 'A jalopy - granted. A heap any way you look at it A clunker possibly. But not junk.'

'You're an optimist, Junior.' Both boys were fifteen; Castor was twenty minutes older than his brother.

'I'm a believer, Grandpa - and you had better be, too. Let me point out that we don't have money enough for anything better. Scared to gun it?'

Castor stared up the side of the ship. 'Not at all - because that thing will never again rise high enough to crash. We want a ship that will take us out to the Asteroids - right? This superannuated pogo stick wouldn't even take us to Earth.'

'It will when I get through hopping it up - with your thumb-fingered help. Let's look through it and see what it needs.'

Castor glanced at the sky. 'Its getting late.' He looked not at the Sun making long shadows on the lunar plain, but at Earth, reading the time from the sunset line now moving across the Pacific.

Look, Grandpa, are we buying a ship or are we getting to supper on time?'

Castor shrugged. 'As you say, Junior.' He lowered his antenna, then started swarming up the rope ladder left there for the accommodation of prospective customers. He used his hands only and despite his cumbersome vacuum suit his movements were easy and graceful.

Pollux swarmed after him. Castor cheered up a bit when they reached the control room. The ship had not been stripped for salvage as completely as had many of the ships on the lot. True, the ballistic computer was missing but the rest of the astrogation instruments were in place and the controls to the power room seemed to be complete. The space-battered old hulk was not a wreck, but merely obsolete. A hasty look at the power room seemed to confirm this.

Ten minutes later Castor, still mindful of supper, herded Pollux down the ladder. When Castor reached the ground Pollux said, 'Well?'

'Let me do the talking.'

The sales office of the lot was a bubble dome nearly a mile away; they moved toward it with the easy, fast lope of old Moon hands. The office airlock was marked by a huge sign:

DEALER DAN
THE SPACESHIP MAN
CRAFT OF ALL TYPES ** SCRAP METAL *** SPARE PARTS
FUELING & SERVICE
(AEC License No. 739024)

They cycled through the lock and unclamped each other's helmets. The outer office was crossed by a railing; back of it sat a girl receptionist. She was watching a newscast while buffing her nails. She spoke without taking her eyes off the TV tank:

'We're not buying anything, boys - nor hiring anybody.'

Castor said 'You sell spaceships?'

She looked up. 'Not often enough.'

'Then tell your boss we want to see him.'

Her eyebrows went up. 'Whom do you think you are kidding, sonny boy? Mr Ekizian is a busy man.'

Pollux said to Castor, 'Let's go over to the Hungarian, Cas. These people don't mean business.'

'Maybe you're right.'

The girl looked from one to the other, shrugged, and flipped a switch. 'Mr Ekizan - there are a couple of Boy Scouts out here who say they want to buy a spaceship. Do you want to bother with them?'

A deep voice responded, 'And why not? We got ships to sell' Shortly a baldheaded, portly man, dressed in a cigar and a wrinkled moonsuit came out of the inner office and rested his hands on the rail. He looked them over shrewdly but his voice was jovial. 'You wanted to see me?'

'You're the owner?' asked Castor.

'Dealer Dan Ekizian, the man himself. What's on your mind' boys? Time is money.'

'Your, secretary told you,' Castor said ungraciously. 'Spaceships.

Dealer Dan took his cigar out of his mouth and examined it. 'Really? What would you boys want with a spacehip?'

Pollux muttered something; Castor said, 'Do you usually do business out here?' He glanced at the girl.

Ekizan followed his glance. 'My mistake. Come inside.' He opened the gate for them, led them into his office, and seated them. He ceremoniously offered them cigars; the boys refused politely. 'Now out with it kids. Let's not joke.'

Castor repeated, 'Spaceships.'

He pursed his lips. 'A luxury liner, maybe? I haven't got one on the field at the moment but I can always broker a deal.' Pollux stood up. 'He's making fun of us, Cas. Let's go see the Hungarian.'

'Wait a moment Pol. Mr Ekizian, you've got a heap out there on the south side of the field, a class VII, model '93 Detroiter. What's your scrapmetal price on her and what does she mass?' The dealer looked surprised. 'That sweet little job? Why, I couldn't afford to let that go as scrap. And anyhow, even at scrap that would come to a lot of money. If it is metal you boys want' I got it. Just tell me how much and what sort'

'We were talking about that Detroiter.'

'I don't believe I've met you boys before?'

'Sorry, sir. I'm Castor Stone. This is my brother Pollux.'

'Glad to meet you, Mr Stone. Stone,.. Stone? Any relation to - The "Unheavenly Twins" - that's it.'

'Smile when you say that,' said Pollux.

'Shut up, Pol. We're the Stone twins.'

'The frostproof rebreather valve, you invented it, didn't you?'

'That's right.'

'Say' I got one in my own suit. A good gimmick - you boys are quite the mechanics.' He looked them over again. 'Maybe you were really serious about a ship.'

'Of course we were.'

'Hmm . . . you're not looking for scrap; you want something to get around it. I've got just the job for you, a General Motors Jumpbug, practically new. It's been out on one grubstake job to a couple of thorium prospectors and I had to reclaim it. The hold ain't even radiosative.'

'Not interested.'

'Better look at it. Automatic landing and three hops takes you right around the equator. Just the thing for a couple of lively, active boys.'

'About that Detroiter - what's your scrap price?'

Ekizian looked hurt. 'That's a deepspace vessel, son - It's no use to you, as a ship. And I can't let it go for scrap; that's a clean job. It was a family yacht - never been pushed over six g, never had an emergency landing. It's got hundreds of millions of miles still in it. I couldn't let you scrap that ship, even if you were to pay me the factory price. It would be a shame. I love ships. Now take this Jumpbug. . .'

'You can't sell that Detroiter as anything but scrap,' Castor answered. 'It's been sitting there two years that I know of. If you had hoped to sell her as a ship you wouldn't have salvaged the computer. She's pitted, her tubes are no good, and an overhaul would cost more than she's worth. Now what's her scrap price?'

Dealer Dan rocked back and forth in his chair; he seemed to be suffering. 'Scrap that ship? Just fuel her up and she's ready to go - Venus, Mars, even the Jovian satellites.'

'What's your cash price?'

'Cash?'

'Cash.'

Ekizian hesitated, then mentioned a price. Castor stood up and said, 'You were right, Pollux. Let's go see the Hungarian.'

The dealer looked pained. 'If I were to write it off for my own use, I couldn't cut that price - not in fairness to my partners.'

'Come on, Pol.'

'Look, boys, I can't let you go over to the Hungarian's. He'll cheat you.'

Pollux looked savage. 'Maybe he'll do it politely.'

'Shut *up,* Poll!' Castor went on, 'Sorry, Mr Ekizian, my brother isn't housebroken. But we can't do business.' He stood up.

'Wait a minute. That's a good valve you boys thought up. I use it; I feel I owe you something.' He named another and lower sum.

'Sorry. We can't afford it.' He started to follow Pollux out 'Wait!' Ekizian mentioned a third price. 'Cash,' he added.

'Of course. And you pay the sales tax?'

'Well . . . for a cash deal, yes.'

'Good.'

'Sit down, gentlemen. I'll call in my girl and we'll stat the papers.'

'No hurry,' answered Castor. 'We've still got to see what the Hungarian has on his lot - and the government salvage lot, too.'

'Huh? That price doesn't stand unless you deal right now. Dealer Dan, they call me. I got no time to waste dickering twice.'

'Nor have we. See you tomorrow. If it hasn't sold we can take up where we left off.'

'If you expect me to hold that price, I'll have to have a nominal option payment.'

'Oh, no, I wouldn't expect you to pass up a sale for us. If you can sell it by tomorrow, we wouldn't think of standing in your way. Come on, Pol.'

Ekizian shrugged. 'Been nice meeting you, boys.'

'Thank you, sir.'

As they closed the lock behind them and waited for it to cycle, Pollux said 'you should have paid him an option.'

His brother looked at him. 'You're retarded, Junior.'

On leaving Dealer Dan's office the boys headed for the spaceport, intending to catch the passenger tube back to the city, fifty miles west of the port. They had less than thirty minutes if they were to get home for supper on time - unimportant in itself but Castor disliked starting a family debate on the defensive over a side issue. He kept hurrying Pollux along.

Their route took them through the grounds of General Synthetics Corporation, square miles of giant cracking plants, sun screens, condensers, fractionating columns, all sorts of huge machinery to take advantage of the burning heat, the bitter cold, and the endless vacuum for industrial chemical engineering purposes - a Dantesque jungle of unlikely shapes. The boys paid no attention to it; they were used to it. They hurried down the company road in the flying leaps the Moon's low gravity permitted, making twenty miles an hour. Half way to the port they were overtaken by a company tractor; Pollux flagged it down.

As he ground to a stop, the driver spoke to them via his cab radio: 'What do you want?'

'Are you meeting the Terra shuttle?'

'Subject to the whims of fate - yes.'

'It's Jefferson,' said Pollux. 'Hey, Jeff - it's Cas and Pol. Drop us at the tube station, will you?'

'Climb on the rack. "Mind the volcano - come up the usual way."' As they did so he went on, 'What brings you two carrot-topped accident-prones to this far reach of culture?'

Castor hesitated and glanced at Pollux. They had known Jefferson James for some time, having bowled against him in the city league. He was an old Moon hand but not a native, having come to Luna before they were born to gather color for a novel. The novel was still unfinished.

Pollux nodded. Castor said, 'Jeff, can you keep a secret?'

'Certainly - but permit me to point out that these radios are not directional. See your attorney before admitting any criminal act or intention.'

Castor looked around; aside from two tractor trucks in the distance no one seemed to be in line-of-sight. 'We're going into business.'

'When were you out of it?'

'This is a new line - interplanetary trade. We're going to buy our own ship and run it ourselves.'

The driver whistled. 'Remind me to sell Four-Planet Export short. When does this blitz take place?'

'We're shopping for a ship now. Know of a good buy?'

'I'll alert my spies.' He shut up, being busy thereafter with the heavier traffic near the spaceport. Presently he said, 'Here's your stop.' As the boys climbed down from the rack of the truck he added, 'If you need a crewman, keep me in mind.'

'Okay, Jeff. And thanks for the lift.'

Despite the lift they were late. A squad of marine M.P.s heading into the city on duty preempted the first tube car; by the time the next arrived the ship from Earth had grounded and its passengers took priority Thereafter they got tangled with the changing shift from the synthetics plant. It was well past suppertime when they arrived at their family's apartment a half mile down inside Luna city

Mr Stone looked up as they came in 'Well! the star boarders,' he announced. He was sitting with a small recorder in his lap, a throat mike clipped to his neck.

'Dad' it was unavoidable,' Castor began. 'We -'

'It always is,' his father cut in. 'Never mind the details. Your dinner is in the cozy. I wanted to send it back but your mother went soft and didn't let me.'

Dr Stone looked up from the far end of the living room, where she was modelling a head of their older sister, Meade. 'Correction', she said. 'Your father went soft; I would have let you starve. Meade, quit turning your head.'

'Check,' announced their four-year old brother and got up from the floor where he had been playing chess with their grand mother. He ran towards them. 'Hey, Cas, Pol - where you been? Did you go to the port? Why didn't you take me? Did you bring me anything?'

Castor swung him up by his heels and held him upside down. 'Yes. No. Maybe. And why should we? Here, Pol - catch.' He sailed the child through the air; his twin reached out and caught him, still by the heels.

'Check yourself,' announced Grandmother, 'and mate in three moves. Shouldn't let your social life distract you from your gaane, Lowell.'

The youngster looked back at the board from his upside down position. 'Wrong, Hazel. Now I let you take my queen, then - *Blammie!'*

His grandmother looked again at the board. 'Huh? Wait a minute - suppose I refuse your queen, then - Why, the little scamp! He's trapped me again.

Meade said, 'Souldn't let him beat you so often, Hazel. It's not good for him.'

'Meade, for the ninth time, quit turning your head!'

'Sorry, Mother. Let's take a rest.'

Grandmother snorted. 'You don't think I let him beat me on purpose, do you? You play him; I am giving up the game for good.'

Meade answered just as her mother spoke; at the same time Pollux chucked the boy back at Castor. 'You - take him. I want to eat.' The child squealed. Mr Stone shouted, 'QUIET!'

'And stay quiet,' he went on, while unfastening the throat mike. 'How is a man to make a living in all this racket? This episode has to be done over completely, sent to New York. tomorrow, shot, canned, distributed, and on the channels by the end of the week. It's not possible.'

'Then don't do it,' Dr Stone answered serenely. 'Or work in your room - it's soundproof.'

Mr Stone turned to his wife. 'My dear, I've explained a thousand times that I can't work in there by myself. I get no stimulation. I fall asleep.'

Castor said, 'How's it going, Dad? Rough?'

'Well, now that you ask me, the villains are way ahead and I don't see a chance for our heroes.'

'I thought of a gimmick while Pol and I were out. You have this young kid you introduced into the story slide into the control room while everybody is asleep. They don't suspect him, see? - he's too young so they haven't put him in irons. Once in the control room - ' Castor stopped and looked crestfallen. 'No, it won't do; he's too young to handle the ship. He wouldn't know how.'

'Why do you say that?' his father objected. 'All I have to do is to plant that he has had a chance to. . . let me see -' He stopped; his face went blank. 'No,' he said presently.

'No good, huh?'

'Eh? What? It smells - but I think I can use it. Stevenson did something like it in *Treasure Island* - and I think he got it from Homer. Let's see; if we - ' He again went into his trance.

Pollux had opened the warming cupboard Castor dropped his baby brother on the floor and accepted a dinner pack from his twin. He opened it. 'Meat pie again,' he stated bleakly and sniffed it. 'Synthetic, too.'

'Say that over again and louder,' his sister urged him. 'I've been trying for weeks to get Mother to subscribe to another restaurant.'

'Don't talk, Meade,' Dr Stone answered. 'I'm modelling your mouth.'

Grandmother Stone snorted. 'You youngsters have it too easy. When I came to the Moon there was a time when we had nothing but soya beans and coffee powder for three months.'

Meade answered, 'Hazel, the last time you told us about that it was two months and it was tea instead of coffee.'

'Young lady, who's telling this lie? You, or me?' Hazel stood up and came over to her twin grandsons. 'What were you two doing on Dan Ekizian's lot?'

Castor looked at Pollux, who looked back. Castor said cautiously, 'Who told you that we were there?'

'Don't try to kid your grandmother. When you have been on -'

The entire family joined her in chorus: '"- on the Moon as long as I have!"'

Hazel sniffed. 'Sometimes I wonder why I married!' Her son said, 'Don't try to answer that question,' then continued to his sons, 'Well, what *were* you doing there?' Castor consulted Pollux by eye, then answered, 'Well, Dad, it's like this -'

His father nodded. 'Your best flights of imagination always start that way. Attend carefully, everybody.'

'Well, you know that money you are holding for us?'

'What about it?' 'Three per cent isn't very much.' Mr Stone shook his head vigorously. 'I will not invest your royalties in some wildcat stock. Financial genius may have skipped my generation but when I turn that money over to you, it will be intact'

'That's just it. It worries you. You could turn it over to us now and quit worrying about it.'

'No. You are too young.'

'We weren't too young to earn it'

His mother snickered. 'They got you, Roger. Come here and I'll see if I can staunch the blood'

Dr Stone said serenely, 'Don't heckle Roger when he is coping with the twins, Mother. Meade, turn a little to the left.'

Mr Stone answered, 'You've got a point there, Cas. But you may still be too young to hang on to it. What is this leading up to?'

Castor signalled with his eyes; Pollux took over. 'Dad, we've got a really swell chance to take that money and put it to work. Not a wildcat stock, not a stock at all. We'll have every penny right where we can see it, right where we could cash in on it at any time. And in the meantime we'll be making lots more money.'

'Hmmm...how?'

'We buy a ship and put it to work.'

His father opened his mouth; Castor cut in swiftly, 'We can pick up a Detroiter VII cheap and overhaul it ourselves; we won't be out a cent for wages.'

Pollux filled in without a break. 'You've said yourself, Dad, that we are both born mechaics; we've got the hands for it.'

Castor went on. 'We'd treat it like a baby because it would be our own.'

Pollux: 'We've both got both certificates, control and power. We wouldn't need any crew.'

Castor: 'No overhead - that's the beauty of it.'

Pollux: 'so we carry trade goods out to the Asteroids and we bring back a load of high-grade. We can't lose.'

Castor: 'Four hundred percent, maybe five hundred.'

Pollux: 'More like six hundred.'

Castor: 'And no worries for you.'

Pollux: 'And we'd be out of your hair.'

Castor: 'Not late for dinner.'

Pollux had his mouth open when his father again yelled, 'QUIET!' He went on, 'Edith, bring the barrel. This time we use it.' Mr Stone had a theory, often expressed, that boys should be raised in a barrel and fed through the bunghole. The barrel had no physical existence.

Dr Stone said, 'Yes, dear,' and went on modelling.

Grandmother Stone said, 'Don't waste your money on a Detroiter. They're unstable; the gyro system is no good. Wouldn't have one as a gift. Get a Douglas.'

Mr Stone turned to his mother. 'Hazel, if you are going to encourage the boys in this nonsense -'

'Not at all! Not at all! Merely intellectual discussion. Now with a Douglas they could make some money. A Douglas has a very favorable -'

'Hazel!'

His mother broke off, then said thoughtfully, as if to herself, 'I know there is free speech on the Moon: I wrote it into the charter myself.'

Roger Stone turned back to his sbns. 'See here, boys - when the Chamber of Commerce decided to include pilot training in their Youth-Welfare program I was all for it. I even favored it when they decided to issue junior licenses to anybody who graduated high in the course. When you two got your jets I was proud as could be. It's a young man's game; they license commercial pilots at eighteen and -'

'And they retire them at thirty,' added Castor. 'We haven't any time to waste. We'll be too old for the game before you know it.'

'Pipe down. I'll do the talking for a bit. If you think I'm going to draw that money out of the bank and let you two young yahoos go gallivanting around the system in a pile of sky junk that will probably blow the first time you go over two g's, you had better try another think. Besides, you're going down to Earth for school next September.'

'We've been to Earth,' answered Castor.

'We didn't like it' added Pollux.

'Too dirty

'Likewise too noisy.'

'Groundhogs everywhere,' Castor finished.

Mr Stone brushed it aside. 'Two weeks you were there - not time enough to find out what the place is like. You'll love it, once you get used to it. Learn to ride horseback, play baseball, see the Ocean'

'A lot of impure water,' Castor answered.

'Horses are to eat'

'Take baseball,' Castor continued. 'It's not practical. How can you figure a one-g trajectory and place your hand at the point of contact in the free-flight time between bases? We're not miracle men.'

'*I* played it.'

'But you grew up in a one-g field; you've got a distorted notion of physics. Anyhow, why would we want to learn to play baseball? When we come back, we wouldn't be able to play it here. Why, you might crack your helmet'

Mr Stone shook his head. 'Games aren't the point. Play baseball or not, as suits you. But you should get an education.'

'What does Luna City Technical lack that we need? And if so, why? After all, Dad, you were on the Board of Education'

'I was not; I was mayor.'

'Which made you a member ex-officio - Hazel told us.'

Mr Stone glanced at his mother; she was looking elsewhere. He went on, 'Tech is a good school, of its sort' but we don't pretend to offer everything at Tech. After all, the Moon is still an outpost, a frontier -'

'But you said' Pollux interrupted, 'in your retiring speech as mayor, that Luna City was the Athens of the future and the hope of the new age.'

'Poetic license. Tech is still not Harvard. Don't you boys want to see the world's great works of art? Don't you want to study the world's great literature?'

'We've read *lvanhoe,'* said Castor.

'And we don't want to read *The Mill on the Floss,'* added Pollux.

'We prefer your stuff.'

'My stuff? My stuff isn't literature. It's more of an animated comic strip.'

'We like it' Castor said firmly.

His father took a deep breath. 'Thank you. Which reminds me that I still have a full episode to sweat out tonight, so I will cut this discussion short. In the first place you can't touch the money without my thumbprint - from now on I am going to wear gloves. In the second place both of you are too young for an unlimited license.'

'You could get us a waiver for out-system. When we got back we'd probahly be old enough for unlimited.'

'You're too young!'

Castor said, 'Why, Dad, not half an hour ago you accepted a gimmick from me in which you were going to have an eleven-year-old kid driving a ship.'

'I'll raise his age!'

'It'll ruin your gimmick.'

'Confound it! That's just fiction - and poor fiction at that It's hokum, dreamed up to sell merchandise.' He suddenly looked suspiciously at his son. 'Cas, you planted that gimmick on me. Just to give yourself an argument in favor of this hair-brained scheme - didn't you?'

Castor looked pious. 'Why, Father, how could you think such a thing?'

'Don't Father me! I can tell a hawk from a handsaw.'

'Anybody can,' Grandmother Hazel commented. 'The Hawk class is a purely commercial type while the Hanshaw runabout is a sport job. Come to think about it, boys, a Hanshaw might be better than a Douglas. I like its fractional controls and -'

'Hazel!' 'napped her. son. 'Quit encouraging the boys. And quit showing off. You're not the only engineer in the family.'

'I'm the only good one,' she answered smugly.

'Oh, yes? Nobody ever complained about my work.'

'Then why did you quit?'

'You know why. Fiddle with finicky figures for months on end - and what have you got? A repair dock. Or a stamping mill. And who Ceres?'

'So you aren't an engineer. You're merely a man who knows engineering.'

'What about yourself? You didn't stick with it.'

'No,' she admitted, 'but my reasons were different. I saw three big, hairy, male men promoted over my head and not one of them could do a partial integration without a pencil. Presently I figured out that the Atomic Energy Commission had a bias on the subject of women no matter what the civil service rules said. So I took a job dealing blackjack. Luna City didn't offer much choice in those days - and I had you to support.'

The argument seemed about to die out; Castor judged it was time to mix it up again. 'Hazel, do you really think we should get a Hanshaw? I'm not sure we can afford it.'

'Well, now, you really need a third crewnaan for a -'

'Do you want to buy in?'

'Mr Stone interrupted. 'Hazel, I will not stand by and let you ecourage this. I'm putting my foot down.'

'You look silly standing there on one foot. Don't try to bring me up, Roger. At ninety-five my habits are fairly well set.'

'Ninety-five indeed! Last week you were eighty-five.'

'It's been a hard week. Back to our muttons - why don't you buy in with them? You could go along and keep them out of trouble.'

'What? Me?' Mr Stone took a deep breath. '(A) a marine guard couldn't keep these two junior-model Napoleons out of trouble. I know; Ive tried. (B) I do not like a Hanshaw; they are fuel hogs. (C) l have to turn out three episodes a week of *The Scourge of the Spaceways* - including one which must be taped tonight, if this family will ever quiet down!'

'Roger,' his mother answered' 'trouble in this family is like water for fish. And nobody asked you to buy a Hanshaw, As to your third point' give me a blank spool and I'll dictate the next three episodes tonight while I'm brushing my hair.' Hazel's hair was still thick and quite red. So far, no one had caught her dyeing it. 'It's about time you broke that contract anyway; you've won your bet.'

Her son winced. Two years before be had let himself be trapped into a bet that he could write better stuff than was being channeled up from Earth - and had gotten himself caught in a quicksand of fat checks and options. 'I can't afford to quit' he said feebly.

'What good is money if you don't have time to spend it? Give me that spool and the box'

'You can't write it.'

'Want to bet?'

Her son backed down; no one yet had won a bet with Hazel.

'That's beside the point I'm a family man; I've got Edith and Buster and Meade to think about, too.'

Meade turned her head again. 'If you're thinking about me, Daddy, I'd *like* to go. Why, I've never been any place - except that one trip to Venus and twice to New York.'

'Hold still. Meade,' Dr Stone said quietly. She went on to her husband, 'You know, Roger, I was thinking just the other day how caamped this apartment is. And we haven't been any place, as Meade says, since we got back from Venus.'

Mr Stone stared. 'You too? Edith, this apartment is bigger than any ship compartment; you know that.'

'Yes, but a ship seems bigger. In free fall one gets so much more use out of the room.'

'My deer, do I undersand that you are supporting this junket?'

'Oh' not at all! I was speaking in general terms. But you do sleep better aboard ship. You never snore in free fall.'

'I do not snore!'

Dr Stone did not answer. Hazel snickered. Pollux caught Castor's eye and Castor nodded; the two slipped quietly away to their own room. It was a lot of trouble to get mother involved in a family argument, but worth the effort; nothing important was ever decided until she joined in.

Meade tapped on their door a little later; Castor let her in and looked her over; she was dressed in the height of fashion for the American Old West. 'Square dancing again, huh?'

'Eliminations tonight. Look here, Cas, even if Daddy breaks loose from the money you two might be stymied by being underage for an unlimited license - right?'

'We figure on a waiver. They had also discussed blasting off without a waiver, but it did not seem the time to mention it.

'But you might not get it. Just bear in mind that I will be eighteen next week. Bye now!'

'Good night.'

When she had gone Pollux said, 'That's silly. She hasn't even taken her limited license.'

'No, but she's had astrogation in school and we could coach her.'

'Cas, you're crazy. We can't drag her all around the system; girls are a nuisance.'

'You've got that wrong, Junior. You mean "sisters" - girls are okay.'

Pollux considered this. 'Yeah, I guess you're right.' 'I'm always right.'

'Oh, so? How about the time you tried to use liquid air to -'

'Let's not be petty!'

Grandmother Hazel stuck her head in next. 'Just a quick battle report, boys. Your father is groggy but still fighting gamely.'

'Is he going to let us use the money?'

'Doesn't look like it, as now. Tell me, how much did Ekizian ask you for that Detroiter?'

Castor told her; she whistled. 'The gonoph,' she said softly. 'That unblushing groundhog - I'll have his license lifted.'

'Oh, we didn't agree to pay it.'

'Don't sign with him at all unless I'm at your elbow. I know where the body is buried.'

'Okay. Look, Hazel, you really think a Detroiter VII is unstable?'

She wrinkled her brow. 'Its gyros are too light for the ship's moment of inertia. I hate a ship that wobbles. If we could pick up a war-surplus triple-duo gyro system, cheap, you would have something. I'll inquire around.'

It was much later when Mr Stone looked in. 'Still awake, boys?'

'Oh, sure, come in.'

'About that matter we were discussing tonight -'

Pollux said, 'Do we get the money?'

Castor dug him in the ribs but it was too late. Their father said, 'I told you that was out. But I wanted to ask you: did you, when you were shopping around today, happen to ask, us, about any larger ships?'

Castor looked blank. 'Why, no sir. We couldn't afford anything larger could we, Pol?'

'Gee, no! Why do you ask, Dad?'

'Oh, nothing, nothing at all! Uh, good night.'

He left. The twins turned to each other and solemn!y shook hands.

II - A CASE FOR DRAMATIC LICENSE

At breakfast the next morning - 'morning' by Greenwich time, of course; itwas still late afternoon by local sun time and would be for a couple of days - the Stone family acted out the episode Hazel had dictated the night before of Mr Stone's marathon adventure serial. Grandma Hazel had stuck the spool of dictation into the autotyper as soon as she had gotten up; there was a typed copy for each of them. Even Buster had a small side to read and Hazel played several parts, crouching and jumping around and shifting her voice from rusty bass to soprano.

Everybody got into the act - everybody but Mr Stone; he listened with a dour try-to-make-me-laugh expression.

Hazel finished her grand cliff-hanging finale by knocking over her coffee She plucked the cup out of the air and had a napkin under the brown flood before it could reach the floor under the urge of the Moon's leisurely field. 'Well?' she said breathlessly to her son, while still panting from the Galactic Overlord's frantic attempts to escape a just fate. 'How about it? Isn't that a dilly? Did we scare the dickens out of 'em or didn't we?'

Roger Stone did not answer; he merely held his nose. Hazel looked amazed. 'You didn't *like* it? Why, Roger, I do believe you're jealous. To think I would raise a son with spirit so mean that he would be envious of his own mother!'

Buster spoke up. '*I* liked it Let's do that part over where I shoot the space pirate.' He pointed a finger and made a zizzing noise. 'Whee! Blood all over the bulkheads!'

'There's your answer, Roger. Your public. If Buster likes it, you're in.'

'I thought it was exciting,' Meade put in. 'What was wrong with it' Daddy?'

'Yes,' agreed Hazel belligerently. 'Go ahead. Tell us.'

'Very well. In the first place, spaceships do not make hundred-and eighty-degree turns.'

'This one does!'

'In the second place, what in blazes is this "Galactic Overlord" nonsense? When did he creep in?'

'Oh, that! Son, your show was dying on its feet, so I gave it a transfusion.'

'But "Galactic Overlords" - now, really! It's not only preposterous: it's been used over and over again.'

'Is that bad? Next week I'm going to equip *Hamlet* with atomic propulsion and stir it in with *The Comedy of Errors.* I suppose you think Shakespeare will sue me?'

'He will if he can stop spinning.' Roger Stone shrugged 'I'll send it in. There's no time left to do another one and the contract doesn't say it has to be good: it just says I have to deliver it. They'll rewrite it in New York anyway.'

His mother answered, 'Even money says your fan mail is up twenty-five per cent on this episode.'

'No, thank you. I don't want you wearing yourself out writing fan mail - not at your age.'

'What's wrong with my age? I used to paddle you twice a week and I can still do it. Come on; put up your dukes!'

'Too soon after breakfast.'

'Sissy! Pick your way of dying - Marquis of Queensbury, dockside, or kill-quick.'

'Send around your seconds; let's do this properly. In the meantime - ' He turned to his sons. 'Boys, have you any plans for today?'

Castor glanced at his brother, then said cautiously, 'well, we were thinking of doing a little more shopping for ships.

'I'll go with you.'

Pollux looked up sharply. 'You mean we get the money?' His brother glared at him. Their father answered, 'No, your money stays in the bank where it belongs.'

'Then why bother to shop?' He got an elbow in the ribs for this remark.

'I'm interested in seeing what the market has to offer,' Mr Stone answered. 'Coming, Edith?'

Dr Stone answered, 'I trust your judgement, my dear.'

Hazel gulped more coffee and stood up. 'I'm coming along.'

Buster bounced down out of his chair. 'Me, too!'

Dr. Stone stopped him. 'No, dear. Finish your oatmeal.'

'No! I'm going, too. Can't I, Grandma Hazel?'

Hazel considered it. Riding herd on the child outside the pressurised city was a full-time chore; he was not old enough to be trusted to handle his vacuum-suit controls properly. On this occasion she wanted to be free to give her full attention to other matters. 'I'm afraid not, Lowell. Tell you what, sugar, I'll keep my phone open and we'll play chess while I'm away.'

'It's no fun to play chess by telephone. I can't tell what you are thinking.'

Hazel stared at him. 'So that's it? I've suspected it for some time. Maybe I can win a game once. No, don't start whimpering - or I'll take your slide rule away from you for a week.' The child thought it over, shrugged, and his face became placid. Hazel turned to her son. 'Do you suppose he really does hear thoughts?'

Her son looked at his least son. 'I'm afraid to find out.' He sighed and added, 'Why couldn't I have been born into a nice, normal, stupid family? Your fault, Hazel.'

'His mother patted his arm. 'Don't fret' Roger. You pull down the average.'

'Hummph! Give me that spool. I'd better shoot it off to New York before I lose my nerve.'

Hazel fetched it; Mr Stone took it to the apartment phone, punched in the code for RCA New York with the combination set for highspeed transcription relay. As he slipped the spool into its socket he added, 'I shouldn't do this. In addition to that "Galactic Overlord" nonsense, Hazel, you messed up the continuity by killing off four of my standard characters.'

Hazel kept her eye on the spool; it had started to revolve. 'Don't worry about it. I've got it all worked out. You'll see.'

'Eh? What do you mean? Are you intending to write more episodes? I'm tempted to go limp and let you struggle with it - I'm sick of it and it would serve you right. Galactic Overlords indeed!'

His mother continued to watch the spinning spool in the telephone. At highspeed relay the thirty-minute spool zipped through in thirty seconds. Shortly it went spung! and popped up out of the socket; Hazel breathed relief. The episode was now either in New York, or was being held automatically in the Luna City telephone exchange, waiting for a break in the live Luna-to-Earth traffic. In either case it was out of reach, as impossible to recall as an angry word.

'Certainly I plan to do more episodes' she told him. 'Exactly seven, in fact.'

Huh! Why seven?'

Haven't you figued out why I am kiling off characters? Seven episodes is the end of this quarter and a new option date. This time they won't pick up your option because every last one of the characters will be dead and the story will be over. I'm taking you off the hook, son.'

'What? Hazel, you can't do that! Adventure serials never end.'

'Does it say so in your contract?'

'No, but -'

'You've been grousing about how you wanted to get off this golden treadmill. You would never have the courage to do it yourself, so your loving mother has come to the rescue. You're a free man again, Roger.'

'But -' His face relaxed. 'I suppose you're right Though I would prefer to commit suicide, even literary suicide, in my own way and at my own time. Mmm. .. see here, Hazel, when do you plan to kill off John Sterling?'

'Him? Why, Our Hero has to last until the final episode, naturally. He and the Galactic Overlord do each other in at the very end. Slow music.'

'Yes. Yes, surely... that's the way it would have to be. But you can't do it'

'Why not?'

'Because I insist on writing that scene myself. I've hated that mealymouthed Galahad ever since I thought him up. I'm not going to let anyone else have the fun of killing him; he's mine!'

His mother bowed. 'Your honour, sir.'

Mr Stone's face brightened; he reached for his pouch and slung it over his shoulder. 'And now let's look at some spaceships!'

'Geronimo!'

As the four left the apartment and stepped on the slid eway that would take them to the pressure lfft to the surface Pollux said to his grandmother, 'Hazel, what does "Geronimo" mean?'

'Ancient Druid phrase meaning "Let's get out of here even if we have to walk." So pick up your feet.'

III - THE SECONDHAND MARKET

They stopped at the Locker Rooms at East Lock and suited up. As usual, Hazel unbelted her gun and strapped it to her vacuum suit. None of the others was armed; aside from civic guards and military police no one went armed in Luna City at this late date except a few of the very oldtimers like Hazel herself. Castor said' 'Hazel, why do you bother with that?'

'To assert my right. Besides, I might meet a rattlesnake.'

'Rattlesnakes? On the Moon? Now, Hazel!'

'"Now, Hazel"' yourself. More rattlesnakes walking around on their hind legs than ever wriggled in the dust. Anyhow, do you remember the reason the White Knight gave Alice for keeping a mouse trap on his horse?'

'Uh, not exactly.'

'Look it up when we get home. You kids are ignorant Give me a hand with this helmet.'

The conversation stopped, as Buster was calling his grandmother and insisting that they start their game. Castor could read her lips through her helmet; when he had his own helmet in place and his suit radio switched on he could hear them arguing about which had the white men last game. Hazel was preoccupied thereafter as Buster, with the chess board in front of him, was intentionally hurrying the moves, whereas Hazel was kept busy visualising the board.

They had to wait at the lock for a load of tourists, just arrived in the morning shuttle from Earth, to spill out. One of two women passengers stopped and stared at them. 'Thelma', she said to her companion, 'that little man - he's wearing a *gun.'*

The other woman urged her along. 'Don't take notice', she said. 'It's not polite.' She went on, changing the subject 'I wonder where we can buy souvenir turtles around here? I promised Herbert.'

Hazel turned and glared at them; Mr Stone took her arm and urged her into the now empty lock. She continued to fume as the lock cycled. 'Groundhogs! Souvenir turtles indeed!'

'Mind your blood pressure, Hazel', her son advised.

'You mind yours.' She looked up at hiin and suddenly grinned. 'I should ha' drilled her, podnuh - like this.' She made a fast draw to demonstrate, then, before returning the weapon to its holster, opened the charge chamber and removed a cough drop. This she inserted through the pass valve of her helmet and caught it on her tonue. Sucking it, she continued. 'Just the same, son, that did it. Your mind may not be made up; mine is. Luna is getting to be like any other ant hill. I'm going out somewhere to find elbow room, about a quarter of a billion miles of it'

'How about your pension?'

'Pension be hanged! I got along all right before I had it' Hazel' along with the other remaining Founding Fathers - and mothers - of the lunar colony, had been awarded a lifetime pension from a grateful city. This might be for a long period, despite her age, as the normal human life span under the biologically easy conditions of the Moon's low gravity had yet to be determined; the Luna city geriatrics clinic regularly revised the estimate upwards.

She continued, 'How about you? Are you going to stay here, like a sardine in a can? Better grab your chance, son, before they run you for office again. Oueen to king's bishop three, Lowell.'

'We'll see. Pressure is down; let's get moving.'

Castor and Pollux carefully stayed out of the discussion; things were shaping up.

As well as Dealer Dan's lot, the government salvage yard and that of the Bankrupt Hungarian were, of course, close by the spaceport The Hungarian's lot sported an ancient sun-tarnished sign - BARGAINS! BARGAINS!! BARGAINS!!! GOING OUT OF BUSINESS - but there were no bargains there, as Mr Stone decided in ten minutes and Hazel in five. The government salvage yard held mostly robot freighters without living quarters - one-trip ships, the interplanetary equivalent of disarded packing cases - and obsolete military craft unsuited for most private uses. They ended up at Ekizian's lot.

Pollux headed at once for the ship he and his brother had picked out. His father immediately called him back 'Hey,' Pol! What's your hurry?'

'Don't you want to see our ship?'

'Your ship? Are you still laboring under the fancy that I am going to let you two refugees from a correction school buy that *Deiroiter?'*

'Huh? Then what did we come out here for?'

'I want to look at some ships. But I am not interested in a Detroiter VII.'

Pollux said, 'Huh! See here, Dad, we aren't going to settle for a jumpbug. We need a - 'The rest of his protest was cut off as Castor reached over and switched off his walkie-talkie; Castor picked it up:

'What sort of a ship, Dad? Pol and I have looked over most of these heaps, one time or another.'

'Well, nothing fancy. A conservative family job. Let's look at that Hanshaw up ahead.'

Hazel said' 'I thought you said Hanshaws were fuel hogs, Roger?'

'True, but they are very comfortable. You can't have everything.'

'Why not?'

Pollux had switched his radio back on immediately. He put in, 'Dad, we don't want a runabout. No cargo space.' Castor reached again for his belt switch; he shut up.

But Mr Stone answered him. 'Forget about cargo space. You two boys would lose your shirts if you attempted to compete with the sharp traders running around the system. I'm looking for a ship that will let the family make an occasional pleasure trip; I'm not in the market for a commercial freighter.'

Pollux shut up; they all went to the Hanshaw Mr Stone had pointed out and swarmed up into her control room. Hazel used both hands and feet in climbing the rope ladder but was only a little behind her descendants. Once they were in the ship she went down the hatch into the power room; the others looked over the control roof and the living quarters, combined in one compartment. The upper or bow end was the control station with couches for pilot and copilot. The lower or after end had two more acceleration couches for passengers, all four couches were reversible, for the ship could be tumbled in flight' caused to spin end over end to give the ship arificial 'gravity' through centrifugal force - in which case the forward direction would be 'down', just the opposite of the 'down' of flight under power.

Pollux looked over these arrangements with distaste. The notion of cluttering up a ship with gadgetry to coddle the tender stomachs of groundhogs disgusted him. No wonder Hanshaws were fuel hogs I

But his father thought differently. He was happily stretched out in the pilot's couch, fingering the controls. 'This baby might do', he announced, 'if the price is right.'

Castor said, 'I thought you wanted this for the family, 'I do.'

'Be pretty cramped in here once you rigged extra couches. Edith won't like that'

'You let me worry, about your mother. Anyhow, there are enough couches now.

'With only four? How do you figure?'

'Me, your mother, your grandmother, and Buster. If Meade is along we'll rig something for the baby. By which you may conclude that I am really serious about you two juvenile delinquents finishing your schooling. Now don't blow your safeties! - I have it in mind that you two can use this crate to run around in after you finish school. Or even during vacations, once you get your unlimited licenses. Fair enough?'

The twins gave him the worst sort of argument to answer; neither of them said anything. Their expressions said everything that was necessary. Their father went on, 'See here - I'm trying to be fair and I'm trying to. be generous. But how many boys your age do you know, or have even heard of, who have their own ship? None - right? You should get it through your heads that you are not supermen.'

Castor grabbed at it. 'How do you know that we are not "supermen"?'

Poliux followed through with, 'Conjecture, pure conjecture.' Before Mr Stone could think of an effective answer his mother poked her head up the power room hatch. Her expression seemed to say she had whiffed a very bad odor. Mr Stone said, 'What's the trouble, Hazel? Power plant on the blink?'

'"On the blink", he says! Why, I wouldn't lift this clunker at two gravities.'

'What's the matter with it?'

'I never saw a more disgracefully abused - No, I won't tell you. Inspect it yourself; you don't trust my engineering ability.'

'Now see here, Hazel, I've never told you I don't trust your engineering.'

'No, but you don't. Don't try to sweettalk me; I *know.* So check the power room yourself. Pretend I haven't seen it'

Her son turned away and headed for the outer door, saying huffily, 'I've never suggested that you did not know power plants. If you are talking about that Gantry design, that was ten years ago; by now you should have forgiven me for being right about it.'

To the surprise of the twins Hazel did not continue the argument but followed her son docilely into the air lock. Mr Stone started down the rope ladder; Castor pulled his grandmother aside, switched off both her radio and and pushed his helmet into contact with hers so that he might speak with her in private. 'Hazel, what was wrong with the power plant? Pol and I went through this ship last week - I didn't spot anything too bad.'

Hazel look at him pityingly. 'You've been losing sleep lately? It's obvious - only four couches.'

'Oh.' Castor switched on his radio and silently followed his brother and father to the ground.

Etched on the stern of the next ship they visited was *Cherub, Roma, Terra,* and she actually was of the Carlotti Motors *Angel* series, though she resembled very little the giant Archangels, She was short - barely a hundred fifty feet high - and slender, and she was at least twenty years old. Mr Stone had been reluctant to inspect her. 'She's too big for us', he protested' 'and I'm not looking for a cargo ship.'

'Too big how?' Hazel asked '"Too big" is a financial term, not a matter of size. And with her cargo hold empty, think how lively she'll be. I like a ship that jumps when I twist its tail - and so do you.'

'Mmmm, yes,' he admitted. 'Well, I suppose it doesn't cost anything to look her over.'

'You're talking saner every day, son.' Hazel reached for the rope lader.

The ship was old and old-fashioned and she had plied many a lonely million miles of space, but, thanks to the preservative qualities of the Moon's airless waste, she had not grown older since the last time her jets bad blasted. She had simply slumbered timelessly, waiting for someone to come along and appreciate her sleeping beauty. Her air had been. salvaged; there was no dust in her compartments. Many of her auxiliary fittings had been stripped and sold, but she herself was bright and clean and spaceworthy.

The light Hazel could see in her son's eyes she judged to be love at first sight. She hung back and signaled the twins to keep quiet. The open airlock had let them into the living quarters; a galley-saloon, two little staterooms, and a bunkroom. The control room was separate, above them, and was a combined conn. & comm. Roger Stone immeiately climbed into it.

Below the quarters was the cargo space and below that the power room. The little ship was a passenger-carrying freighter, conversely a pasenger ship with cargo space; it was this dual nature which had landed her, an unwanted orphan, in Dealer Dan's secondhand lot. Too slow when carrying cargo to compete with the express liners, she could carry too few passengers to make money without a load of freight, Although of sound construction she did not fit into the fiercely competitive business world.

The twins elected to go on down into the power room. Hazel poked around the living quarters, nodded approvingly at the galley, finally climbed up into the control room. There she found her son stretched out in the pilot's couch and fingering the controls. Hazel promptly swung herself into the copilot's couch, settled down in the bare rack - the pneumatic pads were missing - and turned her head toward Roger Stone. She called out 'All stations manned and ready, Captain !'

He looked at her and grinned. 'Stand by to raise ship!'

She answered, 'Board green! Clear from tower! Ready for count off!'

'Minus thirty! Twenty-nine - twentyeight - ' He broke off and added sheepishly, 'It *does* feel good.'

'You're dern tootin' it does. Let's grab ourselves a chunk of it before we're too old. This city life is getting us covered with moss.'

Roger Stone swung his long legs out of the pilot's couch. 'Um, maybe we should. Yes, we really should.'

Hazel's booted feet hit the deck plates by his. 'That's my boy! I'll raise you up to man size yet. Let's go see what the twins have taken apart.'

The twins were still in the power room. Roger went down first; he said to Castor, 'Well, son, how does it look? Will she raise high enough to crash?'

Castor wrinkled his forehead. 'We haven't found anything wrong, exactly, but they've taken her boost units out. The pile is just a shell.'

Hazel said, 'What do you expect? For 'em to leave "hot" stuff sitting in a decommissioned ship? In time the whole stern would be radioactive, even if somebody didn't steal it.

Her son answered, 'Quit showing off, Hazel, Cas knows that. We'll check the log data and get a metallurgical report later - if we ever talk business.'

Hazel answered, 'King's knight to queen bishop five. What's the matter, Roger? Cold feet?'

'No, I like this ship. . . but I don't know that I can pay for her. And even if she were a gift, it will cost a fortune to overhaul her and get her ready for space.'

'Pooh! I'll run the overhaul myself, with Cas and Pol to do the dirty work. Won't cost you anything but dockage. As for the price, we'll burn that bridge when we come to it.'

'I'll supervise the overhaul, myself.'

'Want to fight? Let's go down and find out just what inflated notions Dan Ekizian has this time. And remember - let me do the talking.'

'Now wait a minute - I never said I was going to buy this bucket.'

'Who said you were? But it doesn't cost anything to dicker. I can make Dan see reason.'

Dealer Dan Ekizian was glad to see them, doubly so when he found that they were interested, not in the Detroiter VII, but in a larger, more expensive ship. At Hazel's insistence she and Ekizian went into his inner office alone to discuss prices. Mr Stone let her get away with it, knowing that his mother drove a merciless bargain. The twins and he waited outside for quite a while; presently Mr Ekizian called his office girl in.

She came out a few minutes later, to be followed shortly by Ekizian and Hazel. 'It's all settled', she announced, looking smug.

The dealer smiled grudgingly around his cigar. 'Your mother is a very smart woman, Mister Mayor.'

'Take it easy!' Roger Stone protested. 'You are both mixed up in your timing. I'm no longer mayor, thank heaven - and nothing is settled yet. What are the terms?'

Ekizian glanced at Hazel, who pursed her lips. 'Well, now, son', she said slowly, 'it's like this. I'm too old a woman to fiddle around. I might die in bed, waiting for you to consider all sides of the question. So I bought it'

'You?'

'For all practical purposes. It's a syndicate. Dan puts up the ship; I wangle the cargo - and the boys and I take the stuff out to the Asteroids for a fat profit. I've always wanted to be a skipper.'

Castor and Pollux had been lounging in the background, listening and watching faces. At Hazel's announcement Pollux started to speak; Castor caught his eye and shook his head. Mr Stone said explosively, 'That's preposterous! I won't let you do it'

'I'm of age, son.' -

'Mr Ekizian, you must be out of your mind.'

The dealer took his cigar and stared at the end of it. 'Business is business.'

'Well...at least you won't get my boys mixed up in it That's out!'

'Mmm. . . ' said Hazel. 'Maybe. Maybe not. Let's ask them.'

'They're not of age.'

'No. . . not quite. But suppose they went into court and asked that I be appointed their guardian?'

Mr Stone listened to this quietly, then turned to his sons.'Cas. . .

Pol . . . did you frame this with your grandmother?'

Pollux answered, 'No, sir.'

'Would you do what she suggests?'

Castor answered, 'Now, Dad, you know we wouldn't like to do anything like that.'

'But would you do it, eh?'

'I didn't say so, sir.'

'Hmm - ' Mr Stone turned back. 'This is pure blackmail - and I won't stand for it. Mr Ekizian, you knew that I came in here to bid on that ship. You knew that my mother was to bargain for it as *my agent.* You both knew that - but you made a deal behind my back. Now either you set that so-called deal aside and we start over - or I haul both of you down to the Better Business Bureau.

Hazel was expressionless; Mr. Ekizan examined his rings.

'There's something in what you say, Mr Stone. Suppose we go inside and talk it over?'

'I think we had better.'

Hazel followed them in and plucked at her son's sleeve before he had a chance to start anydung. 'Roger? You really want to buy this ship?'

'I do.'

She pointed to papers spread on Ekizian's desk. 'Then just sign right there and stamp your thumb.'

He picked up the papers instead. They contained no suggestion of the deal Hazel had outlined; instead they conveyed to him all right, title and interest in the vessel he had just inspected, and at a price much lower than he had been prepared to pay. He did some hasty mental arithmetic and concluded that Hazel had not only gotten the ship at scrapmetal prices but also must have bulldozed Ekizian into discounting the price by what it would have cost him to cut the ship up into pieces for salvage.

In dead silence he reached for Mr Ekizian's desk stylus, signed his name, then carefully affixed his thumb print. He looked up and caught his mother's eye. 'Hazel, there is no honesty in you and you'll come to a bad end.'

She smiled. 'Roger, you do say the sweetest things.'

Mr Ekizian sighed. 'As I said, Mr Stone, your mother is a very smart woman. I offered her a partnership.'

'Then there *was* a deal?'

Oh, no, no, not that deal - I offered her a partnership in the lot.'

'But I didn't take it.' Hazel added. 'I want elbow room.'

Roger Stone grinned and shigged, stood up. 'Well, anyway - who's skipper now?'

'You are - Captain.'

As they came out both twins said, 'Dad' did you buy it?'

Hazel answered, 'Don't call him "Dad" - he prefers to be called "Captain".'

'Oh.'

'Likewise "Oh",' Pol repeated.

Dr Stone's only comment was, 'Yes, dear, I gave them notice on the lease.' Meade was almost incoherent; Lowell was incoherent After dinner Hazel and the twins took Meade and the baby out to see their ship; Dr Stone - who had shown no excitement even during the Great Meteor Shower - stayed home wrth her husband. He spent the time making lists of things that must be attended to, both in the city and on the ship itself, before they could leave. He finished by making a list that read as follows:

Myself - skipper
Castor - 1st officer & pilot
Meade - 2nd officer & asst. cook
Hazel - chief engineer
Pollux - asst. eng. & relief pilot
Edith - ship's surgeon & cook
Buster - 'supercargo'

He stared at it for a while, then said softly to himself, 'Something tells me this isn't going to work.'

IV - ASPECTS OF DOMESTIC ENGINEERING

Mr Stone did not show his ship's organisation bill to the rest of the family; he knew in his heart that the twins were coming along, but he was not ready to concede it publicly. The subject was not mentioned while they were overhauling the ship and getting it ready for space.

The twins did most of the work with Hazel supervising and their father, from time to time, arguing with her about her engineering decisions. When this happened the twins usually went ahead and did it in the way they thought it ought to be done. Neither of them had much confidence in the skill and knowledge of their elders; along with their great natural talent for mechanics and their general brilliance went a cocksure, half-baked conceit which led them to think that they knew a great deal more than they did.

This anarchistic and unstable condition came to a head over the overhaul of the intermediate injector sequence. Mr Stone had decreed, with Hazel concurring, that all parts which could be disassembled would so be, interior surfaces inspected, tolerances checked, and gaskets replaced with new ones. The intermediate sequence in this model was at comparatively low pressure; the gasketing was of silicone-silica laininate rather than wrung metal.

Spare gaskets were not available in Luna city, but had to be ordered up from Earth; this Mr Stone had done. But the old gaskets appeared to be in perfect condition, as Pollux pointed when they opened the sequence. 'Hazel, why don't we put these back in? They look brand new.'

His grandmother took one of the gaskets, looked it over, flexed it, and handed it back. 'Lots of life left in it; that's sure. Keep it for a spare.'

Castor said, 'That wasn't what Pol said. The new gaskets have to be flown from Rome to Pikes Peak, then jumped here. Might be three days, or it might be a week. And we can't do another thing until we get this mess cleaned up.'

'You can work in the control room. Your father wants all new parts on everything that wears out.'

'Oh, bother! Dad goes too much by the book; you've said so yourself.'

Hazel looked up at her grandson, bulky in his pressure suit. 'Listen, runt, your father is an A-one engineer. I'm privileged to criticise him; you aren't.'

Pollux cut in hastily, 'Just a Sec, Hazel, let's keep personalities out of this. I want your unbiased professional opimon; are those gaskets fit to put back in, or aren't they? Cross your heart and shame the devil.'

'Well. . . I say they are fit to use. You can tell your father I said so. He ought to be here any minute now; I expect he will agree.' She straightened up. 'I've got to go.'

Mr Stone failed to show up when expected. The twins fiddled around, doing a little prelimiharv work on the preheater. Finally Pollux said, 'What time is it?'

'Past four.'

'Dad won't show up this afternoon. Look, those gaskets are all right and, anyhow, two gets you five he'd never know the difference.'

'Well - he would okay them if he saw them.'

'Hand me that wrench.'

Hazel did show up again but by then they had the sequence put back together and had opened up the preheater. She did not ask about the injector sequence but got down on her belly with a flashlight and mirror and inspected the preheater's interior. Her frail body, although still agile as a cricket under the Moon's weak pull, was not up to heavy work with a wrench, but her eyes were sharper - and much more experienced - than those of the twins. Presently she wiggled out. 'Looks good,' she announced. 'We'll put it back together tomorrow. Let's go see what the cook ruined tonight.' She helped them disconnect their oxygen hoses from the ship's tank and reconnect to their back packs, then the three went down out of the ship and back to Luna City.

Dinner was monopolised by a hot argument over the next installment of *The Scourge of the Spaceways.* Hazel was still writing it but the entire family, with the exception of Dr Stone, felt free to insist on their own notions of just what forms of mayhem. and violence the characters should indulge in next. It was not until his first pipe after dinner that Mr Stone got around to inquiring about the day's progress.

Castor explained that they were about to close up the preheater. Mr Stone nodded. 'Moving right along - good! Wait a minute; You'll just have to tear it down again to put in the - Or did they send those gaskets out to the ship? I didn't think they had come in yet?'

'What gaskets?' Pollux said innocently. Hazel glanced quickly at him but said nothing.

'The gaskets for the intermediate injector sequence, of course.'

'Oh, *those!'* Pollux shrugged. 'They were okay, absolutely perfect to nine decimal places - so we put 'em back in.'

'Oh, you did? That's interesting. Tomorrow you can take them out again - and I'll stand over you when you put the new ones in.'

Castor took over. 'But Dad, Hazel said they were okay!'

Roger Stone looked at his mother. 'Well, Hazel?'

She hesitated. She knew that she had not been sufficiently emphatic in telling the twins that their father's engineering instructions were to be carried out to the letter; on the other hand she had told them to check with him. Or had she? 'The gaskets were okay, Roger. No harm done.'

He looked at her thoughtfully. 'So you saw fit to change my instructions? Hazel, are you itching to be left behind?'

She noted the ominously gentle tone of his voice and checked an angry reply. 'No,' she said simply.

'"No" what?'

'No, Captain.'

'Not captain yet, perhaps, but that's the general idea.' He turned to his sons. 'I wonder if you two yahoos understand the nature of this situation?'

Castor bit his lip. Pollux looked at his twin, then back at his father. 'Dad, *you're* the one who doesn't understand the nature of the situation. You're making a fuss over nothing. If it'll give you any satisfaction, we'll open it up again - but you'll simply see that we were right. If you had seen those gaskets, you would have passed them.'

'Probably. Almost certainly. But a skipper's orders as to how he wants his ship gotten ready for space are not subject to change by a dockyard mechanic - which is what you both rate at the moment.

Understand me?'

'Okay, so we should have waited: Tomorrow we'll open her up, you'll see that we were right and we'll close it up again.'

'Wrong. Tomorrow you will go out, open it up, and bring the old gaskets back to me. Then you will both stay right here at home until the new gaskets arrive. You can spend the time contemplating the notion that orders are meant to be carried out.'

Castor said, 'Now just a minute, Dad! You'll put us days behind.'

Pollux added, 'Not to mention the hours of work you are making us waste already.'

Castor: 'You can't expect us to get the ship ready if you insist on jiggling our elbows!'

Pollux: 'And don't forget the money we're saving you.'

Castor: 'Right! It's not costing you a square shilling!'

Pollux: 'And yet you pull this "regulation skipper" act on us.'

Castor: 'Discouraging! That's what it is!'

'Pipe down!' Without waiting for them to comply he stood up and grasped each of them by the scruff of his jacket. Luna's one-sixth gravity permitted him to straight-arm them both; he held them high up off the floor and wide apart. They struggled helplessly, unable to reach anything.

'Listen to me,' he ordered. 'Up to now I hadn't quite decided whether to let you two wild men go along or not. But now my mind's made up.'

There was a short silence from the two, then Pollux said mournfully, 'You mean we don't go?'

'I mean you do go. You need a taste of strict ship's discipline a durn sight more than you need to go to school; these modern schools aren't tough enough for the likes of you. I mean to run a taut ship - prompt, cheerful obedience, on the bounce! Or I throw the book at you. Understand me? Castor?'

'Uh, yes, sir.'

'Pollux?'

'Ayeaye,sir!'

'See that you remember it. Pull a fast-talk like that on me when we're in space and I'll stuff you down each other's throat.' He cracked their heads together smartly and threw them away.

The next day, on the way back from the field with the old gaskets, the twins stopped for a few minutes at the city library. They spent the four days they had to wait boning up on space law. They found it rather sobering reading, particularly the part which asserted that a commanding officer in space, acting independently, may and must maintain his authority against any who might attempt to usurp or dispute it. Some of the cited cases were quite grisly. They read of a freighter captain who, in his capacity as chief magistrate, had caused a mutineer to be shoved out an airlock, there to rupture his lungs in the vacuum of space, drown in his own blood

Pollux made a face. 'Grandpa,' he inquired, 'how would you like to be spaced?'

'No future in it. Thin stuff, vacuum. Low vitamin content'

'Maybe we had better be careful not to irritate Dad. This "captain" pose has gone to his head.'

'It's no pose. Once we raise ship it's legal as church on Sunday. But Dad won't space us, no matter what we do.'

'Don't count on it. Dad is a very tough hombre when he forgets that he's a loving father'

'Junior, you worry too much.'

'So? When you feel the pressure drop remember what I said.'

It had been early agreed that the ship could not stay the *Cherub.* There had been no such agreement on what the new name should be. After several noisy arguments Dr Stone, who herself had no special preference, suggested that they place a box on the dining table into which proposed names might be placed without debate. For one week the slips accumulated; then the box was opened.

Dr Stone wrote them down:

Dauntless Icarus
Jabberwock Susan B. Anthony
H. M. S. Pinafore Iron Duke
The Clunker Morning Star
Star Wagon Tumbleweed
Go-Devil Oom Paul
Onward Viking

'One would think,' Roger grumbled, 'that with all the self-declared big brains there are around this table someone would show some originality. Almost every name on the list can be found in the Big Register - half of them for ships still in commission. I move we strike out those tired, secondhand, wed-before names and consider only fresh ones.'

Hazel looked at him suspiciously. 'What ones will that leave?'

'Well -'

'You've looked them up, haven't you? I thought I caught you sneaking a look at the slips before breakfast.'

'Mother, 'your allegntion is immaterial, irrelevant, and unworthy of you.'

'But true. Okay; let's have a vote. Or does someone want to make a campaign speech?'

Dr Stone rapped on the table with her thimble. 'We'll vote. I've still got a medical association meeting to get to tonight.' As chairman she ruled that any name receiving less than two votes in the first round would be eliminated. Secret ballot was used; when Meade canvassed the vote, seven names had gotten one vote each, none had received two.

Roger Stone pushed back his chair. 'Agreement from this famlly is too much to expect . I'm going to bed. Tomorrow morning I'm going to register her as the R. S. *Deadlock.'*

'Daddy, you wouldn't!' Meade protested.

'Just watch me. The R. S. *Hair Shirt* might be better. Or the R. S. *Madhouse.'*

'Not bad,' agreed Hazel. 'It sounds like us. Never a dull moment.'

'I, for one,' retorted her son, 'could stand a little decent monotony.'

'Rubbish! We thrive on trouble. Do you want to get covered with moss?'

'What's "moss", Grandma Hazell?' Lowell demanded.

'Huh? It's. . . well, it's what rolling stones don't gather.'

Roger snapped his fingers. 'Hazel, you've just named the ship.'

'Eh? Come again.'

'The *Rolling Stones.* No, the *Rolling Stone.'*

Dr Stone glanced up. 'I like that, Roger.'

'Meade?'

'Sounds good, Daddy.'

'Hazel?'

'This is one of your brighter days, son.'

'Stripped of the implied insult, I take it that means "yes."'

'I don't like it,' objected Pollux. 'Castor and I plan to gather quite a bit of moss.'

'It's four to three, even if you get Buster to go along with you and your accomplice. Overruled. The *Roiling Stone* it is.'

Despite their great sizes and tremendous power spaceships are surprisingly simple machines. Every technology goes through three stages: first, a crudely simple and quite unsatisfactory gadget; second, an enormously complicated group of gadgets designed to overcome the shortcomings of the original and achieving thereby somewhat satisfactory performance through extremely complex compromise; third, a final stage of smooth simplicity and efficient performance based on correct understanding of natural laws and proper design therefrom.

In transportation, the ox cart and the rowboat represent the first stage of technology.

The second stage might well be represented by the automobiles of the middle twentieth century just before the opening of interplanetary travel. These unbelievable museum pieces were for the time fast, sleek and powerful -. but inside their skins were assembled a preposterous collection of mechanical buffoonery. The prime mover for such a juggernaut might have rested in one's lap; the rest of the mad assembly consisted of afterthoughts intended to correct the uncorrectable, to repair the original basic mistake in design - for automobiles and even the early aeroplanes were 'powered' (if one may call it that) by 'reciprocating engines.'

A reciprocating engine was a collection of miniature heat engines using (in a basically inefficient cycle) a small percentage of an exothermic chemical reaction, a reaction which was started and stopped every split second. Much of the heat was intentionally thrown away into a 'water jacket' or 'cooling system,' then wasted into the atmosphere through a heat exchanger.

What little was left caused blocks of metal to thump foolishly back-and-forth (hence the name 'reciprocating') and thence through a linkage to cause a shaft and flywheel to spin around. The flywheel (believe it if you can) had no gyroscopic function; it was used to store kinetic energy in a futile attempt to cover up the sins of reciprocation. The shaft at long last caused wheels to turn and thereby propelled this pile of junk over the countryside.

The prime mover was used only to accelerate and to overcome 'friction' - a concept then in much wider engineering use. To decelerate, stop, or turn the heroic human operator used their *own muscle power,* multiplied precariously through a series of levers.

Despite the name 'automobile' these vehicles had no autocontrol circuits; control, such as it was, was exercised second by second for hours on end by a human being peering out through a small pane of dirty silica glass, and judging unassisted and often disastrously his own motion and those of other objects. In almost all cases the operator had no notion of the kinetic energy stored in his missile and could not have written the basic equation. Newton's Laws of Motion were to him mysteries as profound as the meaning of the universe.

Nevertheless millions of these mechanical jokes swarmed over our home planet, dodging each other by inches or failing to dodge. None of them ever worked right; by their nature they could not work right; and they were constantly getting out of order. Their operators were usually mightily pleased when they worked at all. When they did not, which was every few hundred miles *(hundred,* not hundred thousand) they hired a member of a social class of arcane specialists to make inadequate and always expensive temporary repairs.

Despite their mad shortconaings, these 'automobiles' were the most characteristic form of wealth and the most cherished possessions of their time. Three whole generations were slaves to them.

The *Rolling Stone* was the third stage of technology. Her power plant was nearly 100% efficient, and, save for her gyroscopes, she contained almost no moving parts - the power plant used no moving parts at all; a rocket engine is the simplest of all possible heat engines. Castor and Pollux might have found themselves baffled by the legendary Model-T Ford automobile, but the *Roiling Stone* was not nearly that complex, she was merely much larger. Many of the fittings they had to handle were very massive, but the Moon's one-sixth gravity was an enormous advantage; only occasionally did they have to resort to handling equipment.

Having to wear a vacuum suit while doing mechanic's work was a handicap but they were not conscious of it. They had worn space suits whenever they were outside the pressurised underground city since before they could remember; they worked in them and wore them without thinking about them, as their grandfather had worn overalls. They conducted the entire overhaul without pressurising the ship because it was such a nuisance to have to be forever cycling an airlock, dressing and undressing, whenever they wanted anything outside the ship.

An IBM company representative from the city installed the new ballistic computer and ran it in, but after he had gone the boys took it apart and checked it throughout themselves, being darkly suspicious of any upcheck given by a manufacturer's employee. The ballistic computer of a space ship has to be right; without perfect performance from it a ship is a mad robot, certain to crash and kill its passengers. The new computer was of the standard 'I-tell-you-three-times' variety, a triple brain each third of which was capable of solving the whole problem; if one triplet failed, the other two would outvote it and cut it off from action, permitting thereby at least one perfect landing and a chance to correct the failure.

The twins made personally sure that the multiple brain was sane in all its three lobes, then, to their disgust, their father and grandinother checked everything that they had done.

The last casting had bein x-rayed, the last metallurgical report had been received from the spaceport laboratories, the last piece of tubing had been reinstalled and pressure tested; it was time to move the *Rolling Stone* from Dan Ekizian's lot to the port, where a technician of the Atomic Energy Commission - a grease monkey with a Ph.D - would install and seal the radioactive bricks which fired her 'boiler.' There, too, she would take on supplies and reactive mass, stablised monatomic hydrogen; in a pinch the *Rolling Stone* could eat anything, but she performed best on 'singleH.'

The night before the ship was to be towed to the spaceport the twins tackled their father on a subject dear to their hearts - money. Castor made an indirect approach. 'See here, Dad, we want to talk with you seriously.'

'So? Wait till I phone my lawyer.'

'Aw, Dad! Look, we just want to know whether or not you've made up your mind where we are going?'

'Eh? What do you care? I've already promised you that it will be some place new to you. We won't go to Earth, nor to Venus, not this trip.'

'Yes, but *where?'*

'I may just close my eyes, set up a prob on the computer by touch, and see what happens. If the prediction takes us close to any rock bigger than the ship, we'll scoot off and have a look at it. That's the way to enjoy traveling.'

Pollux said, 'But, Dad, you can't load a ship if you don't know where it's going.'

Castor glared at him; Roger Stone stared at him. 'Oh,' he said slowly, 'I begin to see. But don't worry about it. As skipper, it is my responsibility to see that we have whatever we need aboard before we blast.'

Dr Stone said quietly, 'Don't tease them, Roger.'

'I'm not teasing.'

'You're managing to tease me, Daddy,' Meade said suddenly. 'Let's settle it. I vote for Mars.'

Hazel said, 'The deuce it ain't!'

'Pipe down, Mother. Time was, when the senior male member of a family spoke, everybody did what he -'

'Roger, if you think I am going to roll over and play dead-'

'I said' "pipe down." But everybody in this family thinks it's funny to try to get around Pop. Meade sweettalks me. The twins fast-talk me. Buster yells until he gets what he wants. Hazel bullies me and pulls seniority.' He looked at his wife. 'You, too, Edith. You give in until you get your own way.'

'Yes, dear.'

'See what I mean? You all think papa is a schnook. But I'm not. I've got a soft head, a pliable nature, and probably the lowest I.Q. in the family, but this clambake is going to be run to suit me.'

'What's a clambake?' Lowell wanted to know.

'Keep your child quiet, Edith.'

'Yes, dear.'

'I'm going on a picnic, a *wanderjahr*. Anyone who wants to come along is invited. But I refuse to deviate by as much as a million miles from whatever trajectory suits me. I bought this ship from money earned in spite of the combined opposition of my whole family; I did not touch one thin credit of the money I hold in trust for our two young robber barons - and I don't propose to let them run the show.'

Dr Stone said quietly, 'They merely asked where we were going. I would like to know, too.'

'So they did. But why? Castor, you want to know so that you can figure a cargo, don't you?'

'Well - yes. Anything wrong with that? Unless we know what market we're taking it to, we won't know what to stock.'

'True enough. But I don't recall authorising any such commercial ventures. The *Rolling Stone* is a family yacht.'

Pollux cut in with, 'For the love of Pete, Dad! With all that cargo space just going to waste, you'd think that -'

'An empty hold gives us more cruising range.'

'But -'

'Take it easy. This subject is tabled for the moment. What do you two propose to do about your educations?'

Castor said, 'I thought that was settled. You said we could go along.'

'That part is settled. But we'll be coming back this way in a year or two. Are you prepared to go down to Earth to school then - and stay there - until you get your degrees?'

The twins looked at each other; neither one of them said anything. Hazel butted in: 'Quit being so offensively orthodox, Roger. I'll take over their educations. I'll give them the straight data. What they taught me in school durn near ruined me, before I got wise and started teaching myself.'

Roger Stone looked bleakly at his mother. 'You would teach them, all right. No, thanks, I prefer a somewhat more normal approach.'

'"Normal!" Roger, that's a word with no meaning.'

'Perhaps not, around here. But I'd like the twins to grow up as near normal as possible.'

'Roger, have you ever met any normal people? I never have. The so-called normal man is a figment of the imagination; every member of the human race, from Jojo the cave man right down to that final culmination of civilisation, namely me, has been as eooentric as a pet coon - once you caught him with his mask off.'

'I won't dispute the part about yourself.'

'It's true for everybody. You try to make the twins "normal" and you'll simply stunt their growth.'

Roger Stone stood up. 'That's enough. Castor, Pollux - come with me. Excuse us, everybody.'

'Yes, dear.'

'Sissy,' said Hazel. 'I was just warming up to my rebuttal.'

He led them into his study, closed the door. 'Sit down.'

The twins did so. 'Now we can settle this quietly. Boys, I'm quite serious about your educations. You can do what you like with your lives - turn pirate or get elected to the Grand Council. But I won't let you grow up ignorant.'

Castor answered, 'Sure, Dad, but we do study. We study all the time. You've said yourself that we are better engineers than half the young snots that come up from Earth.'

'Granted. But it's not enough. Oh, you can learn most things on your own but I want you to have a formal, disciplined, really sound grounding in mathematics.'

'Huh? Why, we cut our teeth on differential equations!'

Pollux added, "We know Hudson's Manual by heart We can do a triple integration in our heads faster than Hazel can. If there's one thing we *do* know, it's mathematics.'

Roger Stone shook his head sadly. 'You can count on your fingers but you can't reason. You probably think that the interval from zero to one is the same as the interval from ninetynine to one hundred.'

'Isn't it?'

'Is it? If so, can you prove it?' Their father reached up to the spindles on the wall, took down a book spool, and inserted it in the to his study projector. He spun the selector, stopped with a page displayed on the wall screen. It was a condensed chart of fields of mathematics invented, thus far by the human mind. 'Let's see you find your way around that page.'

The twins blinked at it. In the upper lefthand corner of the chart they spotted the names of subjects they had studied; the rest of the array was unknown territory; in most cases they did not even recognise the names of the subjects. In the ordinary engineering forms of the calculus they actually were adept; they had not been boasting. They knew enough of vector analysis to find their way around unassisted in electrical engineering and electronics; they knew classical geometry and trigonometry well enough for the astrogating of a space ship, and they had had enough of non-Euclidean geometry, tensor calculus, statistical mechanics, and quantum theory to get along with an atomic power plant

But it had never occurred to them that they had not yet really penetrated the enormous and magnificent field of mathematics.

'Dad' asked Pollux in a small voice, 'what's a "hyperideal"?'

'Time you found out.'

Castor looked quickly at his father. 'How many of these things have *you* studied, Dad?'

'Not enough. Not nearly enough. But my sons should know more than I do.'

It was agreed that the twins would study mathematics intensively the entire time the family was in space, and not simply under the casual supervision of their father and grandmother but formally and systematically through I.C.S. correspondence courses ordered up from

Earth. They would take with them spools enough to keep them busy for at least a year and mail their completed lessons from any port they might touch. Mr Stone was satisfied, being sure in his heart that any person skilled with mathematical tools could learn anything else he needed to know, with or without a master.

'Now, boys, about this matter of cargo-'

The twins waited; he went on: 'I'll lift the stuff for you -'

'Gee, Dad, that's swell!'

'- at cost.'

'You figure it and I'll check your figures. Don't try to flummox me or I'll stick on a penalty. If you're going to be businessmen, don't confuse the vocation with larceny.'

'Right, sir. Uh. . . we still can't order until we know where we are going.'

'True. Well, how would Mars suit you, as the first stop?'

'Mars?' Both boys got faraway looks in their eyes; their lips moved soundlessly.

'Well? Quit figuring your profits; you aren't there yet'

'Mars? Mars is fine, Dad!'

'Very well. One more thing: fail to keep up your studies and I won't let you sell a tin whistle.'

'Oh, we'll study!' The twins 'got out while they were ahead. Roger Stone looked at the closed door with a fond smile on his face, an expression he rarely let them see, Good boys! Thank heaven he hadn't been saddled with a couple of obedient, well-behaved little nincompoops!

When the twins reached their own room Castor got down the general catalog of Four Planets Export. Pollux said, 'Cas?'

'Don't bother me.'

'Have you ever noticed that Dad always gets pushed around until he gets his own way?'

'Sure. Hand me that slide rule.'

V - BICYCLES AND BLASTOFF

The *Rolling Stone* was moved over to the spaceport by the port's handling & spotting crew - over the protests of the twins, who wanted to rent a tractor and dolly and do it themselves. They offered to do so at half price, said price to be applied against freightage on their trade goods to Mars.

'Insurance?' inquired their father.

'Well, not exactly,' Pol answered.

"W'e'd carry our own risk,' added Castor. 'After all, we've got assets to cover it.'

But Roger Stone was not to be talked into it; he preferred, not unreasonably, to have the ticklish job done by bonded professionals. A spaceship on the ground is about as helpless and unwieldly as a beached whale. Sitting on her tail fins with her bow pointed at the sky and with her gyros dead a ship's precarious balance is protected by her lateral jacks, slanting down in three directions. To drag her to a new position requires those jacks to be raised clear of the ground, leaving the ship ready to topple, vuinerable to any jar. The *Rolling Stone* had to be moved thus through a pass in the hills to the port ten miles away. First she was jacked higher until her fins were two feet off the ground, then a broad dolly was backed under her; to this she was clamped. The bottom handler ran the tractor; the top handler took position in the control room. With his eyes on a bubble level, his helmet hooked by wire phone to his mate, he nursed a control stick which let him keep the ship upright. A hydraulic mercury capsule was under each fin of the ship; by tilting the stick the top handler could force pressure into any capsule to offset any slight irregularity in the road.

The twins followed the top handler up to his station. 'Looks easy,' remarked Pol while the handler tested his gear with the jack still down.

'It is easy,' agreed the handler, 'provided you can outguess the old girl and do the opposite of what she does - only do it first. Get out now; we're ready to start.'

'Look, Mister,' said Castor, we want to learn how. We'll hold still and keep quiet.'

'Not even strapped down - you might twitch an eyebrow and throw me half a degree off.'

'Well, for the love of Pete!' complained Pollux. 'Whose ship do you think this is?'

'Mine, for the time being,' the man answered without rancor. 'Now do you prefer to climb down, or simply be kicked clear of the ladder?'

The twins climbed out and clear, reluctantly but promptly. The *Rolling Stone,* designed for the meteoric speeds of open space, took off for the spaceport at a lively two miles an hour. It took most of a Greenwich day to get her there. There was a bad time in the pass when a slight moonquake set her to rocking, but the top handler had kept her jacks lowered as far as the terrain perraitted. She bounced once on number-two jack, then he caught her and she resumed her stately progress.

Seeing this, Pollux admitted to Castor that he was glad they had not gotten the contract. He was beginnng to realise that this was an estoric skill, like glassblowing or chipping flint arrowheads. He recalled stories of the Big Quake of '31 when nine ships had toppled.

No more temblors were experienced save for the microscopic shivers Luna continually experiences under the massive tidal strains of her eighty-times-heavier cousin Terra. The *Rolling Stone* rested at last on a launching flat on the east side of Leyport, her jet pointed down into splash baffles. Fuel bricks, water, and food, and she was ready to go - anywhere.

The mythical average man needs three and a half pounds of food each day, four pounds of water (for drinking, not washing), and thirty-four pounds of air. By the orbit most economical of fuel, the trip to Mars from the EarthMoon system takes thirty-seven weeks. Thus it would appear that the seven rolling Stones would require some seventy-five thousand pounds of consumable supplies for the trip, or about a ton a week.

Fortunately the truth was brighter or they would never have raised ground. Air and water in a space ship can be used over and over again with suitable refreshing, just as they can be on a planet. Uncounted trillions of animals for uncounted millions of years have breathed the air of Terra and drunk of her streams, yet air of Earth is still fresh and her rivers still run full. The Sun sucks clouds up from the ocean brine and drops it as sweet rain; the plants swarming over the cool green hills and lovely plains of Earth take the carbon dioxide of animal exhalation from the winds and convert it into carbohydrates, replacing it with fresh oxygen.

With suitable engineering a spaceship can be made to behave in the same way.

Water is distilled; with a universe of vacuum around the ship, low-temperature, low-pressure distillation is cheap and easy. Water is no problem - or, rather, shortage of water is no problem. The trick is to get rid of excess, for the human body creates water as one of the by-prodncts of its metabolism, in 'burning' the hydrogen in food. Carbon dioxide can be replaced by oxygen through 'soilless' gardening' - hydroponics. Short-jump ships, such as the EarthMoon shuttles, do not have such equipment, any more than a bicycle has staterooms or a galley, but the *Rolling Stone,* being a deepspace vessel, was equipped to do these things.

Instead of forty-one and a half pounds of supplies per person per day the *Rolling Stone* could get along with two; as a margin of safety and for luxury she carried about three, or a total of about eight tons, which included personal belongings. They would grow their own vegetables en route; most foods carried along would be dehydrated. Meade wanted them to carry shell eggs, but she was overruled both by the laws of physics and her mother - dried eggs weigh so very much less.

Baggage included a tossed salad of books as well as hundreds of the more usual flim spools. The entire family, save the twins tended to be old-fashioned about books; they liked books with covers, volumes one could hold in the lap. Film spools were not quite the same.

Roger Stone required his sons to submit lists of what they proposed to carry to Mars for trade. The first list thus submitted caused him to call them into conference. 'Castor, would you mind explaining this proposed manifest to me?'

'Huh? What is there to explain? Pol wrote it up. I thought it was clear enough.'

'I'm afraid it's entirely too clear. Why all this copper tubing?'

'Well, we picked it up as scrap. Always a good market for copper on Mass.'

'You mean you've already bought it?'

'Oh, no. We just put down a little to hold it.'

'Same for the valves and fittings I suppose?'

'Yes, sir.'

'That's good. Now these other items - cane sugar, wheat, dehydrated potatoes, polished rice. How about those?'

Pollux answered. 'Cas thought we ought to buy hardware; I favored foodstuffs. So compromised.'

'Why did you pick the foods you did?'

'Well, they're all things they grow in the city's airconditioning tanks, so they're cheap. No Earth imports on the list, you noticed.'

'I noticed.'

'But most of the stuff we raise here carries too high a percentage of water. You wouldn't want to carry *cucumbers* to Mars, would you?'

'I don't want to carry anything to Mars; I'm just going for the ride.' Mr Stone put down the cargo list, picked up another. 'Take a look at this.'

Pollux accepted it gingerly. 'What about it?'

'I used to be a pretty fair mechanic myself. I got to wondering just what one could build from the 'hardware' you two want to ship. I figure I could build a fair-sized still. With the "foodstuffs" you want to take a man would be in a position to make anything from vodka to grain alcohol. But I don't suppose you two young innocents noticed that?'

Castor looked at the list. 'Is that so?'

'Hmm - Tell me: did you plan to sell this stuff to the government import agency, or peddle it on the open market?'

'Well, Dad, you know you can't make much profit unless you deal on the open market.'

'So I thought. You didn't expect me to notice what the stuff was good for - and you didn't expect the customs agents on Mars to notice, either.' He looked them over. 'Boys, I intend to try to keep you out of prison until you are of age. After that I'll try to come to see you. each visiting day.' He chucked the list back at them. 'Guess again. And bear in mind that we raise ship Thursday - and that I don't care whether we carry cargo or not.'

Pollux said, 'Oh, for pity's sake, Dad! Abraham Lincoin used to sell whiskey. They taught us that in history. And Winston Churchill used to drink it.'

'And George Washington kept slaves,' his father agreed. 'None of which has anything to do with you two. So scram!'

They left his study and passed through the living room; Hazel was there. She cocked a brow at them. 'Did you get away withit?'

'No.'

She stuck out a hand, palm up. 'Pay me. And next time don't bet that you can outsmart your Pop. He's my boy.'

Cas and Pol settled on bicycles as their primary article of export. On both Mars and Luna prospecting by bicycle was much more efficient than prospecting on foot; on the Moon the oldstyle rock sleuth with nothing but his skis and Shank's ponies to enable him to scout the area where he had landed his jumpbug had almost disappeared; all the prospectors took bicycles along as a matter of course, just as they carried climbing ropes and spare oxygen. In the Moon's one-sixth gravity it was an easy matter to shift the bicycles to one's back and carry it over any obstacle to further progress.

Mars' surface gravity is more than twice that of Luna, but it is still only slightly more than one-third Earth normal, and Mars is a place of flat plains and very gentle slopes; a cyclist could maintain fifteen to twenty miles an hour. The solitary prospector, deprived of his traditional burro, found the bicycle an acceptable and reliable, if somewhat less congenial, substitute. A miner's bike would have looked odd in the streets of Stockholm; oversized wheels, doughnut sand tires, towing yoke and trailer, battery trickle charger, two-way radio, saddle bags, and Geiger-counter mount made it not the vehicle for a spin in the perk - but on Mars or on the Moon it fitted its purpose the way a canoe fits a Canadian stream.

Both planets imported their bicycles from Earth - until recently. Lunar Steel Products Corporation had lately begun making steel tubing, wire, and extrusions from native ore; Sears & Montgomery had subsidised an assembly plant to manufacture miner's bikes on the Moon under the trade name 'Lunocycle' and Looney bikes, using less than twenty per cent. by weight of parts raised up from Earth, undersold imported bikes by half.

Castor and Pollux decided to buy up secondhand bicycles which were consequently flooding the market and ship them to Mars. In interplanetary trade cost is always a matter of where a thing is gravity-wise - not how far away. Earth is a lovely planet but all her products lie at the bottom of a very deep 'gravity well,' deeper than that of Venus, enormously deeper than Luna's. Although Earth and Luna average exactly the same distance from Mars in miles, Luna is about five miles per second 'closer' to Mars in terms of fuel and shipping cost.

Roger Stone released just enough of their assets to cover the investment. They were still loading their collection of tired bikes late Wednesday afternoon, with Cas weighing them in, Meade recording for him, and Pol hoisting. Everything else had been loaded; trial weight with the crew aboard would be taken by the port weightmaster as soon as the bicycles were loaded Roger Stone supervised the stowing, he being personally responsible for the ship being balanced on take off.

Castor and he went down to help Pol unload the last flat. 'Some of these. seem hardly worth shipping,' Mr Stone remarked.

'Junk, if you ask me,' added Meade.

'Nobody asked you,' Pol told her.

'Keep a civil tongue in your head,' Meade answered sweetly, 'or go find yourself another secretary.'

'Stow it' Junior,' admonished Castor. 'Remember she's working free. Dad, I admit they aren't much to look at, but wait a bit. Pol and I will overhaul them and paint them in orbit. Plenty of time to do a good job - like new.'

'Mind you don't try to pass them off as new. But it looks to me as if you had taken too big a bite. When we get these inside and clamped down, there won't be room enough in the hold to swing a cat' much less do repair work. If you were thinking of monopolising the living space, consider it vetoed.'

'Why would anyone want to swing a cat?' asked Meade. 'The cat wouldn't like it. Speaking of that, why don't we take a cat?'

'No cats,' her father replied. 'I traveled with a cat once and I was in executive charge of its sand box. No cats.'

'Please, Cap'n Daddy! I saw the prettiest little kitten over at the Haileys' yesterday and -'

'No cats. And don't call me "Captain Daddy." One or the other, but the combination sounds silly.'

'Yes, Captain Daddy.'

'We weren't planning on using the living quarters.' Castor answered. 'Once we are in orbit we'll string 'em outside and set up shop in the hold. Plenty of room.'

A goodly portion of Luna City came out to see them off. The current mayor, the Honorable Thomas Beasley, was there to say good-by to Roger Stone; the few surviving members of the Founding Fathers turned out to honor Hazel. A delegation from the Junior League and what appeared to be approximately half of the male members of the senior class of City Tech showed up to mourn Meade's departure. She wept and hugged them all, but kissed none of them; kissing while wearing a space suit is a futile, low-caloric business.

The twins were attended only by a dealer who wanted his payment and wanted it now and wanted it in full.

Earth hung in half phase over them and long shadows of the Obelisk Mountains stretched over most of the field. The base of the *Rolling Stone* was floodlighted; her slender bow thrust high above the circle of brightness. Beyond her, masking the far side of the field, the peaks of Rodger Young Range were still shining in the light of the setting Sun. Glorious Orion glittered near Earth; north and east of it, handle touching the horizon, was the homely beauty of the Big Dipper. The arching depth of sky and the mighty and timeless monuments of the Moon dwarfed the helmeted, squatty figures at the base of the spaceship.

A searchlight on the distant control tower pointed at them; blinked red three times. Hazel turned to her son. 'Thirty minutes, Captain.'

'Right.' He whistled into his microphone. 'Silence, everyone! Please keep operational silence until you are underground Thanks for coming, everybody. Good-by!'

' 'Bye, Rog!' 'Good trip, folks!' 'Aloha!' 'Hurry back'

Their friends started filing down a ramp mto one of the field tunnels; Mr Stone turned to his family. 'Thirty minutes. Man the ship!'

'Aye aye, sir.'

Hazel started up the ladder with Pollux after her. She stopped suddenly, backed down and stepped on his fingers. 'Out of my way, youngster!' She jumped down and ran toward the group disappearing down the ramp. 'Hey, Tom! Beasley! Wait! Half a mo-'

The mayor paused and turned around; she thrust a package into his hand. 'Mail this stuff for me?'

'Certainly. Hazel.'

'That's a good boy. 'Bye!'

She came back to the ship; her son inquired, 'What was the sudden crisis, Hazel?'

'Six episodes. I stay up all night getting them ready. . . then I didn't even notice I still had 'em until I had trouble climbing with one hand.'

'Sure your head's on tight?'

'None of your lip, boy.'

'Get in the ship.'

'Aye aye, sir.'

Once they were all inboard the port's weightmaster made his final check, reading the scales on the launching flat under each fin, adding them together. 'Two and seven-tenths pounds under, Captain. Pretty close figuring.' He fastened trim weights in that amount to the foot of the ladder. 'Take it up.'

'Thank you, sir.' Roger Stone hauled up the ladder, gathered in the trim weights, and closed the door of the air lock. He let himself into the ship proper, closed and dogged the inner door behind him, then stuck his head up into the control room. Castor was already in the copilot's couch. 'Time?'

'Minus seventeen minutes, Captain.'

'She tracking?' He reached out and set the trim weights on a spindle at the central axis of the ship.

'Pretty as could be.' The main problem and the exact second of departure had been figured three weeks earlier; there is only one short period every twenty-six months' when a ship' may leave the Luna-Terra system for Mars by the most economical orbit. After trial weight had been taken the day before Captain Stone had figured his secondary problem, i.e., how much thrust for how long a period was required to put this particular ship into that orbit. It was the answer to this second problem which Castor was now tracking in the automatic pilot.

The first leg of the orbit would not be towards Mars but toward Earth, with a second critical period, as touchy as the take off, as they rounded Earth. Captain Stone frowned at the thought, then shrugged; that worry had to come later. 'Keep her tracking. I'm going below.'

He went down into the power room, his eyes glancing here and there as he went. Even to a merchant skipper, to whom it is routine, the last few minutes before blastoff are worry making. Blastoff for a spaceship has a parachute-jump quality; once you jump it is usually too late to correct any oversights. Space skippers suffer nightmares about misplaced decimal points.

Hazel and Pollux occupied the couches of the chief and assistant. Stone stuck his head down without going down. 'Power Room?'

'She'll be ready. I'm letting her warm slowly.'

Dr Stone, Meade, and Buster were riding out the lift in the bunkroom, for company; he stuck his head in. 'Everybody okay?'

His wife looked up from her couch. 'Certainly, dear. Lowell has had his injection.' Buster was stretched out on his back, strapped down and sleeping. He alone had never experienced acceleration thrust and free falling; his mother had decided to drug him lest he be frightened.

Roger Stone looked at his least son. 'I envy him.'

Meade sat up. 'Head pretty bad, Daddy?'

'I'll live. But today I regard farewell parties as much overrated affairs, especially for the guest of honor.'

The horn over his head said in Castor's voice, 'Want me to boost her, Dad? I feel fine.'

'Mind your own business, copilot. She still tracking?'

'Tracking, sir. Eleven minutes.'

Hazel's voice came out of the horn.' "The wages of sin are death".'

'Look who's talking! No more unauthorised chatter over the intercom. That's an order.'

'Aye aye, Captain.'

He started to leave; his wife stopped him. 'I want you to take this, dear.' She held out a capsule.

'I don't need it.'

'Take it.'

'Yes, Doctor darling.' He swallowed it, made a face, and went up to the control room. As he climbed into his couch he said, 'Call tower for clearance.'

'Aye aye, sir. *Rolling Stone,* Luna City registry, to Tower - request clearance to lift according to approved plan.'

'Tower to Rolling Stone - you are cleared to lift! 'Rolling Stone to Tower - roger!' Castor answered. Captain Stone looked over his board. All green, except one red light from power room which would not wink green until he told his mother to unlock the safety on the cadmium damper plates. He adjusted the microvernier on his tracking indicator, satisfied himself that the autopilot was tracking to perfection as Castor had reported. 'All stations, report in succession -power room !'

'She's sizzling, Skipper!' came back Hazel's reply.

'Passengers!'

'We're ready, Roger.' 'Copilot!'

'Clear and green, sir! Check off completed. Five minutes.'

'Strap down and report!'

'Power gang strapped.' - 'We're strapped, dear.' - 'Strapped, sir all stations.'

'Power room, unlock for lift.'

The last red light on his board winked green as Hazel reported, 'Power board unlocked, Skipper. Ready to blast.'

Another voice followed hers, more softly: 'Now I lay me down to sleep -'

'Shut up, Meade!' Roger Stone snapped. 'Copilot, commence the count!'

Castor started singsonging: 'Minus two minutes ten. . . minus two minutes. . . minus one minute fifty. . . minus one minute forty -'

Roger Stone felt his blood begin to pound and wished heartily that he had had the sense to come home early, even if the party had been in his honor.

'Minus one minute!. . . minus fifty-five. . . minus fifty -'

He braced his right hand with his forefinger over the manual firing key, ready to blast if the autopilot should fail - then quickly took it away. This was no military vessel! If it failed to fire, the thing to do was to cancel - not risk his wife and kids with imperfect machinery. After all, he held only a private license - 'Minus thiry-five. . . *half minute!'*

His head felt worse. Why leave a warm apartment to bounce around in a tin covered wagon?

'Twenty-*eight*, twenty-*sev'n,* twenty-*six* -'

Well, if anything went wrong, at least there wouldn't be any little orphans left around. The whole Stone family was here, root and branch. The rolling Stones -

'Nineteen. . . eighteen. . . seventeen -,

He didn't fancy going back and meeting all those people who had just come out to say good-by - telling them, 'It's like this: we swung and we missed -'

'Twelve! Eleven! and ten! and nine! '

He again placed his forefinger over the manual button, ready to stab.

'And *five!*

'And *four!*

'And *three!*

'And *two!*

'And - ' Castor's chant was blanked out by the blazing 'white noise' of the jet; the *Rolling Stone* cast herself into the void.

VI - BALLISIICS AND BUSTER

Blasting off from Luna is not the terrifying and oppressive experience that a lift from Earth is. The Moon's field is so weak, her gravity well so shallow, that a boost of one-g would suffice - just enough to produce Earth-normal weight.

Captain Stone chose to use two gravities, both to save time and to save fuel by getting quickly away from Luna - 'quickly' because any reactive mass spent simply to hold a spaceship up against the pull of a planet is an 'overhead' cost; it does nothing toward getting one where one wants to go. Furthermore, while the *Rolling Stone* would operate at low thrust she could do so only by being very wasteful of reactive mass, i.e., by not letting the atomic pile heat the hydrogen hot enough to produce a really efficient jet speed.

So he caused the *Stone* to boost at two gravities for slightly over two minutes. Two gravities - a mere nothing! The pressure felt by a wrestler pinned to the mat by the body of his opponent - the acceleration experienced by a child in a schoolyard swing - hardly more than the push resulting from standing up very suddenly.

But the Stone family had been living on Luna; all the children had been born there - two gravities was twelve times what they were used to.

Roger's headache, which had quieted under the sedative his wife had prescribed for him, broke out again with renewed strength. His chest felt caved in; he fought for breath and he had to read and reread the accelerometer to convince himself that the ship had not run wild.

After checking over his board and assuring himself that all was going according to plan even if it did feel like a major catastrophe he turned his head heavily. 'Cas? You all right?'

Castor gasped, 'Sure Skipper . . . tracking to flight plan.

'Very well, sir.' He turned his face to his intercom link. 'Edith -'

There was no answer. *'Edith"*

This time a strained voice replied, 'Yes, dear.'

'Are you alnght?'

'Yes, dear. Meade and I. . . are all right. The baby is having a bad time.'

He was about to call the power room when Castor reminded him of the passage of time. 'Twenty seconds! Nineteen! Eighteen -'

He tumed his eyes to the *brennschluss* timer and poised his hand on the cut-off switch, ready to choke the jet if the autopilot should fail. Across from him Castor covered him should *he* fail; below in the power room Hazel was doing the same thing, hand trembling over the cut-off.

As the timer flashed the last half second, as Castor shouted, *'Brennschluss!',* three hands slammed at three switches - but the autopilot had beaten them to it. The jet gasped as its liquid food was suddenly cut off from it; damper plates quenched the seeking neutrons in the atomic pile - and the *Stone* was in free orbit, falling toward Earth in a sudden, aching silence broken only by the whispering of the airconditioner.

Roger Stone reswallowed his stomach, 'Power room!' he rasped. 'Report!'

He could hear Hazel sighing heavily. 'Okay, son,' she said feebly, 'but mind that top step - it's a dilly!'

'Cas, call the port. Get a doppler check.'

'Aye aye, sir.' Castor called the radar & doppler station at Leyport. The *Rolling Stone* had all the usual radar and piloting instruments but a spaceship cannot possibly carry equipment of the size and accuracy of those mounted as pilot aids at all ports and satellite stations. *'Rolling Stone* to *Luna Pilot* - come in, *Luna Pilot.'* While he called he was warming up their own radar and doppler-radar, preparing to check the performance of their own instruments against the land-based standards. He did this without being told, it being a copilot's routine duty.

'Luna Pilot to *Rolling' Stone.'*

'Rolling Stone to *Luna Pilot* - request range, bearing and separation rate, and flight plan deviations, today's flight fourteen - plan as field; no variations.'

'We're on you. Stand by to record.'

'Standing by,' answered Castor and flipped the switch on the recorder. They were still so close to the Moon that the speed-of-light lag in transmission was unnoticeable.

A bored voice read off the reference time to the nearest half second, gave the double coordinates of their bearing in terms of system standard - corrected back to where the Moon *had been* at their blastoff - then gave their speed and distance relative to Luna with those figures also corrected back to where the Moon had been. The corrections were comparatively small since the Moon ambles along at less than two-thirds of a mile per second, but the corrections were utterly necessary. A pilot who disregarded them would find himself fetching up thousands or even millions of miles from his destination.

The operator added, 'Deviation from flight plan negligible. A very pretty departure, *Rolling Stone.'*

Castor thanked him and signed off. 'In the groove, Dad!'

'Good. Did you get our own readings?'

'Yes, sir. About seven seconds later than theirs.'

'Okay. Run 'em back on the flight line and apply the vectors. I want a check.' He looked more closely at his son; Castor's complexion was a delicate chartreuse. 'Say, didn't you take your pills?'

'Uh, yes, sir. It always hits me this way at first. I'll be all right.'

'You look like a week-old corpse.'

'You don't look so hot yourself, Dad.'

'I don't feel so hot, just betwen us. Can you work that prob, or do you want to sack in for a while?'

'Sure I can!'

'Well. . . mind your decimal places.'

'Aye aye, Captain.'

'I'm going aft.' He started to unstrap, saying into the intercom as he did so, 'All hands, unstrap at will. Power room, secure the pile and lock your board.'

Hazel answered, 'I heard the flight report' Skipper. Power room secured.'

'Don't anticipate my orders, Hazel - unless you want to walk back.'

She answered, 'I expressed myself poorly, Captain. What I mean to say is, we are now securing the power room, as per your orders, sir. There - it's done. Power room secured!'

'Very well, Chief.' He smiled grimly, having noted by the tell.tales on his own board that the first report was the correct one; she had secured as soon as she had known they were in the groove. Just as he had feared: playing skipper to a crew of rugged individualists was not going to be a picnic. He grasped the centre stanchion, twisted around so that he faced aft and floated through the hatch into the living quarters.

He wiggled into the bunkroom and checked himself by a handhold. His wife, daughter, and least child were all unstrapped. Dr Stone was manipulating the child's chest and stomach. He could not see just what she was doing but it was evident that Lowell had become violently nauseated - Meade, glassy-eyed herself, was steadying herself with one hand and trying to clean up the mess with the other. The boy was still unconscious.

Roger Stone felt suddenly worse himself. 'Good grief!' His wife looked over her shoulder. 'Get my injection kit,' she ordered. 'In the locker behind you. I've got to give him the antidote and get him awake. He keeps trying to swallow his tongue.'

He gulped. 'Yes, dear, Which antidote?'

'Neocaffeine - one c.c. *Move!'*

He found the case, loaded the injector, handed it to Dr Stone. She pressed it against the child's side. 'What else can I do?' he asked.

'Nothing.'

'Is he in any danger?'

'Not while I have an eye on him. Now get out and ask Hazel to come here.'

'Yes, dear. Right away.' He swam on aft, found his mother sitting in midair, looking pleased with herself. Pollux was still loosely secured to his control couch. 'Everything all right back here?' he asked.

'Sure. Why not? Except my assistant, maybe. I believe he wants off at the next stop.'

Pollux growled. 'I'm feeling okay. Quit riding me.'

Roger Stone said, 'Edith could use your help, Mother. Buster has thrown up all over the bunkroom.'

'Why, the little devil! He didn't have a thing to eat today; I rode herd on him myself.'

'You must have let him out of your sight for a few minutes, from the evidence. Better go give Edith a hand.'

'To hear is to obey, Master.' She kicked one heel against the bulkhead behind her and zipped out the hatch. Roger turned to his son.

'How's it going?'

'I'll be all right in a couple of hours. It's just one of those things you have to go through with, like brushing your teeth.'

'Check. I'd like to rent a small planet myself. Have you written up the engineering log?'

'Not yet.'

'Do so. It will take your mind off your stomach.' Roger Stone went forward again and looked into the bunkroom. Lowell was awake and crying; Edith had him sheeted to a bunk to give him a feeling of pressure and stability.

The child wailed, 'Mama! Make it hold *still'*

'Shush, dear. You're all right. Mother is here,'

'I want to go *home!'*

She did not answer but caressed his forehead. Roger Stone backed hastily out and pulled himself forward.

By supper time all hands except Lowell were over the effects of free fall - a sensation exactly like stepping off into an open elevator shaft in the dark. Nevertheless no one wanted much to eat; Dr Stone limited the menu to a clear soup, crackers, and stewed dried apricots. Ice cream was available but there were no takers.

Except for the baby none of them had any reason to expect more than minor and temporary discomfort from the change from planet-surface weight to the endless falling of free orbit. Their stomachs and the semicircular canals of their ears had been through the ordeal before; they were inured to it, salted.

Lowell was not used to it; his physical being rebelled against it, nor was he old enough to meet it calmly and without fear. He cried and made himseff worse, alternating that with gagging and choking. Hazel and Meade took turns trying to quiet him. Meade finished her skimpy dinner and relieved the watch; when Hazel came into the control room where they were eating Roger Stone said, 'How is he now?'

Hazel shrugged. 'I tried to get him to play chess with me. He spat in my face.'

'He must be getting better.'

'Not so you could notice it.'

Castor said, 'Gee whiz, Mother, can't you dope him up till he gets his balance?'

'No,' answered Dr Stone, 'I'm giving him the highest dosage now that his body mass will tolerate.'

'How long do you think it will take him to snap out of it?' asked her husband.

'I can't make a prediction. Ordinarily children adapt more readily than adults, as you know, dear - but we know also that some people never do adapt. They simply are constitutionally unable to go out into space.'

Pollux let his jaw sag. 'You mean Buster is a natural-born *groundhog?'* He made the word sound like both a crippling disability and a disgrace.

'Pipe down,' his father said sharply.

'I mean nothing of the sort,' his mother said crisply. 'Lowell is having a bad time but he may adjust very soon.'

There was glum silence for some minutes. Pollux refilled his soup bag, got himself some crackers, and eased back to his perch with one leg hooked around a stanchion. He glanced at Castor; the two engaged in a conversation that consisted entirely of facial expressions and shrugs. Their father looked at them and looked away; the twins often talked to each other that way; the code - if it was a code - could not be read by anyone else. He turned to his wife. 'Edith, do you honestly think there is a chance that Lowell may not adjust?'

'A chance, of course.' She did not elaborate, nor did she need to. Spacesickness like seasickness does not itself kill, but starvation and exhaustion do.

Castor whistled. 'A fine time to find it out, after it's too late. We're akeady in orbit for Mars.'

Hazel said sharply. 'You know better than that, Castor.'

'Huh?'

'Of course, dopy,' his twin answered. 'We'll have to tack back.' :1

'Oh.' Castor frowned. 'I forgot for the moment that this was a two-legged jump.' He sighed. 'Well, that's that. I guess we go back.' There was one point and one only at which they could decide to return to the Moon. They were falling now toward Earth in a conventional 'S-orbit" practically a straight line. They would pass very close to Earth in an hyperboloid at better than five miles per second, Earth relative. To continue to Mars they planned to increase this speed by firing the jet at the point of closest approach, falling thereby into an ellipsoid, relative to the Sun, which would let them fall to a rendezvous with Mars. They could reverse this maneuver, check their plunging progress by firing the jet against their motion and thereby force the *Stone* into an ellipsoid relative to Earth, a curve which, if correctly calculated, would take them back to Luna, back home before their baby brother could starve or wear himself out with retching. 'Yep, that's that,' agreed Pollux. He suddenly grinned. 'Anybody want to buy a load of bicycles? Cheap?'

'Don't be in too big a hurry to liquidate,' his father told him, 'but we appreciate your attitude. Edith, what do you think?'

'I say we mustn't take any chances,' announced Hazel. 'That baby is sick.'

Dr Stone hesitated: 'Roger, how long is it to perigee?'

He glanced at his control board. 'About thirty-five hours.'

'Why don't you prepare both maneuvers? Then we will not have to decide until it's time to turn ship.'

'That makes sense, Hazel, you and Castor work the homing problem; Pol and I will work the Mars vector. First approximations only; we'll correct when we're closer. Everyone work independently, then we'll swap and check. Mind your decimals!'

'You mind *yours.'* Hazel answered.

Castor gave his father a sly grin. 'You picked the easy one, eh, Dad?'

His father looked at him. 'Is it too hard for you? Do you want to swap?'

'Oh, no, Sir! I can do it.'

'Then get on with it - and bear in mind you are a crew member in space.'

'Aye aye, sir.'

He had in fact 'picked the easy one'; the basic tack-around-Earth-for-Mars problem had been solved by the big computers of Luna Pilot Station before they blasted off. To be sure, Luna Pilot's answer would have to be revised to fit the inevitable errors, or deviations from flight plan, that would show up when they reached perigee rounding Earth - they might be too high, too low, too fast, too slow, or headed somewhat differently from the theoretical curve which had bem computed for them. In fact they could be sure to be wrong in all three factors; the tiniest of errors at blastoff had a quarter of a million miles in which to multiply.

But nothing could be done to compute the corrections for those errors for the next fifteen or twenty hours; the deviations had to be allowed to grow before they could be measured accurately.

But the blast back to shape an ellipsoid home to Luna was a brand-new, unpremeditated problem. Captain Stone had not refused it out of laziness; he intended to do both problems but had kept his intention to himself. In the meantime he had another worry; strung out behind him were several more ships, all headed for Mars. For the next several days there would be frequent departures from the Moon, all ships taking advantage of the one favorable period in every twenty-six months when the passage to Mars was relatively 'cheap', i.e., when the minimum-fuel ellipse tangent to both planet's orbits would actually make rendezvous with Mars rather than arrive foolishly at some totally untenanted part of Mars' orbit. Except for military vessels and super expensive passenger-ships, all traffic for Mars left at this one time.

During the four-day period bracketing the ideal instant of departure ships leaving Leyport paid a fancy premium for the privilege over and above the standard service fee. Only a large ship could afford such a fee; the saving in cost of singleH reactive mass had to be greater than the fee. The *Rolling Stone* had departed just before the premium charge went into effect; consequently she had trailing her like beads on a string a round dozen of ships, all headed down to Earth, to tack around her toward Mars.

If the *Rolling Stone* vectored back and shaped course for Luna rather than Mars, there was a possibility of traffic trouble.

Collisions between spaceships are almost unheard of; space is very large and ships are very tiny. But they are possible, particularly when many ships are doing much the same thing at the same time ia the same region of space. Spacemen won't forget the *Rising Star* and the patrol vessel *Trygve Lie* - four hundred and seven dead, no survivors.

Ships for Mars would be departing Luna for the next three days and more; the *Rolling Stone,* in rounding Earth and heading back to Luna (toward where Luna would be on her arrival) would cut diagonally across their paths. Besides these hazards, there were Earth's three radio-satellites and her satellite space station; each ship's flight plan, as approved by Luna Pilot Station, took into consideration these four orbits, but the possible emergency maneuver of the *Rolling Stone* had had no such safety check. Roger Stone mentally chewed his nails at the possibility that Traffic Control might refuse permission for the Rolling *Stone* to change its approved flight plan - which they would do if there was the slightest possibility of collision, sick child or no.

And Captain Stone would ignore their refusal, risk collision and take his child home - there to lose his pilot's license certainly and to face a stiff sentence from the Admiralty court possibly.

Besides the space station and the radio satellites there were the robot atom-bomb peace rockets of the Patrol, circling the Earth from pole to pole, but it was most unlikely that the *Rolling Stone's* path would intersect one of their orbits; they moved just outside the atmosphere, lower than a spaceship was allowed to go other than in landing, whereas in order to tack the *Rolling Stone* would necessarily go inside the orbits of the radio satellites and that of the space station wait a minute - Roger Stone thought over that last idea. Would it be possible to match in with the space station instead of going back to Luna?

If he could, he could get Lowell back to weight a couple of days sooner - in the spinning part of the space station!

The ballistic computer was not in use; Castor and Hazel were still in the tedious process of setting up their problems. Captain Stone moved to it and started making a rough set-up directly on the computer itself, ignoring the niceties of ballistics, simply asking the machine, 'Can this, or can this not, be done?'

Half an hour later he gave up, let his shoulders sag. Oh, yes, he could match in with the space station's orbit - but at best only at a point almost a hundred degrees away from the station. Even the most lavish expenditure of reaction mass would not permit him to reach the station itself.

He cleared the computer almost violently. Hazel glanced toward him. 'What's eating you, son?'

'I thought we might make port at the station. We can't.'

'I could have told you that'

He did not answer but went aft. Lowell, he found, was as sick as ever.

Earth was shouldering into the starboard port, great and round and lovely; they were approaching her rapidly, less than ten hours from the critical point at which they must maneuver, one way or the other. Hazel's emergency flight plan, checked and rechecked by the Captain, had been radioed to Traffic Control. They were all resigned to a return to Luna; nevertheless Pollux was, with the help of Quito Pilot, Ecuador, checking their deviations from the original flight plan and setting up the problem of preparing a final ballistic for Mars.

Dr Stone came into the control room, poised near the hatch, caught her husband's eye and beckoned him to come with her.

He floated after her into their stateroom. 'What is it?' he asked. 'Is Lowell worse?'

'No, he's better.'

'Eh?'

'Dear, I don't think he was spacesick at all.'

'What's that?'

'Oh, a little bit, perhaps. But I think his symptoms were largely allergy; I think he is sensitive to the sedative.'

'Huh? I never heard of anyone being sensitive to that stuff before.'

'Neither have I, but there can always be a first time I withdrew the drug several hours ago since it did not seem to help him. His symptoms eased off gradually and his pulse is better now.'

'Is he okay? Is it. safe to go on to Mars?'

'Too early to say. I'd like to keep him under observation another day or two.'

'But - Edith, you know that's impossible. I've got to maneuver.' He was wretched from strain and lack of sleep; neither had slept since blastoff more than twenty-four hours earlier.

'Yes, I know. Give me thirty minutes warning before you must have an answer. I'll decide then.'

'Okay. I'm sorry I snapped at you.'

'Dear Roger!'

Before they were ready to 'round the corner' on their swing past Earth the child was much better. His mother kept him under a light hypnotic for several hours; when he woke from it he demanded food. She tried letting him have a few mouthfuls of custard; he choked on the first bite but that was simply mechanical trouble with no gravity - on the second bite he learned how to swallow and kept it down.

He kept several more down and was still insisting that he was starved when she made him stop. Then he demanded to be untied from the couch. His mother gave in on this but sent for Meade to keep him under control and in the bunkroom. She pulled herself forward and found her husband. Hazel and Castor were at the computer; Castor was reading off to her a problem program while she punched the keys; Pollux was taking a doppler reading on Earth. Edith drew Roger Stone away from them and whispered, 'Dear, I guess we can relax. He has eaten - and he didn't get sick.'

'Are you sure? I wouldn't want to take even a slight chance.'

She shrugged. 'How can I be sure? I'm a doctor, not a fortuneteller.'

'What's your decision?'

She frowned, 'I would say to go on to Mars.'

'It's just as well.' He sighed. 'Traffic turned down my alternate flight plan. I was just coming back to tell you.'

'Then we have no choice.'

'You know better than that. I'd rather tell it to the judge than read the burial service. But I have one more card up my sleeve.'

She looked her query; he went on. 'The *War God* is less than ten thousand miles behind us. If necessary, by using our mass margin, in less than a week I could match with her and you and the baby could transfer. She's a "tumbling. pigeon" since they refitted her - anything from Luna-surface to a full gravity.'

'I hadn't thought of that. Well, I don't think it will be necessary but it's a comfort to know that there is help close by.' She frowned. 'I would not like to leave you and the children to shift for yourselves - and besides, it's risky to use your margin; you may need it badly when we approach Mars.'

'Not if we handle the ship properly. Don't you worry; Hazel and I will get it there if we have to get out and push.'

Pollux had stopped what he was doing and had been trying to overhear his parents' conversation. He was unsuccessful; they had had too many years' practice in keeping the kids from hearing. But he could see their intent expressions and the occasional frowns; he signaled his twin.

Castor said, 'Hold it, Hazel. Time out to scratch. What goes, Pol?'

'"Now is the time for all good men".' He nodded toward their parents.

'Right. I'll do the talking.' They moved aft.

Roger Stone looked at them and frowned. 'What is it, boys? We're busy.'

'Yes, sir. But this seems like a salubrious time to make an announcement.'

'Yes?'

'Pol and I vote to go back home.

'Huh?'

'We figure that there's no percentage in taking a chance with Buster.'

Pol added, 'Sure, he's a brat, but look how much you've got invested in him.'

'If he died on us', Castor went on, 'it would spoil all the fun.'

'And even if he didn't, who wants to clean up after him for weeks on end?'

'Right', agreed Pol. 'Nobody likes to play room steward to a sick groundhog.'

'And if he did *die,* the rest of you would blame us for the rest of our lives.'

'Longer than that', Pol added.

'Don't worry about that "negat" from Traffic. Hazel and I are working out a skew path that will let us miss the *Queen Mary* ,with minutes to spare - seconds anyhow. Course it may scare em a little.'

'Quiet!' said Captain Stone. 'One at a time - Castor, let me get this straight: do I understand that you and your brother are sufficiently concerned about your younger brother's welfare that you want to return to Luna in any case?'

'Yes, sir.'

'Even if your mother decides that it is safe for him to continue?'

'Yes, sir. We talked it over. Even if he's looking pretty good now, he was one sick pup and anybody that sick might not make it to Mars. It's a long haul. We don't want to risk it.'

Hazel had come aft and listened; now she said, 'Nobility ill-becomes you, Cas. You were more convincing with the other routine.'

'You butt out of this, Mother. Pol?'

'Cas told you. Shucks, we can make other trips"

Roger Stone looked at his sons. 'I must say', he said slowly, 'that it is surprising and gratifying to find so much family solidarity in this aggregation of individualists. Your mother and I will remember it with pride. But I am glad to say that it is unnecessary. We will continue for Mars.'

Hazel scowled at him. 'Roger, did you bump your head on the takeoff? This is no time to take a chance; we take the kid back to Luna. I've talked with the boys and they mean it. So do I.'

Castor said, 'Dad, if you're afraid of that skew orbit, I'll pilot. I know-'

'Silence!' When he got it he went on as if to himself, 'It says right here in the book to give orders, not explanations, and never to let them be argued. So help me, I'm going to run a taut ship if I have to put my own mother in irons.' He raised his voice. 'All hands! Prepare for maneuvering. Departure for Mars, gravity-well procedure.'

Edith Stone said softly to Hazel, 'The baby is all right. Mother. I'm sure.' Then she turned to her sons. 'Castor, Pollux - come here, dears.'

'But Dad said -'

'I know. Come here first.' She kissed each of them and said, 'Now man your stations.'

Mead appeared at the hatch, towing Lowell behind her like a toy balloon. He seemed cheerful and his face was cheerfully smeared with chocolate. 'What's all the racket about?' she demanded. 'You not only woke us; you must be disturbing people three ships behind.'

VII - IN THE GRAVITY WELL

A gravity-well maneuver involves what appears to be a contradiction in the law of conservation of energy. A ship leaving the Moon or a space station for some distant planet can go faster on less fuel by dropping first toward Earth, then performing her principal acceleration while as close to Earth as possible. To be sure, a ship gains kinetic energy (speed) in falling towards Earth, but one would expect that she would lose exactly the same amount of kinetic energy as she coasted away from Earth.

The trick lies in the fact that the reactive mass or 'fuel' is itself *mass* and as such has potential energy of position when the ship leaves the Moon. The reactive mass used in accelerating near Earth (that is to say, at the bottom of the gravity well) has lost its energy of position by falling down the gravity well. That energy has to go somewhere, and so it does - into the ship, as kinetic energy. The ship ends up going faster for the same force and duration of thrust than she possibly could by departing directly from the Moon or from a space station. The mathematics of this is somewhat baffling - but it works.

Captain Stone put both the boys in the power room for this maneuver and placed Hazel as second pilot. Castor's feelings were hurt but he did not argue, as the last discussion of ship's discipline was still echoing. The pilot has his hands full in this maneuver, leaving it up to the copilot to guard the autopilot, to be ready to fire manually if need he, and to watch for *brennschluss.* It is the pilot's duty to juggle his ship on her gyros and flywheel with his eyes glued to a measuring telescope, a 'coelostat', to be utterly sure to the extreme limit of the accuracy of his instruments that his ship is aimed exactly right when the jet fires.

In the passage from Earth to Mars a mistake in angle of one minute of arc, one sixtieth of a degree, will amount to - at the far end - about fifteen thousand miles. Such mistakes must be paid for in reactive mass by maneuvering to correct, or, if the mistake is large enough, it will he paid for tragically and inexorably with the lives of captain and crew while the ship plunges endlessly on into the empty depths of space.

Roger Stone had a high opinion of the abilities of his twins, but' on this touchy occasion, he wanted the copilot backing him up to have the steadiness of age and experience. With Hazel riding the other. couch he could give his whole mind to his delicate task.

To establish a frame of reference against which to aim his ship he had three stars, Spica, Deneb, and Fomalhaut, lined up in his scope, their images brought together by prisms. Mars was still out of sight beyond the bulging breast of Earth, nor would it have helped to aim for Mars; the road to Mars is a long curve, not a straight line. One of the images seemed to drift a trifle away from the others; sweating, he unclutched his gyros and nudged the ship by flywheel. The errant image crept back into position. 'Doppler?' he demanded.

'In the groove.'

'Time?'

'About a minute. Son, keep your mind on your duck shooting and don't fret.'

He wiped his hands on his shirt and did not answer. For some seconds silence obtained, then Hazel said quietly, 'Unidentified radar beacon blip on the screen, sir. Robot response and a string of numbers.'

'Does it concern us?'

'Closing north and starboard. Possible collision course.'

Roger Stone steeled himself not to look at his own screen; a quick glance would tell him nothing that Hazel had not reported. He kept his face glued to the eyeshade of the coelostat. 'Evasive maneuver indicated?

'Son, you're as likely to dodge into it as duck away from it. Too late to figure a ballistic.'

He forced himself to watch the star images and thought about it. Hazel was right, one did not drive a spaceship by the seat of the pants. At the high speeds and tight curves at the bottom of a gravity well, close up to a planet, an uncalculated maneuver might bring on a collision. Or it might throw them into an untenable orbit, one which would never allow them to reach Mars.

But what could it be? Not a spaceship, it was unmanned. Not a meteor, it carried a beacon. Not a bomb rocket, it was too high. He noted that the images were steady and stole a glance, first at his own screen, which told him nothing, and then through the starboard port.

Good heavens! he could *see* it!

A great gleaming star against the black of space... growing growing!

'Mind your scope, son,' said Hazel. 'Nineteen seconds.'

He put his eye back to the scope; the images were steady. Hazel continued, 'It seems to be drawing ahead slightly.'

He had to look. As he did so something flashed up and obscured the starboard port and at once was visible in the portside port - visible but shrinking rapidly. Stone had a momentary impression of a winged torpedo shape.

'Whew!' Hazel sighed. 'They went that-a-way, podnuh!' She added briskly, 'All hands, brace for acceleration - five seconds!'

He had his eye on the star images, steady and perfectly matched, as the jet slammed him into his pads. The force was four gravities, much more than the boost from Luna, but they held it for only slightly more than one minute. Captain Stone kept watching the star images, ready to check her if she started to swing, but the extreme care with which he had balanced his ship in loading was rewarded: she held her attitude.

He heard Hazel shout, *'Brennschluss!'* just as the noise and pressure dropped off and died. He took a deep breath and said to the mike, 'You all right, Edith?'

'Yes, dear', she answered faintly. 'We're all right.'

'Power room?'

'Okay!' Pollux answered.

'Secure and lock.' There was no need to have the power room stand by, any correction to course and speed on this leg would be made days or weeks later, after much calculation.

'Aye aye, sir. Say, Dad, what was the chatter about a blip?'

'Pipe down', Hazel interrupted. 'I've got a call coming in.' She added, *'Rolling Stone,* Luna, to Traffic - come in, Traffic.'

There was a whir and a click and a female voice chanted:

'Traffic Control to *Rolling Stone,* Luna - routine traffic precautionary: your plan as filed will bring you moderately close to experimental rocket satellite of Harvard Radiation Laboratory. Hold to flight plan; you will fail contact by ample safe margin. End of message; repeat - ' The transcription ran itself through once more and shut off.

'Now they tell us!' Hazel exploded. 'Oh, those cushion warmers! Those bureaucrats! I'll bet that message has been holding in the tank for the past hour waiting for some idiot to finish discussing his missing laundry.'

She went on fuming: '"Moderately close!" "Ample safe margin!" Why, Roger, the consarned thing singed my eyebrows!'

'"A miss is as good as a mile".'

'A mile isn't nearly enough, as you know darn well. It took ten years off my life - and at my age I can't afford that.'

Roger Stone shrugged. After the strain and excitement he was feeling let down and terribly weary; since blastoff he had been running on stimulants instead of sleep. 'I'm going to cork off for the next twelve hours. Get a preliminary check on our, vector; if there's nothing seriously wrong, don't wake me. I'll look at it when I turn out.'

'Aye aye, Captain Bligh.'

First check showed nothing wrong with their orbit: Hazel followed him to bed - 'bed' in a figurative sense, for Hazel never strapped herself to her bunk in free fall, preferring to float loosely wherever air currents wafted her. She shared a stateroom with Meade. The three boys were assigned to the bunkroom and the twins attempted to turn in - but Lowell was not sleepy. He felt fine and was investigating the wonderful possibilities of free fall. He wanted to play tag. The twins did not want to play tag; Lowell played tag anyhow,.

Pollux snagged him by an ankle. 'Listen, you! Weren't you enough trouble by being sick?'

'I was not sick!'

'So? Who was it we had to clean up after? Santa Claus?'

'There ain't any Santa Claus. I was not sick. You're a fibber, you're a fibber, you're a fibber!'

'Don't argue with him,' Castor advised. 'Just choke him and stuff him out the lock. We can explain and correct the ship's mass factor tomorrow.'

'I was not sick!'

Pollux said, 'Meade had quite a bit of sack time on the leg down. Maybe you can talk her into taking him off our hands?'

'I'll try'.'

Meade was awake; she considered it. 'Cash?'

'Sis, don't be that way!'

'Well ... three days' dishwashing?'

'Skinflint! It's a deal; come take charge of the body.' Meade had to use the bunkroom as a nursery; the boys went forward and slept in the control room, each strapping himself loosely to a control couch as required by ship's regulations to avoid the chance of jostling instruments during sleep.

VIII - THE MIGHTY BOOM

Captain Stone had all hands with the exception of Dr Stone and Lowell compute their new orbit. They all worked from the same. data, using readings supplied by Traffic Control and checked against their own instruments. Roger Stone waited until all had finished before comparing results.

'What do you get, Hazel?'

'As I figure, Captain, you won't miss Mars by more than a million miles or so.'

'I figure it right on.'

'Well, now that you mention it, so do I.'

'Cas? Pol? Meade?'

The twins were right together to six decimal places and checked with their father and grandmother to five, but Meade's answer bore no resemblance to any of the others. Her father looked it over curiously. 'Baby girl, I can't figure out how you got this out of the computer. As near as I can tell you have us headed for Proxima Centauri.'

Meade looked at it with interest. 'Is that so? Tell you what let's use mine and see what happens. It ought to be interesting.'

'But not practical. You have us going faster than light.'

'I *thought* the figures were a bit large.'

Hazel stuck out a bony forefinger. 'That ought to be a minus sign, hon.'

'That's not all that's wrong', announced Ppllux. 'Look at this - ' He held out Meade's programming sheet.

'That will do, Pol', his father interrupted. 'You are not called on to criticise Meade's astrogation.'

'But -'

'Stow it.'

'I don't mind, Daddy,' Meade put in. 'I knew I was wrong.' She shrugged. 'It's the first one I've ever worked outside of school. Somehow it makes a difference when it's real.'

'It certainly does as every astrogator learns. Never mind' Hazel has the median figures. We'll log hers.'

Hazel shook hands with herself. 'The winnah and still champeen!'

Castor said, 'Dad, that's final? No more maneuvers until you calculate your approach to Mars?'

'Of course not. No changes for six months at least. Why?'

'Then Pol and I respectfully request the Captain's permission to decompress the hold and go outside. We want to get to work on our bikes.'

'Never mind the fake military-vessel phraseology. But I have news for you.' He took a sheet of paper out of his belt pouch. 'Just a moment while I make a couple of changes.' He wrote on it, then fastened it to the control room bulletin board. It read:

SHIP'S ROUTINE
0700 Reveille (optional for Edith, Hazel, & Buster)
0745 Breakfast (Meade cooks. Twins wash dishes)
0900 School C & P, math
Meade, astrogation, coached by Hazel
Lowell, reeling, writhing, and fainting in coils - or whatever his mother deems necessary
1200 End of morning session
1215 Lunch
1300 SchoolC&P,math
Hydroponics chores, Meade
1600 End of afternoon session
1800 Dinner - All Hands initial ship's maintenance schedule.

SATURDAY ROUTINE - turn to after breakfast and clean ship, Hazel in charge. Captain's inspection at 1100. Personal laundry in afternoon.

SUNDAY ROUTINE - meditation, study, and recreation. Make & Mend in afternoon.

Hazel looked it over. 'Where are we headed, Rog? Botany Bay? You forgot to set a time to flog the peasants.'

'It seems very reasonable to me.'

'Possibly. Six gets you ten it won't last a week.'

'Done. Let's see your money.'

The twins had read it with dismay. Pollux blurted out, 'But Dad! You haven't left us any time to repair our bikes - do you want us to lose our investment?'

'I've assigned thirty hours of study a week. That leaves one hundred and thirty-eight other hours. How you use them is your business as long as you keep our agreement about studying.'

Castor said, 'Suppose we want to start math at eight-thirty and again right after lunch? Can we get out of school that much earlier?'

'I see no objection.'

'And suppose we study evenings sometimes? Can we work up some velvet?'

Their father shrugged. 'Thirty hours a week - any reasonable variations in the routine will be okay, provided you enter in the log the exact times.'

'Now that that's settled', Hazel commenced, 'I regret to inform you, Captain, that there is one other little item on that Procrustean program that will have to be canceled for the time being at least. Much as I would enjoy inducing our little blossom into the mysteries of astrogation I don't have the time right now. You'll have to teach her yourself.'

'Why?'

'"Why" the man asks? You should know better than anyone. *The Scourge of the Spaceways,* that's why. I've got to hole up and write like mad for the next three or four weeks; I've got to get several months of episodes ahead before we get out of radio range.'

Roger Stone looked at his mother sadly. 'I knew it was bound to come, Hazel, but I didn't expect it to hit you so young. The mental processes dull, the mind tends to wander, the -'

'Whose mind does what? Why you young -'

'Take it easy. If you'll look over your left shoulder out the starboard port and squint your eyes, you might imagine that you see a glint on the *War* God. It can't be much over ten thousand miles away.'

'What's that got to do with me?' she demanded suspiciously.

'Poor Hazel! We'll take good care of you, Mother, we're riding in orbit with several large commercial vessels; every one of them has burners powerful enough to punch through to Earth. We won't *ever* be out of radio contact with Earth.'

Hazel stared out the port as if she could actually spot the *War God.* 'Well, I'll be dogged', she breathed. 'Roger, lead me to my room - that's a good boy. It's senile decay, all right You'd better take back your show; I doubt if I can write it.'

'Huh, uh! You let them pick up that option; you've *got* to write it. Speaking of *The Scum* of *the Waste Spaces,* I've been meaning to ask you a couple of questions about it and this is the first spare moment we've had. In the first place, why did you let them sign us up again?'

'Because they waved too much money under my nose, as you know full well. It's an aroma we Stones have hardly ever been able to resist.'

'I just wanted to make you admit it. You were going to get me off the hook - remember? So you swallowed it yourself.'

'More bait.'

'Surely. Now the other point: I don't see how you dared to go ahead with it, no matter how much money they offered. The last episode you showed me, while you had killed off the Galactic

Overlord you had also left Our Hero in a decidedly untenable position. Sealed in a radioactive sphere, if I remember correctly, at the bottom of an ammonia ocean on Jupiter. The ocean was swarming with methane monsters, whatever they are, each hypnotised by the Overlord's mind ray to go after John Sterling at the frst whiff - and him armed only with his Scout knife. How did you get him out of it?'

'We found a way', put in Pol. 'If you assume -'

'Quiet infants. Nothing to it, Roger. By dint of superhuman effort Our Hero extricated himself from his predicament and-'

'That's no answer.'

'You don't understand. I open the next episode on Ganymede. John Sterling is telling Special Agent Dolores O'Shanahan about his adventure. He's making light of it, see? He's noble so he really wouldn't want to boast to a girl. Just as he is jokingly disparaging his masterly escape the next action starts and it's so fast and so violent and so bloody that our unseen audience doesn't have time to think about it until the commercial. And by then they've got too much else to think about.'

Roger shook his head. 'That's literary cheating.'

'Who said this was literature? It's a way to help corporations take tax deductions. I've got three new sponsors.'

'Hazel', asked Pollux, 'where have you got them now? What's the situation?'

Hazel glanced at the chronometer. 'Roger, does that schedule take effect today? Or can we start fresh tomorrow?'

He smiled feebly. 'Tomorrow, I guess.'

'If this is going to degenerate into a story conference, I'd better get Lowell. I get my best ideas from Lowell; he's just the mental age of my average audience.'

'If I were Buster, I would resent that.'

'Quiet!' She slithered to the hatch and called out' 'Edith! May I borrow your wild animal for a while?'

Meade said, 'I'll get him, Grandmother. But wait for me.'

She returned quickly with the child. Lowell said, 'What do you want, Grandma Hazel? Bounce tag?'

She gathered him in an arm. 'No, son - blood. Blood and gore. We're going to kill off some villains.'

'Swell!

'Now as I recall it - and mind you, I was only there once - I left them lost in the Dark Nebula. Their food is gone and so is the Q-fuel. They've made a temporary truce with their Arcturian prisoners and set them free to help - which is safe enough because they are silicon-chemistry people and can't eat humans. Which is about what they are down to; the real question is - who gets barbecued for lunch? They need the help of the Arcturian prisoners because the Space Entity they captured in the last episode and imprisoned in an empty fuel tank has eaten its way through all but the last bulkhead and *it* doesn't have any silly previous prejudices about body chemistry. Carbon or silicon; it's all one to it.'

'I don't believe that's logical,' commented Roger stone. 'If its own chemistry was based-'

'Out of order,' ruled Hazel. 'Helpful suggestions only, please. Pol? You seem to have a gleam in your eye'

'This, Space Entity jigger can he stand up against radar wave lengths?'

'Now we're getting somewhere. But we've got to complicate it a bit Well, Meade?'

The twins started moving their bicycles outside the following day. The suits they wore were the same ones they had worn outdoors on the Moon, With the addition of magnetic boots and small rocket motors. These latter were strapped to their backs with the nozzles sticking straight out from their waists. An added pressure bottle to supply the personal rocket motor was mounted on the shoulders of each boy but, being weightless, the additional mass was little handicap.

'Now remember,' their father warned them, 'those boost units are strictly for dire emergency. Lifelines at all times. And don't depend on your boots when you shift lines, snap on the second line before you loose the first.'

'Shucks, Dad, we'll be careful.'

'No doubt. But you can expect me to make a surprise inspection at any time. Oue slip on a safety precaution and it's the rack and thumb screws, plus fifty strokes of bastinado.'

'No boiling oil?'

'Can't afford it. See here, you think I'm joking. If one of you should happen to get loose and drift away from the ship, don't expect me to come after you. One of you is a spare anyway.'

'Which one?' asked Pollux. 'Cas, maybe?'

'Sometimes I think it's one, sometimes the other. Strict compliance with ship's orders will keep me from having to decide at this time.'

The cargo hatch had no airlock; the twins decompressed the entire hold, then opened the door, remembering just in time to snap on their lines as the door opened. They looked out and both hesitated. Despite their lifelong experience with vacuum suits on the face of the Moon this was the first time either one had ever been outside a ship in orbit.

The hatch framed endless cosmic night, blackness made colder and darker by the unwinking diamond stars many lightyears away. They were on the night side of the *Stone*; there was nothing but stars and the swallowing depths. It was one thing to see it from the safety of Luna or through the strong quartz of a port; it was quite another to see it with nothing at all between one's frail body and the giddy, cold depths of eternity.

Pollux said, 'Cas, I don't like this.'

'There's nothing to be afraid of.'

'Then why are my teeth chattering?'

'Go ahead; I'll keep a tension on your line.'

'You are too good to me, dear brother - a darn sight too good! You go and I'll keep a tension on *your* line.'

'Don't be silly! Get on out there.'

'After you, Grandpa.'

'Oh, well!' Castor grasped the frame of the hatch and swung himself out. He scrambled to click his magnetic boots to the side of the ship but the position was most awkward, the suit was cumbersome, and he had no. gravity to help him. Instead, he swung around and his momentum pulled his fingers loose from the smooth frame. His floundering motions bumped the side of the ship and pushed him gently away. He floated out, still floundering, until his line checked him three or four feet from the side. 'Pull me in!'

'Put your feet down, clumsy!'

'I can't. Pull me in, you redheaded moron!'

'Don't call me "redheaded".' Pollux let out a couple of feet more line.

'Pol, quit fooling. I don't like this.'

'I thought you were brave. Grandpa?'

Castor's reply was incoherent. Pollux decided that it had gone far enough; he pulled Castor in and, while holding firmly to a hatch dog himself, he grabbed one of Castor's boots and set it firmly against the side; it clicked into place. 'Snap on your other line,' he ordered.

Castor, still breathing heavily, looked for a padeye in the side of the ship. He found one nearby and walked over to it, picking up his feet as if he walked in sticky mud. He snapped his second line to the ring of the padeye and straightened up. 'Catch,' Pollux called out and sent his own second line snaking out to his twin

Castor caught it and fastened it beside his own. 'All set?' asked Pollux. 'I'm going to unsnap us in here.'

'All secure.' Castor moved closer to the hatch.

'Here I come.'

'So you do.' Castor gave Pollux's line a tug; Pollux came sailing out of the hatch - and Castor let him keep on sailing. Castor checked the line gently through his fingers, soaking up the momentum, so that Pollux reached the end of the fifty-foot line and stayed there without bouncing back.

Pollux had been quite busy on the way out but to no effect -sawing vacuum is futile. When he felt himself snubbed to a stop he quit straggling. 'Pull me back!'

'Say "uncle".'

Pollux said several other things, some of which he had picked up dockside on Luna, plus some more colorful expressions derived from his grandmother. 'You had better get off this ship,' he concluded, 'because I'm coming down this line and take your helmet off.' He made a swipe for the line with one hand; Castor flipped it away.

'Say "even-Steven" then.'

Pollux had the line now, having remembered to reach for his belt where it was hooked instead of grabbing for the bight.' Suddenly he grinned. 'Okay - "even-Steven".'

'Even-Steven it is. Hold still; I'll bring you in.' He towed him in gently, grabbing Pol's feet and clicking them down as he approached. 'You looked mighty silly out there,' he commented when Pollux was firm to the ship's side.

His twin invoked their ritual. 'Even-Steven!'

'My apologies, Junior. Let's get to work.'

Padeyes were spaced about twenty feet apart all over the skin of the ship. They had been intended for convenience in rigging during overhauls and to facilitate outside inspections while underway; the twins now used them to park bicycles. They removed the bicycles from the hold half a dozen at a time, strung on a wire loop like a catch of fish. They fastened each clutch of bikes to a padeye; the machines floated loosely out from the side like boats tied up to an ocean ship.

Stringing the clusters of bicycles shortly took them over the 'horizon' to the day side of the ship. Pollux was in front carrying six bicycles in his left hand. He stopped suddenly. 'Hey, Grandpa! Get a load of this!'

'Don't look at the Sun,' Castor said sharply.

'Don't be silly. But come see this.'

Earth and Moon swam in the middle distance in slender crescent phase. The *Stone* was slowly dropping behind Earth in her orbit, even more slowly drifting outward away from the Sun. For many weeks yet Earth would appear as a ball, a disc, before distance cut her down to a brilliant star. Now she appeared about as large as she had from Luna but she was attended by Luna herself. Her day side was green and dun and lavished with cottony clouds; her night side showed the jewels of cities.

But the boys were paying no attention to the Earth; they were looking at the Moon. Pollux sighed. 'Isn't she beautiful?'

'What's the matter, Junior? Homesick?'

'No. But she's beautiful, just the same. Look, Cas, whatever ships we ever own, let's always register them out of Luna City. Home base.'

'Suits. Can you make out the burg?'

'I think so.'

'Probably just a spot on your helmet. I can't. Let's get back to work.'

They had used all the padeyes conveniently close to the hatch and were working aft when Pollux said, 'Wups I Take it easy. Dad said not to go aft of frame 65.'

'Shucks, it must be "cool" back to 90, at least. We've used the jet less than five minutes.'

'Don't be too sure; neutrons are slippery customers. And you know what a stickler Dad is, anyway.'

'He certainly is,' said a third voice.

They did not jump out of their boots because they were zipped tight. Instead they turned around and saw their father standing, hands on hips, near the passenger airlock. Pollux gulped and said, 'Howdy, Dad.'

'You sure gave us a start' Castor added sheepishly.

'Sorry. But don't let me disturb you; I just came out to enjoy the view.' He looked over their work. 'You've certainly got my ship looking like a junkyard.'

'Well, we had to have room to work. Anyhow, who's to see?'

'In this location you have the Almighty staring down the back of your neck. But I don't suppose He'll mind.'

'Say, Dad, Pol and I sort of guessed that you wouldn't want us to do any welding inside the hold?'

'You sort of guessed correctly - not after what happened in the *Kong Christian.'*

'So we figured we could jury-rig a rack for welding out here. Okay?'

'Okay. But it's too nice a day to talk business.' He raised his open hands to the stars and looked out. 'Swell place. Lots of elbow room. Good scenery.'

'That's the truth; But come around to the Sun side if you want to see something.'

'Right. Here, help me shift my lines.' They walked around the hull and into the sunlight. Captain Stone, Earth born, looked first at the mother planet. 'Looks like a big storm is working up around the Philippines.'

Neither of the twins answered; weather was largely a mystery to them, nor did they approve of weather. Presently he turned to them and said softly, 'I'm glad we came, boys. Are you?'

'Oh, you bet!' 'Sure!' They had forgotten how cold and unfriendly the black depths around them had seemed only a short time before. Now it was an enormous room, furnished in splendor, though not yet fully inhabited. It was their own room, to live in, to do with as they liked.

They stood there for quite a long time, enjoying it At last Captain Stone said, 'I've had all the sun I can stand for a while. Let's work around back into the shade.' He shook his head to dislodge a drop of sweat from his nose.

'We ought to get back to work anyhow.'

'I'll help you; we'll get done faster.'

The *Rolling Stone* swung on and outward toward Mars; her crew fell into routine habits. Dr Stone was handy at weightless cooking, unusually skillful, in fact, from techniques she had picked up during a year's internship in the free-fall research clinic in Earth's station. Meade was not so skilled but very little can be done to ruin breakfast. Her father supervised her hydroponics duties, supplementing thereby the course she had had in Luna City High School. Dr Stone split the care of her least child with his grandmother and used her leisure placidly collating some years of notes for a paper 'On the Cumulative Effects of Marginal Hypoxia.'

The twins discovered that mathematics could be even more interesting than they had thought and much more difficult - it required even more 'savvy' than they thought they had (already a generous estimate) and they were forced to stretch their brains. Their father caught up on the back issues of *The Reactomotive World* and studied his ship's manual but still had plenty of time to coach them and quiz them. Pollux, he discovered, was deficient in the ability to visualise a curve on glancing at ,an equation.

'I don't understand it,' he said. 'You got good marks in analytical geometry.'

Pollux turned red. 'What's biting you?' his father demanded.

'Well, Dad, you see it's this way -'

'Go on.'

'Well, I didn't *exactly* get good marks in analyt.'

Eh? What is this? You both got top marks; I remember clearly.'

'Well, now, you see - Well, we were awfully busy that semester and, well, it seemed logical. . . ' His voice trailed off.

'Out with it! Out with it!'

'Cas took both courses in analyt.' Pollux blurted out, 'and I took both courses in history. But I did read the book.'

'Oh, my!' Roger Stone sighed. 'I suppose it's covered by the statute of limitations by this time. Anyhow, you are finding out the hard way that such offences carry their own punishments. When you need it, you don't know it worth a hoot.'

'Yessir.'

'But an extra hour a day for you, just the same - until you can visualise instantly from the equation a four-cooordinate hypersurface in a non-Euclidean continuum - standing on your head in a cold shower.'

'Yessir.'

'Cas, what course did you fudge? Did you read the book?'

'Yes, sir. It was medieval European history, sir.'

'Hmm . . . You're equally culpable, but I'm not too much concerned with any course that does not require a slide rule and tables. You coach your brother.'

'Aye aye, sir.'

'If you are pinched for time, I'll give you a hand with those broken-down bicycles, though I shouldn't.'

The twins pitched into it, hard. At the end of two weeks Roger Stone announced himself satisfied with Pollux's proficiency in analytical geometry. They moved on to more rarefied heights . . . the complex logics of matrix algebra, frozen in beautiful arrays. . . the tensor calculus that unlocks the atom. . . the wild and wonderful field equations that make Man king of the universe . . . the crashing, mind-splitting intuition of Forsyte's Solution that had opened the 21st century and sent mankind another mighty step toward the stars. By the time Mars shone larger in the sky than Earth they had gone beyond the point where their father could reach them; they ploughed on together.

They usually studied together, out of the same book, floating head to head in their bunkroom, one set of feet pointed to celestial south, the other pair to the north. The twins had early gotten into the habit of reading the same book at the same time; as a result either of them could read upside down as easily as in the conventional attitude. While so engaged Pollux said to his brother, 'You know, Grandpa, some of this stuff makes me think we ought to go into research rather than business. After all, money isn't everything.'

'No,' agreed Castor, 'there are also stocks, bonds, and patent rights, not to mention real estate and chattels.'

'I'm serious.

'We'll do both. I've finished this page; flip the switch when you're ready.'

The *War* God, riding in a slightly different orbit, had been gradually closing on them until she could be seen as a 'star' by naked eye - a variable star that winked out and flared up every sixteen seconds. Through the *Stone's* coelostat the cause could easily be seen; the *War God* was tumbling end over end, performing one full revolution every thirty-two seconds to provide centrifugal 'artificial gravity' to coddle the tender stomachs of her groundhog passengers. Each half revolution the Sun's rays struck her polished skin at the proper angle to flash a dazzling gleam at the *Stone.* Through the 'scope the reflection was bright enough to hurt the eyes.

The observation turned out to be both ways. A radio message came in; Hazel printed it and handed it with a straight face to her son: 'WAR GOD TO ROLLING STONE - PVT - ROG OLD BOY, I HAVE YOU IN THE SCOPE. WHAT IN SPACE HAVE YOU GOT ON YOU? FUNGUS? OR SEA WEEDS? YOU LOOK LIKE A CHRISI'MAS TREE. P. VANDENBERGH, MASTER.'

Captain Stone glared at the message stat. 'Why, that fat Dutchman'! I'll "fungus" him. Here, Mother, send this: "Master to Master - private message: In that drunken tumbling pigeon how do you keep your eye to a scope? Do you enjoy playing nursemaid to a litter of groundhogs? No doubt the dowagers fight over a chance to eat at the captain's table. Fun, I'll bet. R. Stone, Master".'

The answer came back: 'ROGER DODGER YOU OLD CODGER, I'VE LIMITED MY TABLE TO FEMALE PASSENGERS CIRCA AGE TWENTY SO I CAN KEEP AN EYE ON THEM - PREFERENCE GIVEN TO BLONDES AROUND FIFTY KILOS MASS. COME OVER FOR DINNER. VAN.'

Pollux looked out the port, caught the glint on the *War God.* 'Why don't you take him up, Dad? I'll bet I could make it across on my suit jet with one spare oxy bottle.'

'Don't be silly. We haven't that much safety line, even at closest approach. Hazel, tell him: "Thanks a million but I've got the prettiest little girl in the system cooking for me right now."'

Meade said, 'Me, Daddy? I thought you didn't like my cooking?'

'Don't give yourself airs, snub nose. I mean your mother, of course.'

Meade considered this. 'But I look like her, don't I?'

'Some. Send it, Hazel.'

'RIGHT YOU ARE! MY RESPECTS TO EDITH. 'TRUTHFULLY, WHAT IS THAT STUFF? SHALL I SEND OVER WEEDKILLER, OR BARNACLE REMOVER? OR COULD WE BEAT IT TO DEATH WITH A STICK?'

'Why not tell him, Dad?' Castor inquired

'Very well, I will, send: "Bicycles: want to buy one?"'

To their surprise Captain Vandenbergh answered:

'MAYBE. GOT A RALEIGH "SANDMAN"?'

'Tell him, "Yes!" 'Pollux put in. 'A-number-one condition and brand-new tires. A bargain.'

'Slow up there,' his father interrupted. 'I've seen your load. If you've got a bike in first-class condition, Raleigh or any other make, you've got it well hidden.'

'Aw, Dad, it will be - by the time we deliver.'

'What do you suppose he wants a bicycle for, dear?' Dr Stone asked. 'Prospecting? Surely not.'

'Probably just sightseeing. All right, Hazel, you can send it - but mind you, boys, I'll inspect that vehicle-myself; Van trusts me.'

Hazel pushed herself away from the rig. 'Let the boys tell their own whoppers. I'm getting bored with this chitchat.'

Castor took over at the key, started to dicker. The passenger skipper, it developed, really was willing to buy a bicycle. After a leisurely while they settled on a price well under Castor's asking price, attractively under the usual prices on Mars, but profitably over what the boys had paid on Luna - this for delivery F.O.B. Phobos, circum Mars.

Roger Stone exchanged affectionate insults and gossip with his friend from time to time over the next several days. During the following week the *War God* came within phone range, but the conversations dropped off and stopped; they had exhausted topics of conversation. The *War God* had made her closest approach and was pulling away again; they did not hear from her for more than three weeks.

The call was taken by Meade. She hurried aft to the hold where her father was helping the twins spray enamel on reconditioned bicycles. 'Daddy, you're wanted on the phone? *War God,* master to master - official.'

'Coming.' He hurried forward and took the call. *'Rolling Stone,* Captain Stone speaking.'

'War God, commanding officer speaking. Captain, can you -

'Just a moment. This does not sound like Captain Vandenbergh.'

'It isn't. This is Rowley, Second Officer. I -'

'I understand that your captain wanted me, officially. Let me speak with him.'

'I'm trying to explain, Captain.' The officer sounded strained and irritable. 'I *am* the commanding officer. Both Captain Vandenbergh and Mr O'Flynn are on the binnacle list.'

'Eh? Sorry. Nothing serious, I hope?'

'I'm afraid it is, sir. Thirty-seven cases on the sick list this morning - and four deaths.'

'Great Scott, man! What is it?'

'I don't know, sir.'

'Well, what does your medical officer *say* it is?'

'That's it, sir. The Surgeon died during the midwatch.'

'Oh-'

'Captain, can you possibly match with us? Do you have enough maneuvering margin?'

'What? Why?'

'You have a medical officer aboard. Haven't you?'

'Huh? But she's my wife!' -

'She's an M.D., is she not?'

Roger Stone remained silent for a long moment. Then he said, 'I'll call you back shortly, sir.'

It was a top level conference, limited to Captain Stone, Dr Stone, and Hazel. First, Dr Stone insisted on calling the *War God* and getting a full report on symptoms and progress of the disease. When she switched off her husband said, 'Well, Edith, what is it?'

'I don't know. I'll have to see it.'

'Now, see here, I'm not going to have you risking -'

'I'm a doctor, Roger.'

'You're not in practice, not now. And you are the mother of a family. It's quite out of the ques -'

'I am a doctor, Roger.'

He sighed heavily. 'Yes, dear.'

'The only thing to be determined is whether or not you can match in with the *War God.* Have you two reached an answer?'

'We'll start computing.'

'I'm going aft and check over my supplies.' She frowned. '1 didn't expect to have to cope with an epidemic.'

When she was gone Roger turned his face, twisted with indecision, to Hazel. 'What do you think, Mother?'

'Son, you don't stand a chance. She takes her oath seriously. You've known that a long time.'

'I haven't taken the Hippocratic oath! If I won't move the ship, there's nothing she can do about it.'

'You're not a doctor, true. But you're a master in space. I guess the "succour & rescue" rule might apply.'

'The devil with rules! This is *Edith.'*

'Well,' Hazel said slowly, 'I guess I might stack the Stone family up against the welfare of the entire human race in a pinch, myself. But I can't decide it for you.'

'I won't let her do it! It's not me. There's Buster - he's no more than a baby still; he needs his mother.'

'Yes, he does.'

'That settles it. I'm going aft and tell her.'

'Wait a minute! If that's your decision, Captain, you won't mind me saying that's the wrong way to do it.'

'Eh?'

'The only way you'll get it past your wife is to get on that computer and come out with the answer you're looking for. . . an answer that says it's physically impossible for us to match with them and still reach Mars.'

'Oh. You're right. Look, will you help me fake it?'

'I suppose so.'

'Then let's get busy.'

'As you say, sir. You know, Roger, if the *War God* comes in with an unidentified and uncontrolled disease aboard, they'll never let her make port at Mars. They'll swing her in a parking orbit, fuel her up again, and send her back at next optimum.'

'What of it? It's nothing to me if fat tourists and a bunch of immigrants are disappointed.'

'Check. But I was thinking of something else. With Van and the first officer sick, maybe about to check in, if the second officer comes down with it, too, the *War God* might not even get as far as a parking orbit.'

Roger Stone did not have to have the thought elaborated; a ship approaching a planet, unless manoeuvred at the last by a skilled pilot, can do one of only two things - crash, or swing on past and out endlessly into empty space to take up a comet-like orbit which arrives nowhere ever.

He covered his face with his hands. 'What do I do, Mother?'

'You are captain, son.'

He sighed. 'I suppose I knew it all along.'

'Yes, but you had to struggle with it first.' She kissed him. 'Orders, son?'

'Let's get to it. It's a good thing we didn't waste any margin in departure.'

'That it is.'

When Hazel told the others the news Castor asked, 'Does Dad want us to compute a ballistic?'

'No.'

'A good thing - for we've got to get those bikes inboard, fast! Come on, Pol. Meade, how about suiting up and giving us a hand? Unless Mother needs you?'

'She does,' answered Hazel, 'to take care of Lowell and keep him out of the way. But you won't be bringing the bikes inboard.'

'What? You can't balance the ship for maneuvers with them where they are. Besides, the first blast would probably snap the wires and change your mass factor.'

'Cas, where are your brains? Can't you see the situation? We jettison.'

'Huh? We throw away our *bikes?* After dragging almost to Mars?'

'Your bikes, all our books, and everything else we can do without. The rough run-through on the computer made that clear as quartz; it's the only way we can do this maneuver and still be sure of having a safe margin for homing in. Your father is checking over the weight schedule right now.'

'But -, Castor's face suddenly relaxed and became impassive. 'Aye aye, ma'am.'

The twins were suiting up but had not yet gone outside when Pollux was struck by a notion. 'Cas? We cut the bikes loose; then what happens?'

'We charge it off to experience - and try to recover from Four-Planets Transit. They won't pay up, of course.'

'Use your skull. Where do the bikes end up?'

'Huh? Why, at *Mars!'*

'Right. Or pretty near. In the orbit we're in now, they swing in mighty close and then head down Sunside again. Suppose, on closest approach, we are standing there waiting to snag 'em?'

'Not a chance. It will take us just as long to get to Mars - and in a different orbit, same as the *War God's?*

'Yes, but just supposing. You know, I wish I had a spare radar beacon to hang on them. Then if we could reach them, we'd know where they were.'

'Well, we haven't got one. Say! Where did you put that used reflecting foil?'

'Huh? Oh, I see. Grandpa, sometimes your senile decay is not quite so noticeable.' The *Stone* had started out, of course, covered on one side of her living quarters by mirror-bright aluminium foil. As she drifted farther and farther from the Sun, reflecting the Sun's heat had grown less necessary, absorbing it more desirable. To reduce the load on the ship's heating and cooling system, square yards of it were peeled up and taken inside to store from week to week.

'Let's ask Dad.'

Hazel stopped them at the hatch to the control room. 'He's at the computer. What's the complaint?'

'Hazel, the reflecting foil we've been salvaging - is it on the jettison list?'

'Certainly. We'll pick up some more on Mars for the trip back. Why?'

'A radar corner - that's why!' They explained the plan. She nodded. 'A long chance, but it makes sense. See here, wire everything we jettison to the bikes. We might get it all back.'

'Sure thing!' The twins got busy. While Pollux gathered together the bunches of bicycles, all but a few in good repair and brave with new paint. Castor constructed a curious geometrical toy. With 8-gauge wire, aluminium foil, and sticky tape he made a giant square of foil, edged and held flat with wire. This he bisected at right angles with a second square. The two squares he again bisected at the remaining possible right angle with a third square. The result was eight shiny right-angled corners facing among them in all possible directions - a radar reflector. Each corner would bounce radar waves directly back to source, a principle easily illustrated with a rubber ball and any room or box corner. The final result was to step up the effectiveness or radar from an inverse fourth-power law to an inverse square law - in theory, at least. In practice it would be somewhat less than perfectly efficient but the radar response of the assembly would be increased enormously. A mass so tagged would stand out on a radar screen like a candle in a cave.

This flimsy giant kite Castor anchored to the ball of bicycles and other jetsam with an odd bit of string. No stronger link was necessary; out here no vagrant wind would blow it away, no one would cut it loose. 'Pol', he said, 'go bang on the port and tell 'em we're ready.'

Pollux walked forward and did so, rapping on the quartz first to attract his grandmother's attention, then tapping code to report. While he was gone Castor attached a piece of paper reading:

NOT FOR SALVAGE

This cargo is in free transit by intention. The undersigned owner intends to recover it and warns all parties not to claim it as abandoned. U.P. Rev. Stat. # 193401

Roger Stone, Master

P.Y. *Rolling Stone,* Luna

When Pollux came back he said, 'Hazel says go ahead but take it easy.'

'Of course.' Castor untwisted the single wire that held the ungainly mass to the ship, then stood back and watched it. It did not move. He reached out and gave it the gentlest shove with his little finger, then continued watching. Slowly, slowly it separated from the ship. He wished to disturb its orbit as little as possible, to make it easy to find. The petty vector he had placed on it - an inch a minute was his guess - would act for all the days from there to Mars; he wanted the final sum to remain small.

Pollux twisted around and picked out the winking gleam of the *War God.* 'Will the jet be clear of it when we swing ship?' he asked anxiously.

'Quit worrying. I already figured that.'

The maneuver to he performed was of the simplest - point to point in space in a region which could be treated as free of gravity strain since the two ships were practically the same distance from the Sun and Mars was too far away to matter. There were four simple steps: cancellation of the slight vector difference between the two ships (the relative speed with which the *War* God was puffing away), acceleration toward the *War* God, transit of the space between them, deceleration to match orbits and lie dead in space relative to each other on arrival.

Steps one and two would be combined by vector addition; step three was simply waiting time. The operation would be two maneuvers, two blasts on the jet.

But step three, the time it would take to reach the *War God,* could be enormously cut down by lavish use of reactive mass. Had time been no object they could have, as Hazel put it, closed the gap 'by throwing rocks off the stern.' There was an infinite number of choices, each requiring different amounts of reactive mass. One choice would have saved the bicycles and their personal possessions - but it would have stretched the transit time out to over two weeks.

This was a doctor's emergency call - Roger Stone elected to jettison.

But he did not tell the twins this and he did not require them to work a ballistic. He did not care to let them know of the choice between sacrificing their capital or letting strangers wait for medical attention. After all, he reflected, the twins were pretty young.

Eleven hours from blast time the *Stone* hung in space close by the *War God.* The ships were still plunging toward Mars at some sixteen miles per second; relative to each other they were stationary - except that the liner continued her stately rotation, end over end. Dr Stone, her small figure encumbered not only with space suit, pressure bottles, radio, suit jet, and life lines, but also with a Santa Claus pack of surgical supplies, stood with her husband on the side of the *Stone* nearest the liner. Not knowing exactly what she might need she had taken all that she believed could be spared from the stock of their own craft -drugs, antibiotics, instruments, supplies.

The others had been kissed good-by inside and told to stay there. Lowell had cried and tried to keep his mother from entering the lock. He had not been told what was going on, but the emotions of the others were contagious.

Roger Stone was saying anxiously, 'Now see here, the minute you have this under control, back you come - you hear?'

She shook her head. 'I'll see you on Mars, dearest.'

'No indeed! You -'

'No, Roger. I might act as a carrier. We can't risk it.'

'You might act as a carrier corning back to us on Mars, too. Don't you *ever* expect to come back?'

She ignored the rhetorical question. 'On Mars there will be hospitals. But I can't risk a family epidemic in space.'

'Edith I've a good mind to refuse to-'

'They're ready for me, dear. See?'

Over their heads, two hundred yards away, a passenger lock on the rotation axis of the mighty ship had opened; two small figures spilled silently out, flipped neatly to boot contact, stood on the ship's side, their heads pointing 'down' at Mr and Mrs Stone. Roger Stone called into his microphone, *'War God!'*

'WarGod aye aye!'

'Are you ready?'

'Whenever you are.'

'Stand by for transfer.'

Acting Captain Rowley had proposed sending a man over to conduct Dr Stone across the gap. She had refused, not wishing to have anyone from the infected ship in contact with the *Rolling Stone.* Now she said, 'Are my lines free for running, Roger?'

'Yes, dearest.' He had bent several lines together, one end to her waist, the other to a padeye.

'Will you do my boots, dear?'

He kneeled and unzipped her magnetic boots without speaking, his voice having become uncertain. He straightened and she put her arms around him. They embraced awkwardly, hampered by the suits, hampered by the extra back pack she carried. 'Adios, my darling,' she said softly. 'Take care of the children.'

'Edith! Take care of yourself!'

'Yes, dear. Steady me now.'

He slipped his hands to her hips; she stepped out of the boots, was now held against the ship only by his hands.

'Ready! One! Two!' They crouched down together. 'Three!' She jumped straight away from the ship, her lines snaking after her. For long, long seconds she sailed straight out over his head, closing the gap between her and the liner. Presently it became evident that she had not leapt quite straight; her husband got ready to haul her back in.

But the reception committee was ready for the exigency. One of them was swinging a weighted line around his head; he let the end of it swing farther and farther out. As she started to move past the side of the *War God* he swung it against her safety line; the weighted end wrapped itself around her line. Back at the *Rolling Stone* Roger Stone snubbed her line and stopped her; the man on the liner gently pulled her in.

The second man caught her and snapped a hook to her belt, then unfastened the long line from the *Stone.* Before she entered the lock she waved, and the door closed.

Roger Stone looked at the closed door for a moment, then pulled in the line. He let his eyes drop to the pair of little boots left standing empty beside him. He pulled them loose, held them to him, and plodded back to his own airlock.

IX - ASSETS RECOVERABLE

The twins kept out of their father's way for the next several days. He was unusually tender and affectionate with all of them but he never smiled and his mood was likely to flare suddenly and unexpectedly into anger. They stayed in their bunkroom and pretended to study they actually did study some of the time. Meade and Hazel split the care of Lowell between them; the child's feeling of security was damaged by the absence of his mother. He expressed it by temper tantrums and demands for attention.

Hazel took over the cooking of lunch and dinner; she was no better at it than Meade. She could be heard twice a day, burning herself and swearing and complaining that she was not the domestic type and never had had any ambitions that way. Never!

Dr Stone phoned once a day, spoke briefly with her husband, and begged off from speaking to anyone else for the reason that she was much too busy. Roger Stone's explosions of temper were most likely to occur shortly after these daily calls.

Hazel alone had the courage to quiz him about the calls. On the sixth day at lunch she said, 'Well, Roger? What was the news today? Give.'

'Nothing much. Hazel, these chops are atrocious.'.

'They ought to be good; I flavored 'em with my own blood.' She held out a bandaged thumb. 'Why don't you try cooking? But back to the subject. Don't evade me, boy.'

'She thinks she's on the track of something. So far as she can tell from their medical records, nobody has caught it so far who is known to have had measles.'

Meade said, 'Measles? People don't die of *that,* do they?'

'Hardly ever,' agreed her grandmother, 'though it can be fairly serious in an adult.'

'I didn't say it was measles,' her father answered testily, 'nor did your mother. She thinks it's related to measles, a mutant strain maybe more virulent.'

'Call it "neomeasles",' suggested Hazel. 'That's a good question-begging tag and it has an impressive scientific sound to it Any more deaths, Roger?'

'Well, yes.'

'How many?'

'She wouldn't say. Van is still alive, though, and she says that he is recovering. She *told* me,' he added, as if trying to convince himself, 'that she thought she was learning how to treat it.'

'Measles,' Hazel said thoughtfully. 'You've never had it, Roger.'

'No.'

'Nor any of the kids.'

'Of course not' put in Pollux. Luna City was by long odds the healthiest place in the known universe; the routine childhood diseases of Earth had never been given a chance to establish.

'How did she sound, Son?'

'Dog tired.' He frowned. 'She even snapped at me.'

'Not Mummy!'

'Quiet, Meade.' Hazel went on, 'I've had measles, seventy or eighty years ago. Roger, I had better go over and help her.'

He smiled without humor. 'She anticipated that. She said to tell you thanks but she had all the unskilled help she could use.'

'"Unskilled help!" I like that! Why, during the epidemic of '93 there were times when I was the only woman in the colony able to change a bed. Hummph!'

Hazel deliberately waited around for the phone call the next day, determined to get a few words at least with her daughter-in-law. The call came in about the usual time; Roger took it. It was not his wife.

'Captain Stone? Turner, sir Charlie Turner. I'm the third engineer. Your wife asked me to phone you.'

'What's the matter? She busy?'

'Quite busy.'

'Tell her to call me as soon as she's free. I'll wait by the board.'

'I'm afraid that's no good, sir. She was quite specific that she would not be calling you today. She won't have time.'

'Fiddlesticks! It will only take her thirty seconds. In a big ship like yours you can hook her in wherever she is.'

The man sounded embarrassed. 'I'm sorry, sir. Dr. Stone gave strict orders not to be disturbed'

'But confound it' I -'

'I'm very sorry, sir. Good-by.' He left him sputtering into a dead circuit.

Roger Stone remained quiet for several moments, then turned a stricken face to his mother. 'She's caught it.'

Hazel answered quietly, 'Don't jump to conclusions, Son.' But in her own heart she had already reached the same conclusion. Edith Stone had contracted the disease she had gone to treat.

The same barren stall was given Roger Stone on the following day; by the third day they gave up the pretence. Dr. Stone was ill, but her husband was not to worry. She had already, before she gave into it herself, progressed far enough in standardizing a treatment that all the new cases - hers among them - were doing nicely. So they said.

No, they would not arrange a circuit to her bed. No, he could not talk to Captain Vandenbergh; the Captain was still too ill.

'I'm coming over!' Roger Stone shouted.

Turner hesitated. 'That's up to you, Captain. But if you do, we'll have to quarantine you here. Dr. Stone's written orders.'

Roger Stone switched off. He knew that that settied it; in matters medical Edith was a Roman judge - and he could not abandon his own ship, his family, to get to Mars by themselves. One frail old woman, two cocksure half-trained student pilots - no, he had to take his ship in.

They sweated it out The cooking got worse, when anyone bothered to cook. It was seven endless, Earth-standard days later when the daily call was answered by, 'Roger - hello, darling!'

'Edith! Are you all right?'

'Getting that way.'

'What's your temperature?'

'Now, darling, I won't have you quack-doctoring me. My temperature is satistactory, as is the rest of my physical being. I've lost a little weight, but I could stand to - don't you think?'

'No, I don't. Listen - you come home! You hear me?'

'Roger dearest! I can't and that's settled. This entire ship is under quarantine. But how is the rest of my family?'

'Oh, shucks, fine, fine! We're all in the pink.'

'Stay that way. I'll call you tomorrow. Bye, dear.'

Dinner that night was a celebration. Hazel cut her thumb again, but not even she cared.

The daily calls, no longer a naging worry but a pleasure, continued. It was a week later that Dr. Stone concluded by saying 'Hold on, dear. A friend of yours wants to speak with you.'

'Okay, darling: Love and stuff - good-by.'

'Roger Dodger?' came a bass voice.

'Van! You squareheaded bay window! I knew you were too mean to die.'

'Alive and kicking, thanks to your wonderful wife. But no longer with a bay window; I haven't had time to regrow it yet'

'You will.'

'No doubt. But I was asking the good doctor about something and she couldn't give me much data. Your department Rog, how did this speed run leave you for singleH? Could you use some g-juice?'

Captain Stone considered it. 'Have you any surplus, Captain?'

'A little. Not much for this wagon, but it might be quite a lot for a kiddie cart like yours.'

'We had to jettison, did you know?'

'I know - and I'm sorry. I'll see that a claim is pushed through promptly. I'd advance it myself, Captain, if alimony on three planets left me anything to advance.'

'Maybe it won't be necessary.' He explained about the radar reflector. 'If we could nudge back into the old groove we just might get together with our belongings.'

Vandenbergh chuckled. 'I want to meet those kids of yours again; they appear to have grown up a bit in the last seven years.'

'Don't. They'll stea! your bridgework. Now about this singleH: how much can you spare?'

'Enough, enough, I'm sure. This caper is worth trying, just for the sport. I'm sure it has never been done before. Never.'

The two ships, perfectly matched to eye and almost so by instrument, nevertheless had drifted a couple. of miles apart while the epidemic in the liner raged and died out. The undetectable gravitational attraction between them gave them mutual escape velocity much less than their tiny residual relative motion. Up to now nothing had been done about it since they were still in the easiest of phone range. But now it was necessary to pump reactive mass from one to the other.

Roger Stone threw a weight fastened to a light messenger line as straight and as far as he could heave. By the time it was slowed to a crawl by the drag of the line a crewman from the *War God* came out after it on his suit jet, In due course the messenger line brought over a heavier line which was fastened to the smaller ship. Hand power alone took a strain on the line. While the mass of *Rolling Stone* was enormous by human muscle standards, the vector involved was too small to handle by jet and friction was nil. In warping in a space ship the lack of brakes is a consideration more important than numerous dents to ships and space stations testify.

As a result of that gentle tug, two and a half days later the ships were close enough to permit a fuel hose to be connected between them. Roger and Hazel touched the hose only with wrench and spacesuit gauntlet, not enough contact to affect the quarantine even by Dr. Stone's standards. Twenty minutes later even that connection was broken and the *Stone* had a fresh supply of jet juice.

And not too soon. Mars was a ruddy gibbous moon, bulging ever bigger in the sky; it was time to prepare to maneuver.

'There it is!' Pollux was standing watch on the radar screen; his yelp brought his grandmother floating over.

'More likely a flock of geese,' she commented, 'Where?'

'Right there. Can't you see it?'

Hazel grudgingly conceded that the blip might be real. The next several hours were spent in measuring distance, bearing, and relative motion by radar and doppler and in calculating the cheapest maneuver to let them match with the errant bicycles, baggage, and books. Roger Stone took it as easily as he could, being hurried somewhat by the growing nearness of Mars. He finally settled them almost dead in space relative to the floating junk pile, with a slight drift which would bring them within three hundred yards of the mass - so he calculated - at closest approach a few hours hence.

They spent the waiting time figuring the maneuvers to rendezvous with Mars. The *Rolling Stone* would not, of course, land on Mars but at the port on Phobos. First they must assume an almost circular ellipse around Mars matching with Phobos, then as a final maneuver they must settle the ship on the tiny moon - simple maneuvers made fussy by one thing only; Phobos has a period of about ten hours; the *Stone* would have to arrive not only at the right place with the right speed and direction, but also at the right time. After the bicycles were taken aboard the ship would have to be nursed along while still fairly far out if she were to fall to an exact rendezvous.

Everybody worked on it but Buster, Meade working under Hazel's tutelage. Pollux continued to check by radar their approach to their cargo. Roger Stone had run through and discarded two trial solutions and was roughing out another which, at last, seemed to be making sense when Pollux announced that his latest angulation of the radar data showed that they were nearly as close as they would get.

His father unstrapped himself and floated to a port. 'Where is it? Good heavens, we're practically sitting on it. Let's get busy, boys.'

'I'm coming, too,' announced Hazel.

'Me, too!' agreed Lowell.

Meade reached out and snagged him. 'That's what you think, Buster. You and Sis are going to play a wonderful game called, "What's for dinner?" Have fun, folks.' She headed aft, towing the infant against his opposition.

Outside the bicycles looked considerably farther away. Cas glanced at the mass and said. 'Maybe I ought to go across on my suit jet, Dad? It would save time.'

'I strongly doubt it. Try the heaving line, Pol.' Pollux snapped the light messenger line to a padeye. Near the weighted end had been fastened a half a dozen large hooks fashioned of 6-gauge wire. His first heave seemed to be strong enough but it missed the cluster by a considerable margin,

'Let me have it, Pol,' Castor demanded.

'Let him be,' ordered their father. 'So help me, this is the last time I'm going into space without a proper line-throwing gun. Make note of that, Cas. Put it on the shopping list when we go inside.'

'Aye aye, sir.'

The second throw was seen to hit the mass, but when Pol heaved in the line came away, the hooks having failed to catch. He tried again. This time the floating line came taut.

'Easy, now!' his father cautioned. 'We don't want a bunch of bikes in our lap. There - 'vast heaving. She's started.' They waited.

Castor became impatient and suggested that they give the line another tug. His father shook his head. Hazel added, 'I saw a green hand at the space station try to hurry a load that way. Steel plate, it was.'

'What happened?'

'He had started it with a pull; he thought he could stop it with a shove. They had to amputate both legs but they saved his life.' Castor shut up.

A few minutes later the disorderly mass touched down, bending a handlebar of one bike that got pinched but with no other damage. The twins and Hazel swarmed over the mass, working free on their safety lines and clicking on with their boots only to pass bicycles into the hold, where Roger Stone stowed them according to his careful mass distribution' schedule.

Present!y Pollux came across Castor's 'Not for Salvage' warning. 'Hey, Cas! Here's your notice.'

'It's no good now.' Nevertheless he accepted it and glanced at it. Then his eyes snapped wider.

An endorsement had been added at the bottom:

'Sez you!

'The Galactic Overlord.'

Captain Stone came out to investigate the delay, took the paper and read it. He looked at his mother. 'Hazel!'

'Me? Why, I've been right here in plain sight the whole time. How could I have done it?'

Stone crumpled the paper. 'I do not believe in ghosts, inside straights, nor "Galactic Overlords."'

If Hazel did it, no one saw her and she never admitted it. She persisted in the theory that the Galactic Overlord wasn't really dead after all. To prove it, she revived him in her next episode.

X - PHOBOS PORT

Mars has two readymade space stations, her two tiny, close-in moons - Phobos and Deimos, the dogs of the War God, Fear and Panic. Deimos is a jagged, ragged mass of rock; a skipper would he hard put to find a place to put down a ship. Phobos was almost spherical and fairly smooth as we found her; atomic power has manicured her into one big landing field all around her equator - a tidying-up that may have been over hasty; by one very plausible theory the Martian ancients used her themselves as a space station. The proof, if such there be, may lie buried under the slag of Phobos port.

The *Rolling Stone* slid inside the orbit of Deimos, blasted as she approached the orbit of Phobos and was matched in with Phobos, following an almost identical orbit around Mars only a scant five miles from that moon. She was falling now, falling *around* Mars but falling *toward* Phobos, for no vector had been included as yet to prevent that. The fall could not be described as a headlong plunge; at this distance, one radius of Phobos, the moon attracted the tiny mass of the spaceship with a force of less than three ten-thousandths of one Earth surface gravity. Captain Stone had ample time in which to calculate a vector which would let him land; it would take the better part of an hour for the *Stone* to sink to the surface of the satellite.

However, he had chosen to do it the easy way, through outside help. The jet of the *Rolling Stone,* capable of blasting at six gravities, was almost too much of a tool for the thin gravity field of a ten-mile rock - like swatting a fly with a pile-driver. A few minutes after they had ceased blasting, a small scooter rocket up from Phobos matched with them and anchored to their airlock.

The spacesuited figure who swam in removed his helmet and said, 'Permission to board, sir? Jason Thomas, port pilot - you asked for pilot-and-tow?'

'That's right' Captain Thomas.'

'Just call me Jay. Got your mass schedule ready?'

Roger Stone gave it to him; he look it over while they looked him over. Meade thought privately that he looked more like a bookkeeper than a dashing spaceman - certainly nothing like the characters in Hazel's show. Lowell stared at him gravely and said, 'Are you a Martian, Mister?'

The port pilot answered him with equal gravity. 'Sort of, son.'

'Then where's your other leg?'

Thomas looked startled, but recovered. 'I guess I'm a cut-rate Martian.'

Lowell seemed doubtful but did not pursue the point. The port official returned the schedule and said, 'Okay, Captain. Where are your outside control-circuit jacks?'

'Just forward of the lock. The inner terminals are here on the board.'

'Be a few minutes.' He went back outside, moving very rapidly. He was back inside in less than ten minutes.

'That's all the time it took you to mount auxiliary rockets?' Roger Stone asked incredulously.

'Done it a good many times. Gets to be a routine. Besides, I've got good boys working with me.' Quickly he plugged a small portable control board to the jacks pointed out to him earlier, and tested his controls. 'All set.' He glanced at the radar screen. 'Nothing to do but loaf for a bit You folks immgrating?'

'Not exactly. It's more of a pleasure trip.'

'Now ain't that nice! Though it beats me what pleasure you expect to find on Mars.' He glanced out the port where the reddish curve of Mars pushed up into the black.

'We'll do some sightseeing I expect'

'More to see in the State of Vermont than on this whole planet I know.' He looked around. 'This your whole family?'

'All but my wife.' Roger Stone explained the situation.

'Oh, yes! Read about it in the daily *War Cry*. They got the name of your ship wrong, though.'

Hazel snorted in disgust 'Newspapers!'

Yes, mum. I put the *War God* down just four hours ago. Berths 32 & 33. She's in quarantine, though.' He pulled out a pipe 'You folks got static precipitation?'

Yes,' agreed Hazel. 'Go ahead and smoke, young man.'

'Thanks on both counts.' He made almost a career of getting it lighted; Pollux began to wonder when he intended to figure his ballistic.

But Jason Thomas did not bother even to glance at the radar screen; instead he started a long and meandering story about his brother-in-law back Earthside. It seemed that this connection of his had tried to train a parrot to act as an alarm clock.

The twins knew nothing of parrots and cared less. Castor began to get worried. Was this moron going to crash the *Stone?* He began to doubt that Thomas was a pilot of any sort. The story ambled on and on. Thomas interrupted himself to say, 'Better hang on, everybody. And somebody ought to hold the baby.'

'I'm not a baby,' Lowell protested.

'I wish I was one, youngster.' His hand sought his control panel as Hazel gathered Lowell in. 'But the joke of the whole thing was - A deafening rumble shook the ship, a sound somehow more earsplitting than their own jet. It continued for seconds only, as it died Thomas continued triumphantly:

- the bird never did learn to tell time. Thanks, folks. The office'll bill you.' He stood up with a catlike motion, slid across or without lifting his feet 'Glad to have met you. G'bye!'

They were down on Phobos.

Pollux got up from where he had sprawled on the deckplates - and bumped his head on the overhead. After that he tried to walk like Jason Thomas. He had weight, real weight, for the first time since Luna, but it amounted to only two ounces in his clothes. 'I wonder how high I can jump here?' he said.

'Don't try it,' Hazel advised. 'Remember the escape velocity of this piece of real estate is only sixty-six feet a second.'

'I don't think a man could jump that fast'

'There was Ole Gunderson. He dived right around Phobos - a free circular orbit thirty-five miles long. Took him eighty-five minutes. He'd have been traveling yet. If they hadn't grabbed as he came back around.'

'Yes, but wasn't he an Olympic jumper or something? And didn't he have to have a special rack or some such to take off from?'

'You wouldn't have to jump,' Castor put in. 'Sixty-six feet a second is fortyfive miles an hour, so the circular speed comes out a bit more than thirty miles an hour. A man can run twenty miles an hour back home, easy. He could certainly get up to fortyfive here.'

Pollux shook tiis head. 'No traction.'

'Special spiked shoes and maybe a tangent launching ramp for the last hundred yards - then *woosh!* off the end and you're gone for good.'

'Okay, you try it, Grandpa. I'll wave good-by to you.'

Roger Stone whistled loudly. 'Quiet, please! If you armchair athletes are quite through, I have an announcement to make.'

'Do we go groundside now, Dad?'

'Not if you don't quit interrupting me. I'm going over to the *War God.* Anyone who wants to come along, or wishes to take a stroll outside, may do so - just as long as you settle the custody of Buster among you. Wear your boots; I understand they have steel strip walkways for the benefit of transients.'

Pollux was the first one suited up and into the lock, where he was surprised to find the rope ladder still rolled up. He wondered about Jason Thomas and decided that he must have jumped. . . a hundred-odd feet of drop wouldn't hurt a man's arches here. But when he opened the outer door he discovered that it was quite practical to walk straight down the side of the ship like a fly on a wall. He had heard of this but had not quite believed it, not on a *planet* . . . well, a moon.

The others followed him, Hazel carrying Lowell. Roger Stone stopped when they were down and looked around. 'I could have sworn,' he said with a puzzled air, 'that I spotted the *War God* not very far east of us just before we landed.'

'There is something sticking up over there,' Castor said, pointing north. The object was a rounded dome swelling up above the extremely near horizon - an horizon only two hundred yards away for Castor's height of eye: The dome looked enormous but it grew rapidly smaller as they approached it and finally got it entirely above the horizon. The sharp curvature of the little globe played tricks on them;

it was so small that it was possible to see that it was curved, but the habit of thinking of anything over the horizon as distant stayed with them.

Before they reached the dome they encountered one of the steel walking strips running across their path, and on it a man. He was spacesuited as they were and was carrying with ease a large coil of steel line, a hand-powered winch, and a ground anchor with big horns. Roger Stone stopped him. 'Excuse me, friend but could you tell me the way to the R.S. *War God?* Berths thirty-two and -three, I believe she is.'

Off east there. Just follow this strip about five miles; you'll raise her. Say, are you from the *Rolling Stone?'*

'Yes. I'm her master. My name's Stone, too.'

'Glad to know you, Captain. I'm just on my way out to respot your ship. You'll find her in berth thirteen, west of here when you come back.'

The twins looked curiously at the equipment he was carrying. 'Just with that?' asked Castor, thinking of the ticklish problem it had been to move the *Stone* on Luna.

'Did you leave your gyros running?' asked the port jockey.

'Yes,' answered Captain Stone.

'I won't have any trouble. See you around.' He headed out to the ship. The family party turned east along the strip; the traction afforded by their boot magnets against steel made much easier walking. Hazel put Lowell down and let him run.

They were walking toward Mars, a great arc of which filled much of the eastern horizon. The planet rose appreciably as they progressed; like Earth in the Lunar sky Mars never rose nor set for any particular point of the satellite's surface - but they were moving over the curve of Phobos so rapidly that theff own walking made it rise. About a mile farther along Meade spotted the bow of the *War God* silhouetted against the orange-red face of Mars. They hurried, but it was another three miles before they had her in sight down. to her fins.

At last they reached her - to find a temporary barrier of line and posts around her and signs prominently displayed:

'WARNING! - QUARANTINE - no entrance by order of Phobos Port Authority.'

I can t read,' said Hazel.

Roger Stone pondered it 'The rest of you stay here, or go for a walk - whatever you please. I'm going in. Mind you stay off the field proper.'

'Shucks,' answered Hazel, 'there's plenty of time to see a ship coming in and run for it, the way they float in here. That's all the residents do. But don't you want me to come with you, boy?'

'No its my pidgin.' He left them at the barrier, went toward the liner. They waited. Hazel passed the time by taking a throat lozenge from her gun and popping it in through her mouth valve; she gave one to Lowell. Presently they saw Roger walk up the side of the ship to a view port. He stayed there quite a whlle, then walked down again.

When he got back to them his face was stormy. Hazel said 'No go, I take it?'

'None at all. Oh, I saw Van and he rapped out some irrelevant insults. But he did let me see Edith - through the port'

'How did she look?'

'Wonderful, just wonderful! A little bit thinner perhaps, but not much. She blew a kiss for all of you.' He paused and frowned. 'But I can't get in and I can't get her out.'

'You can't blame Van,' Hazel pointed out. 'It would mean his ticket.'

'I'm not blaning anybody! I'm just mad, that's all.'

'Well, what next?'

He thought about it. 'The rest of you do what you like for the next hour or so. I'm going to the administration building - it's that dome back there. I'll meet you all at the ship - berth thirteen.'

The twins elected to walk on east while Meade and Hazel returned at once to the ship Buster was getting restless. The boys wanted a really good look at Mars. They had watched it through the *Stone's* ports, of course, on the approach - but this was different. . . more real, somehow - not framed like a television shot. Three more miles brought all of it in sight, or all of it that was illuminated, for the planet was in half phase to them, the Sun being at that point almost overhead.

They studied the ruddy orange deserts, the olive green fertile stretches, the canals stretching straight as truth across her fiat landscape. The south polar cap was tipped slightly toward them; it had almost disappeared. Facing them was the great arrowhead of Syrtis Major.

They agreed that it was beautiful, almost as beautiful as Luna - more beautiful perhaps than Earth in spite of Earth's spectacular and always changing cloud displays. But after a while they grew bored with it and headed back to the ship.

They found berth thirteen without trouble and walked up into the ship. Meade had dinner ready; Hazel was playing with Buster. Their father came in just as they were ready to eat. 'You,' announced Hazel, 'looked as if you had bribed a chairwarmer.'

'Not quite.' He hesitated, then said, 'I'm going into quarantine with Edith. I'll come out when she does.'

'But Daddy -' protested Meade.

'I'm not through. While I'm gone Hazel takes command. She is also head of this family.'

'I always have been,' Hazel said smugly.

'Please, Mother. Boys, if she finds it necessary to break your arms, please be advised that the action is authorised in advance. You understand me?'

'Yes sir. - 'Aye aye, sir.'

'Good. I'm going to pack now and leave.'

'But Daddy!' Meade objected, almost in tears, 'aren't you going to wait for dinner?'

He stopped and smiled. 'Yes, sugar pie. You are getting to be a good cook, did you know?'

Castor glanced at Pollux, then said, 'Uh, Dad, let me get this straight We are simply to wait here in the ship - on this undersized medicine ball until you and Mother get out of hock?'

'Why, yes - no, that isn't really necessary. I simply hadn't thought about it. If Hazel is willing, you can close down the ship and go down to Mars. Phone us your address and we'll join you there. Yes, I guess that's the best scheme.'

The twins sighed with relief.

XI - 'WELCOME TO MARS!'

Roger Stone promptly caught the epidemic disease and had to be nursed through it - and thereby extended the quarantine time It gave the twins that much more time in which to exercise their talent for trouble. The truncated family went from Phobos down to Marsport by shuttle - not the sort of shuttle operating between Pikes Peak and Earth's station, but little glider rockets hardly more powerful than the ancient German war rockets. Mars' circular-orbit speed is only a trifle over two miles per second.

Nevertheless the fares were high . . . and so were freight charges The twins had unloaded their cargo, moved it to the freight lots between the customs shed and the administration building and arranged for it to follow them down, all before they boarded the shuttle. They had been horrified when they were presented with the bill - payable in advance. It had come to more than the amount they had paid their father for the added ship's costs of boosting the bicycles all the way to Mars.

Castor was still computing their costs and possible profits as the five Stones were strapping down for the trip down to Marsport. 'Pol, he said fretfully, 'we'd better by a darn sight get a good price for those bikes.'

'We will, Grandpa, we will. They're good bikes.'

The thuttle swooped to a landing on the Grand Canal and was towed into a slip, rocking gently the while. The twins were glad to climb out; they had never before been in a waterborne vehicle and it seemed to them an undependable if not outright dangerous mode of travel. The little ship was unsealed with a soft sigh and they were breathing the air of Mars. It was thin but the pressure was not noticeably lower than that they had maintained in the *Rolling Stone* - a generation of the atmosphere project had made skin suits and respirators unnecessary. It was not cold; the Sun was right at the zenith. Meade sniffed as she climbed to the dock. 'What's the funny smell, Hazel?'

'Fresh air. Odd stuff, isn't it? Come on, Lowell.' They all went inside the Hall of Welcome, that being the only exit. from the dock. Hazel looked around, spotted a desk marked 'Visas' and headed for it. 'Come on, kids Let's stick together.'

The clerk looked over their papers as if he had never seen anything of the sort before and didn't want to now. 'You had your physical examinations at Phohos port?' he said doubtfully.

'See for yourself. They're all endorsed.'

'Well. . . you don't have your property declaration filled out for immigration.'

'We're not imrnjgrants; we're visitors.'

'Why didn't you say so? You haven't posted a bond; all terrestrial citizens have to post bonds.'

Pollux looked at Castor and shook his head. Hazel counted up to ten and replied, 'We're not terrestrials; we're citizens of Luna Free State - and entitled to full reciprocity under the treaty of '07. Look it up and see.'

'Oh.'. The clerk looked baffled and endorsed and stamped their papers. He stuck them in the stat machine, then handed them back. 'That'll be five pounds.'

'Five pounds?'

'Pounds Martian, of course. If you apply for citizenship it's returnable.'

Hazel counted it out. Pollux converted the figure into System credit in his head and swore under his breath; he was beginning to think that Mars was the Land of the Fee. The clerk. recounted the money, then reached for a pile of pamphlets, handed them each one. 'Welcome to Mars,' he said, smiling frigidly. 'I know you'll like it here.'

'I was beginning to wonder,' Hazel answered, accepting a pamphlet

'Eh?'

'Never mind. Thank you.'

They turned away. Castor glanced at his pamphlet; it was titled:

WELCOME TO MARS! ! !
Compliments
of the Marsport
Chamber of Commerce &
Booster Club

He skimmed the table of contents: What to See - Where to Eat - And Now to Sleep - 'When in Rome-' - In Ancient Times - Souvenirs? of course - Business Opportunities - Facts & Figures about Marsport, Fastest Growing City in the System.

The inside, he found, contained more advertising space than copy. None of the pictures were stereo. Still, it was free; he stuck it in his pouch.

They had not gotten more than ten steps away when the clerk suddenly called out, 'Hey I Madam I Just a moment, please-comeback!'

Hazel turned around and advanced on him, her mouth set grimly. 'What's biting you, bub?'

He pointed to her holster. 'That gun. You can't wear that - not in the city limits.'

'I can't, eh?' She drew it, opened the charge chamber, and offered it to him with a sudden grin. 'Have a cough drop?'

A very pleasant lady at the Travellers' Aid desk, after determining that they really did not want to rent an ancient Martian tower believed to be at least a million years old but sealed and airconditioned nevertheless, made out for them a list of housekeeping apartments for rent. Hazel had vetoed going to any of the tourist hotels even for one night, after telephoning three and getting their rates. They tramped through a large part of the city, searching. There was no public transit system; many of the inhabitants used powered roller skates, most of them walked. The city was laid out in an oblong checkerboard with the main streets parallel to the canal. Except for a few remaining pressurised domes in 'Old Town' the buildings were all one-storey prefabricated boxlike structures without eaves or windows, all of depressing monotony.

The first apartment turned out to be two little stalls in the back of a private home - share refresher with family. The second was large enough but was in sniffing range of a large plastics plant; one of its exhaltations seemed to be butyl mersaptan though Hazel insisted it put her more in mind of a dead goat The third - but none of them approached the standard of comfort they had enjoyed on the Moon, nor even that of the *Rolling Stone.*

Hazel came out of the last one they had jooked at, jumped back suddenly to keep from being run over by a delivery boy pulling a large hand truck, caught her breath and said, 'What'll it be, children? Pitch a tent, or go back up to the *Stone?'*

Pollux protested, 'But we can't do that We've got to sell our bicycles.'

'Shut up, Junior,' his brother told him 'Hazel, I thought there was one more? "Casa" something?'

'Casa Mañana Apartments, way out south along the canal - and likely no better than the rest Okay, troops, mush on!'

The buildings thinned out and they saw some of the heliotropic

Martian vegetation, spreading greedy hands to the Sun. Lowell began to complain at the walk. 'Carry me, Grandma Hazel!'

'Nothing doing, pet', she said emphatically, 'your legs are younger than mine.'

Meade stopped. 'My feet hurt, too.'

'Nonsense! This is just a shade over one-third gravity.'

'Maybe so, but it's twice what it is back home and we've been in free fall for half a year and more. Is it much farther?'

'Sissy!'

The twins' feet hurt, too, but they would not admit it They alternated taking Buster piggyback the rest of the way. Casa Mañana turned out to be quite new and, by their suddenly altered standards, acceptable. The walls were of compacted sand, doubled against the bitter nights; the roof was of sheet metal sandwich with glass-wool core for insulation. It was a long, low building which made Hazel think of chicken coops but she kept the thought to herself. It had no windows but there were sufficient glow tubes and passable air ducting.

The apartment which the owner and manager showed to them consisted of two tiny cubicles, a refresher, and a general room. Hazel looked them over. 'Mr d'Avril, don't you have something a bit larger?'

'Well, yes, ma'am, I do - but I hate to rent larger ones to such a small family with the tourist season just opening up: I'll bring in a cot for the youngster.'

She explained that two more adults would be coming. He considered this. 'You dbn't know how long the *War God* will *be* quarantined?

'Not the slightest'

'Then why don't we play that hand after it's dealt? We'll accomodate you somehow; that's a promise.'

Hazel decided to close the deal; her feet were killing her. 'How much?'

'Four hundred and fifty a month - four and a quarter if you take a lease for the whole season.'

At first Hazel was too surprised to protest She had not inquired rents at the other places since she had not considered renting them. 'Pounds or credits?' she said feebly.

'Why, pounds, of course.'

'See here, I don't want to buy this du - this place. I just want to use it for a while.'

Mr d'Avril looked hurt. 'You needn't do either one, ma'am. With ships arriving every day now I'll have my pick of tenants. My prices are considered very reasonable. The Property Owner's Association has tried to get me to up 'em - and that's a fact'

Hazel dug into her memory to recall how to compare a hotel price with a monthly rental - add a zero to the daily rate; that was it Why, the man must be telling the truth! - if the hotel rates she had gotten were any guide. She shook her head. 'I'm just a country girl, Mr d'Avril. How much did this place cost to build?'

Again he looked hurt 'You're not looking at it properly, ma'am. Every so often we have a big load of tourists dumped on us. They stay awhile, then they go away and we have no rent coming in at all. And you'd be surprised how these cold nights nibble away at a house. We can't build the way the Martians could.'

Hazel gave up. 'Is that season discount you mentioned good from now to Venus departure?'

'Sorry, ma'am. It has to be the whole season.' The next favorable time to shape an orbit for Venus was ninety-six Earth-standard days away - ninety-four Mars days - whereas the 'whole season' ran for the next fifteen months, more than half a Martian year before Earth and Mars would again be in a position to permit a minimum-fuel orbit.

'We'll take it by the month. May I borrow your stylus? I don't have that much cash on me.'

Hazel felt better after dinner. The Sun was down and the night would soon be too bitter for any human not in a heated suit, but inside Casa Mañana it was cozy, even though cramped. Mr d'Avril, for an extra charge only mildly extortionate, had consented to plug in television for them and Hazel was enjoying for the first time in months one of her own shows. She noted that they had rewritten it in New York, as usual, and, again as usual, she found the changes no improvement. But she could recognise some of the dialogue and most of the story line.

That Galactic Overlord - he was a baddy, he was! Maybe she should kill him off agaih.

They could try to find a cheaper place tomorrow. At least as long as the show kept up its audience rating the family wouldn't starve, but she hated to think of Roger's face when he heard what rent he was paying. Mars! All right to visit, maybe, but no place to live. She frowned.

The twins were whispering in their own cubicle about some involved financial dealing; Meade was kitting quietly and watching the screen. She caught Hazel's expression. 'What were you thinking about, Grandmother?'

'*I* know what she's thinking about!' announced Lowell.

'If you do, keep it to yourself. Nothing much, Meade - that pipsqueak clerk. Imagine the nerve of him, saying I couldn't pack a gun!'

XII - FREE ENTERPRISE

The twins started out to storm the marts of trade next morning after breakfast Hazel cautioned them. 'Be back in time for dinner. And try not to commit any capital crimes.'

'What are they here?'

'Um, let me see. Abandonment without shelter. . . pollution of the water supply . . . violation of treaty regulations with the natives - I think. that's about all.'

'Murder?'

'Killing is largely a civil matter here - but they stick you for the prospective earnings of your victim for whatever his life expectancy was. Expensive. Very expensive, if the prices we've run into are any guide. Probably leave you indentured the rest of your life.'

'Hmm - We'll be careful. Take note of that, Pol. Don't kill anybody.'

'*You* take note of it. You're the one with the bad temper.'

'Back sharp at six, boys. Have you adjusted your watches?'

'Pol slowed his down; I'm leaving mine on Greenwich rate.'

'Sensible.'

'Pol!' put in Lowell. 'Cas! Take me along!'

'Can't. do it, sprout. Business.'

'Take me! I want to see a Martian. Grandma Hazel, *when* am I going to. see a Martian?'

She hesitated. Ever since an unfortunate but instructive incident forty years earlier a prime purpose of the planetary government had been to keep humans as far away from the true Martians as possible - tourists most especially. Lowell had less chance of getting his wish than a European child visiting Manhattan would have of seeing an American Indian. 'Well, Lowell, it's like this -The twins left hastily, not wishing to be drawn into what was sure to be a fruitless debate.

They soon found the street catering to the needs of prospectors. They picked a medium-sized shop displaying the sign of Angelo & Sons, Ltd., General Outfitters, which promised 'Bedrolls, Geiger Counters, Sand Cycles, Assaying Service, BlackLight Lamps, Firearms, Hardware-Ironmongery - Ask for It; We've Got It or Can Get It'.

Inside they found a single shopkeeper leaning against a counter while picking his teeth and playing with something that moved on the counter top. Pollux glanced curiously at it; aside from the fact that it was covered with fur and seemed to be rougly circular, he could not make out what it was. Some sort of Martian dingus probably. He would investigate later - business first.

The shopkeeper straightened up and remarked with professional cheer, 'Good morning, gentlemen. Welcome to Mars.'

'How did you know?' asked Castor.

'Know what?'

'That we had just gotten here.'

'Eh? That's hard to say. You've still got some free fall in your walk and - oh, I don't know. Little things that add up automatically. You get to know.'

Pollux shot Castor a glance of warning; Castor nodded. This man's ancestors, he realised subconsciously, had plied the Mediterranean, sizing up customers, buying cheap and selling dear. 'You're Mr Angelo?'

'I'm Tony Angelo. Which one did you want?'

'Uh, no one in particular, Mr Angelo. We were just looking around.'

'Help yourselves. Looking for souvenirs?'

'Well, maybe.'

'How about this?' Mr Angelo reached into a box behind him and pulled out a battered face mask. 'A sandstorm mask with the lenses pitted by the sands of Mars. You can hang it up in your parlor and tell a real thiller about how it got that way and how lucky you are to be alive. It won't add much to your baggage weight allowance and I can let you have it cheap - I'd have to replace the lenses before I could sell it to the trade.'

Pollux was beginning to prowl the stock, edging towards the bicycles; Castor decided that he should keep Mr Angelo engaged while his brother picked up a few facts, 'Well, I don't know,' he replied. 'I wouldn't want to tell a string of lies about it'

'Not Lies, just creative storytelling. After all, it could have happened - it did happen to the chap that wore it; I know him. But never mind.' He put the mask back. 'I've got some honest-to-goodness Martian gems, only K'Raath HimseIf knows how old - but they are very expensive. And I've got some others that can't be told from the real ones except in a laboratory under polarised light; *they* come from New Jersey and aren't expensive at all. What's your pleasure?'

'Well, I don't know,' Castor repeated, 'Say Mr Angelo, what is this? At first I thought it was a fur cap; now I see its alive'

Castor pointed to the furry heap on the counter. It was slowly slithering toward the edge.

The shopkeeper reached out and headed it back to the middle. 'That? That's a "flat cat".'

'"Flat cat?"'

'It has a Latin name but I never bothered to learn it.' Angelo tickled it with a forefinger; it began to purr like a highpitched buzzer. It had no discernible features, being merely a pie-shaped mass of sleek red fur a little darker than Castor's own hair. 'They're affectionate little things and many of the sand rats keep them for pets - a man has to have someone to talk to when he's out prospecting and a flat cat is better than a wife because it can't talk back. It just purrs and snuggles up to you. Pick it up.'

Castor did so, trying not seem gingerly about it The flat cat promptly plastered itself to Castor's shirt, fattened its shape a little to fit better the crook of the boy's arm, and changed its purr to a low throbbing which Castor could feel vibrate in his chest. He looked down and three beady little eyes stared trust-fully back up at him, then closed and disappeared completely. A little sigh interrupted the purrs and the creature snuggled closer.

Castor chuckled 'It is like a cat, isn't it?

'Except that it doesn't scratch. Want to buy it?'

Castor hesitated. He found himself thinking of Lowell's anxiety to see a 'real Martian'. Well, this was a 'Martian', wasn't it? A sort of a Martian. 'I wouldn't know how to take care of it'

'No trouble at all. In the first place they're cleanly little heasties - no problem that way. And they'll eat anything; they *love* garbage. Feed it every week or so and let it have all the water it will take every month or six weeks - it doesn't matter really; if it isn't fed or watered it just slows down until it is. Doesn't hurt a bit And you don't even have see that it keeps warm. Let me show you.' He reached out and took the flat cat back, jiggled it in his hand. It promptly curled up into a ball.

'See that? Like everything else on Mars, it can wrap itself up when the weather is bad. A real survivor type.' The shopkeeper started to mention another of its survival characteristics, then decided it had no bearing on the transaction. 'How about it? I'll make you a good price.'

Castor decided that Lowell would love it - and besides, it was a legitimate business expense, claargeable to good will. 'How much?'

Angelo hesitated, trying to estimate what the traffic would bear, since a flat cat on Mars had roughly the cash value of still another kitten on a Missouri farm. Still, the boys must be rich or they wouldn't be here - just in and with spending money burning holes in their pockets, no doubt Business had been terrible lately anyhow. 'A pound and a half', he said firmly.

Castor was surprised at how reasonable the price was. 'That seems like quite a lot,' he said automatically.

Angelo shrugged. 'It likes you. Suppose we say a pound?' Castor was again surprised, this time at the speed and the size of the mark-down. 'I don't know,' he murmured.

"Well. . . ten per cent off for cash.'

Out of the corner of his eye Castor could see that Pollux had finished inspecting the rack of bicycles and was coming back. He decided to clear the decks and establish that good will, if possible, before Pol got down to business. 'Done.' He fished out a pound note, received his change, and picked up the flat cat 'Come to papa, Fuzzy Britches.' Fuzzy Britches came to papa, snuggled up and purred.

Pollux came back, stared at the junior Martian. 'What in the world?'

'Meet the newest member of the family. We just bought a flat cat'

'We?' Pollux started to protest that it was no folly of his, but caught the warning in Castor's eye in time. 'Uh, Mr. Angelo, I don't see any prices marked?'

The shopkeeper nodded. 'That's right The sand rats like to haggle and we accommodate them. It comes to the same thing in the long run. We always settle at list: they know it and we know it, but it's part of their social life. A prospector doesn't get much.'

'That Raleigh Special over there - what's the list on it?' Pollux had picked it because it looked very much like the sand-cycle their father had delivered for them to Captain Vandenbergh when he had gone into quarantine.

'You. want to buy that bike?'

Castor shook his head a sixteenth of an inch; Pollux answered, 'Well, no, I was just pricing it. I couldn't take it Sunside. you know.'

'Well, seeing that there are no regular customers around, I'll tell you. List is three hundred and seventy-five - and a bargain!'

'Whew! That seems high.'

'A bargain. She's a real beauty. Try any of the other dealers.'

'Mr. Angelo,' Castor said carefully, 'suppose I offered to sell you one just like it, not new but reconditioned as good as new and looking new, for just half that?'

'Eh? I'd probably say you were crazy'

'I mean it I've got it to sell. You might as well have the benefit of the low price as one of your competitors, I'm not going to offer it retail; this is for dealers.'

'Mmm. . . you didn't come in here to buy souvenirs, did you?'

'No, sir.'

'If you had come to me with that proposition four months ago, and could have backed it up, I'd have jumped at it. Now. . . well, no.'

'Why not? it's a good bike I'm offering you. A real bargain.'

'I'm not disputing it' He reached out and stroked the flat cat 'Shucks, it can't hurt anything to tell you why. Come along.'

He led them into the rear, past shelves crammed with merchandise, and on out behind the store. He waved a hand at stacks of merchandise that looked all too familiar. 'See that? Secondhand bikes. That shed back there is stuffed with 'em; that's why I've got these stored in the open.'

Castor tried to keep surprise and dismay out of his voice. 'So you've got secoud-hand bikes', he said, 'all beat-up and sand pitted. I've got secondhand bikes that look like new and will wear like new - and I can sell them cheaper than you can sell these, a lot cheaper. Don't you want to bid on them, at least?'

Angelo shook his head. 'Brother, I admit that I didn't take you for a jobber. But I have bad news for you. You can't sell them to me; you can't sell them to my competitors; you can't sell them anywhere.'

'Why not?'

'Because there aren't any retail customers.'

'Huh?'

'Haven't you heard of the Hallelujah Node? Didn't you notice I didn't have any customers? Three fourths of the sand rats on Mars are swarming into town - but they're not buying, leastwise not bicycles. They're stocking up for the Asteroids and kicking in together to charter ships. That's why I have used bikes; I had to take them back on chattel mortgages -and that's why you can't sell bikes. Sorry - I'd like to do business with you.'

The twins had heard of the Hallelujah, all right - the news bad reached them in space: a strike of both uraniuna and core metal out in the Asteroids. But they had given it only intellectual attention, the Asteroids no longer figuring into their plans.

'Two of my brothers have aleady gone', Angelo went on, 'and I might give it a whirl myself if I weren't stuck with the store. But I'd close and reopen as strictly a tourist trap if I could unload my present stock. That's how bad things are.'

They crept out into the street as soon as they could do so gracefully. Pollux looked at Castor. 'Want to buy a bicycle, sucker?'

'Thanks, I've got one. Want to buy a flat cat?'

'Not likely. Say, let's go over to the receiving dock. If any tourists are coming in, we might find another sucker to unload that thing on. We might even show a small profit - on flat cats, that is.'

'No, you don't. Fuzzy Britches is for Buster - that's settled. But let's go over anyway; our bikes might be down.'

'Who Ceres?'

'I do. Even if we can't sell them, we can ride a couple of them. My feet hurt.'

Their shipment was not yet down from Phobos but it was expected about an hour hence. They stopped in the Old Southern Dining Room & Soda Fountain across from the Hall of Welcome. There they nursed sodas, petted Fuzzy Britches, and considered their troubles. 'I don't mind losing the money so much - ' Castor started in.

'I do!'

'Well, so do I. But what really hurts is the way Dad will laugh when he finds out. And what he'll say.'

'Not to mention Hazel.'

'Yes, Hazel. Junior, weve just got to figure out some way of picking up some money before we have to tell them.'

'With what? Our capital is gone. And Dad wouldn't let us touch any more of our money even if he were here - which he isn't.'

'Then it has to be a way without capital.'

'Not many. Not for real money.'

'Hazel makes plenty credits without capital.'

'You aren't suggesting that we write a television serial?' Pollux sounded almost shocked.

'Of course not. We don't have a customer for one. But there must be a way. Start thinking.'

After a glum silence Pollux said, 'Grandpa, did you notice that announcement in the Hall of Welcome of the Mars chess championship matches next month?'

'No. Why?'

'People bet on 'em here - same as race horses Earthside.'

'I don't like bets. You can lose.'

'Sometimes. But suppose we entered Buster?'

'Huh? Are you crazy? Enter him against the best players on Mars?'

'Why not? Hazel used to be Luna champion, but Buster beats her regularly.'

'But you know why. He reads her mind.'

'That's precisely what I am talking about'

Castor shook his head. 'It wouldn't be honest, Junior.'

'Since when did they pass a law against telepathy?'

'Anyhow you don't know for certain that he does read her mind. And you don't know that he could read a stranger's mind. And it would take plenty cash to set up a good bet - which we haven't got. And besides, we might lose.

'Okay, okay, it was just a thought You produce one.'

Castor frowned. 'I don't have one. Let's go back over and see if our bikes are in. If they are, let's treat ourselves to a day off and go sightseeing. We might as well get some use out of those bikes; they cost us enough.' He stood up.

Pollux sat still and stared at his glass. Castor added, 'Come on.'

Pollux said, 'Sit down, Grandpa. I think I'm getting an idea.'

'Don't frighten it'

'Quiet' Presently Pollux said, 'Grandpa, you and I have just arrived here. We want to go sightseeing - so we immediately think of our bikes. Why wouldn't tourists like to do the same thing - and pay for it?'

'Huh?' Castor thought about it 'There must be some catch in it - or somebody would have done it long before this.'

'Not necessarily. it has only been the past few years that you could get a tourist visa to Mars; you came as a colonist or you didn't come at all. I'd guess that nobody has thought of shipping bikes to Mars for tourists. Bikes cost plenty and they have been imported just for prospectors - for *work,* because a sand rat could cover four or five times as much territory on a sand cycle as on foot I'll bet nobody here has ever thought of them for pleasure.'

'What do you want us to do? Paint a sign and then stand under it, shouting, "Bicycles! Get your bicycle here! You can't see the sights of Mars without a bicycle".'

Pollux thought it over. 'We could do worse. But we would do better to try to sell somebody else on it, somebody who has the means to get it going. Shucks, we couldn't even rent a lot for our bike stand.'

'There's the soft point in the whole deal. We tell somebody and what does he do? He doesn't buy our bikes; he goes to Tony Angelo and makes a deal with him to put Angelo's bikes to work, at a lower cost.'

'Use your head, Grandpa. Angelo and the other dealers won't rent their new machines to tourists; they cost too much. And tourists won't rent that junk Angelo has in his back lot, they're in a holiday mood; they'll go for something new and shiny and cheerful. And for rental purposes. Remember, our bikes aren't just practically new; they are new. Anybody who rents anything knows it has been used before; he's satisfied if it looks new.

Castor stood up again. 'Okay, you've sold me. Now let's see if you can sell it to somebody else. Pick a victim.'

'Sit down; what's your hurry? Our benfactor is probably right under this roof.'

'Huh?'

'What's the first thing a tourist sees when he first comes out of the Hall of Welcome? The Old Southern Dining Room, that's what. The bike stand ought to be right out in front of this restaurant'

'Let's find the owner.'

Joe Pappalopoulis was in the kitchen; he came out wiping his hands on his apron. 'What's the matter, boys? You don't like your soda?

'Oh, the sodas were swell! Look, Mr Pappalopoulis, can you spare us a few minutes?'

'Call me "Poppa"; you wear yourself out. Sure.'

'Thanks. I'm Cas Stone; this is my brother Pol. We live on Luna and we came in with a load you might be interested in.'

'You got a load of imported food? I don't use much. Just coffee and some flavors.'

'No, no, not food. How would you like to add a new line that would fit right in with your restaurant business? Twice as much volume and only one overhead.'

The owner took out a knife and began to pare his nails. 'Keep talking.'

Pollux took over, explained his scheme with infectious enthusiasm. Pappalopoulis looked up from time to time, said nothing. When Pollux seemed to be slowing down Castor took over; 'Besides renting them by the hour, day, or week, you set up sightseeing tours and charge extra for those.'

'The guides don't cost you any salary; you make 'em pay for the concession and then allow them a percentage of the guide fee.'

'They rent their own bikes from you, too.'

'No overhead; you've already got the best spot in town. You just arrange to be out in front every time a shuttle comes down and maybe pay one of your guides a commission on rentals he makes to watch the stand in between times.'

'But the best deal is the long-term lease. A tourist uses a bike one day; you point out to him how cheap he can get it for the full time of his stay and you get the full price of the bike back in one season. From then on you're operating on other people's money.

The restaurateur put his knife away and said, 'Tony Angelo is a good businessman. Why don't I buy secondhand bikes from him - cheap?

Castor took the plunge. 'Go look at his bikes. Just look at them, sand pits and wornout tires and all. Then we'll meet his price - with better bikes.'

'Any price he names?'

'Any firm price, not a phony. If his price is really low, we'll buy his bikes ourselves.' Pollux looked a warning but Castor ignored it 'We can undersell any legitimate price he can afford to make - with better merchandise. Let's go see his bikes.'

Pappalopoulis stood up. 'I've seen bikes in from the desert We go see yours.'

'They may not be down yet' But they were down. Joe Poppa looked them over without expression, but the twins were very glad of the hours they had spent making them brave with paint, gaudy with stripes, polish and new decals.

Castor picked out three he knew to be in tiptop shape and said, 'How about a ride? I'd like to do some sightseeing myself - free.

Pappalopoulis smiled for the first time. 'Why not?'

They rode north along the canal clear to the power pile station, then back to the city, skirted it, and right down Clarke Boulevard to the Hall of Welcome and the Old Southern Dining Room. After they had dismounted and returned the vehicles to the pile. Castor signaled Pollux and waited silently.

The cafe owner said nothing for several moments. At last he said, 'Nice ride, boys. Thanks.'

'Don't mention it'

He stared at the heap of bikes. 'How much?'

Castor named a price. Pappalopoulis shook his head sadly, 'That's a lot of money.'

Before Pollux could name a lower price Castor said, 'Make it easy on yourself. We'd rather be cut in on the gravy but we thought you might prefer to own them yourselves. So let's make it a partnership; you run the business, we put up the bikes. Even split on the gross and you absorb the overhead. Fair enough?'

Pappalopoulis reached over and stroked the flat cat 'Partnerships make quarrels,' he said thoughtfully.

'Have it your own way,' Castor answered. 'Five per cent for cash.

Pappalopoulis pulled out a roll that would have choked a medium-large Venerian sand hog. 'I buy 'em.'

The twins spent the afternoon exploring the city on foot and looking for presents for the rest of the family. When they started home their way led them back through the square between the receiving station and Poppa's restaurant The sign now read:

THE OLD SOUTHERN DINING ROOM
AND
TOURIST BUREAU
Sodas Souvenirs Candy
Sightseeing Trips
BICYCLES RENTED
Guide Service
See the Ancient Martian Ruins!!!

Pollux looked at it. 'He's a fast operator, all right. Maybe you should have insisted on a partnership.'

'Don't be greedy. We turned a profit, didn't we?'

'I told you we would. Well, let's get Fuzzy Britches home to Buster.'

XIII - CAVEAT VENDOR

Fuzzy Britches was not an immediate success with Lowell. 'Where its legs?' he said darkly. 'If it's a Martian, it ought to have three legs.'

'Well,' argued Castor, 'some Martians don't have legs.'

'Prove it!'

'This one doesn't That proves it'

Meade picked Fuzzy Britches up; it immediately began to buzz - whereupon Lowell demanded to hold it Meade passed it over. 'I don't see,' she remarked, 'why anything as helpless as that would have such bright colors.'

'Think again, honey lamb,' advised Hazel. 'Put that thing out on the desert sand and you would lose it at ten feet, Which might be a good idea.'

'No!' answered Lowell.

'"No" what, dear?'

'Don't you lose Fuzzy Britches. He's mine.' The child left carrying the flat cat and cooing a lullaby to it. Fuzzy Britches might lack legs but it knew how to win friends; anyone who picked it up hated to put it down. There was something intensely satisfying about petting the furry thing. Hazel tried to analyse it but could not.

No one knew when the quarantine of the *War God* would be lifted. Therefore Meade was much surprised one morning to return to Casa Mañana and fined her father in the general room. 'Daddy!' she yelled, swarring over him. 'When did you get down?.

'Just now.'

'Mummy, too?'

'Yes. She's in the 'fresher.'

Lowell stood in the doorway, watching them impassively. Roger Stone loosed himself from his daughter and said, 'Good morning, Buster.'

'Good morning, Daddy. This is Fuzzy Britches. He's a Martian. He's also a flat cat.'

'Glad to know you, Fuzzy Britches. Did you say "flat cat"?'

'Yes.'

'Very well. But it looks more like a wig.'

Dr Stone entered, was subjected to the same treatment by Meade, then turned to Lowell. He permitted her to kiss him, then said, 'Mama, this is Fuzzy Britches. Say hello to him.'

'How do you do, Fuzzy Britches? Meade, where are your brothers? And your grandmother?'

Meade looked upset. 'I was afraid you would get around to that. The twins are in jail again.'

Roger Stone groaned. 'Oh, no, not again! Edith, we should have stayed on Phobos.'

'Yes, dear.'

'Well, let's face it What is the charge this time, Meade?'

'Fraud and conspiring to evade the customs duties.'

'I feel better. The last time but one, you'll remember, it was experimenting with atomics inside the city limits and without license. But why aren't they out on bail? Or is there something worse you haven't told us?'

'No, it's just that the court has tied up their bank account and

Hazel wouldn't get them bond. She said they were safer where they were.'

'Good for Hazel!'

'Daddy, if we hurry we can get back downtown for the hearing. I'll tell you and Mummy about it on the way.'

The 'fraud' part of it came from Mr Pappalopoulis; the rest of it came straight from the planetary government. Mars, being in a state of expanding economy, just beginning to be self-supporting and only recently of declared sovereignty, had a strongly selective tariff. Being forced to import much and having comparatively little to export which could not be had cheaper Earthside, all her economic statutes and regulations were bent toward relieving her chronic credit gap; Articles not produced on Mars but needed for her economy came in duty free; articles of luxury or pleasure carried very high rates; articles manufactured on Mars were completely protected by embargo against outside competition.

Bicycles were classed by the Import Conimission as duty free since they were necessary to prospecting - but bicycles used for pleasure became 'luxury items'. The customs authorities had gotten around to noticing the final dlsposition of the cargo of the *Rolling Stone.* 'Of courss somebody put them up to it,' continued Meade, 'but Mr Angelo swears he didn't do it and I believe him. He's nice.'

'That's clear enough. What's the fraud angle?'

'Oh, that!' The bicycles had at once been impounded for unpaid duty penalties and costs whereupon their new owner had sworn an information charging fraud. 'He's getting a civil suit, too, but I think Hazel has it under control. Mr Poppa says he just wants his bicycles back; he's losing business. He's not mad at anybody.'

'I would be,' Roger Stone answered grimly. 'I intend to skin those two boys with a dull knife. What makes Hazel think she can square Mr Pappa-et-cetera? Just what, I'd like to know?'

'She got a temporary court order freeing the bicycles to Mr Poppa pending the outcome of the hearing; she had to put up a delivery bond on the bicycles. So Mr Poppa dropped the fraud matter and is waiting on the civil suit to see if he's hurt'

'Hmm - My bank account feels a little better anyway. Well, dear, we might as well go down and get it over with. There doesn't seem to be anything here that a long check book can't cover.'

'Yes, dear.'

'Remind me to buy a pair of Oregon boots on the way home. Meade, how much is this tariff?'

'Forty per cent.'

'Not too bad. They probably made more profit than that'

'But that's not all, Daddy. Forty per cent, plus another forty per cent penalty - plus confiscation of the bicycles.'

'Plus two weeks in pillory, I hope?'

'Don't do anything hasty, Daddy. Hazel is arguing the case.'

'Since when was she admitted to the bar?'

'I don't know, but it seems to be all right She got that court order.'

'Dear,' said Dr Stone, 'Shouldn't the boys have a regular lawyer? Your mother is a wonderful person, but she is sometimes just a bit impetuous.'

'If you mean she's as crazy as a skew orbit, I agree with you. But I'm betting on Hazel anyhow. We'll let her have her turn at the board. It probably won't cost me much more.'

'As you say, dear.'

They slipped into the back of the courtroom, which appeaed to be a church on some other days. Hazel was up front, talking to the judge. She saw them come in but did not appear to recognise them. The twins, looking very sober, were sitting together near the bench; they recogised their parents but took their cue from their grandmother.

'May it please the court,' said Hazel, 'I am a stranger here in a strange lans I am not skilled in your laws nor sophisticate in your customs. If I err, I pray the court to forgive me in advance and help me back to the proper path.'

The judge leaned back and looked at her. 'We were over all that earlier this morning.'

'Sure, judge, but it looks good in the record.'

'Do you expect to get me reversed?'

'Oh, no! We'll settle the whole thing right here and now, I'd guess.'

'I wouldn't venture to guess. I told you this morning that I would advise you as to the law, if need be. As to courtroom formalities, this Is a frontier. I can remember the time when, if one of us became involved in a misadventure which caused public disapproval, the matter was settled by calling a town meeting and taking a show of hands - and I've no doubt that as much justice was dispensed that way as any other. Times have changed but I don't think you will find this court much bothered by etiquette. Proceed.'

'Thanks, judge. This young fellow here - ' She hooked a thumb at the prosecutor's table. ' - would have you believe that my boys cooked up a nefarious scheme to swindle the citizens of this nation out of their rightful and lawful taxes. I deny that. Then he asks you to believe that, having hatched this Machiavellian plot, they carried it through and got away with it, until the hand of justice, slow but sure, descended on them and grabbed them. That's a pack of nonsense, too.'

'One moment I thought you stipulated this morning to the alleged facts?'

'I admitted that my boys didn't pay duty on those bikes. I didn't admit anything else. They didn't pay duty because nobody asked them to pay.'

'I see your point You'll have to lay a foundation for that and get it in by proper evidence later. I can see that this is going to be a little involved.'

'It needn't be, if we'll all tell the truth and shame the devil.' She paused and looked puzzled. 'Warburton . . . Warburton . . .' she said slowly, 'Your name is Warburton, Judge? Any kinfolk on Luna?'

The judge squared his shoulders. 'I'm a hereditary citizen of the Free State,' he said proudly. 'Oscar Warburton was my grandfather.'

'That's it!' agreed Hazel. 'It's been bothering me all morning but the numbers didn't click into place until I noticed your profile just now. I knew your, granddaddy well. I'm a Founding Father, too.'

'How's that? There weren't any Stones on the roster.'

'Hazel Meade Stone.'

'You're Hazel Meade? But you can't beyou must be dead!'

'Take another look, Judge. I'm Hazel Meade.'

'Well, by the breath of K'Raath! Excuse me, ma'am. We must get together when this is over.' He straightened up again. 'In the meantime I trust you realize that thism no way affects the case before us?'

'Oh, naturally not! But I must say it makes me feel better to know who's sitting on this case. Your granddaddy was a just man.'

'Thank you. And now shall we proceed?'

The young prosecutor was on his feet. 'May it please the court!'

'May what. please the court?'

'We feel that this is most irregular. We feel that under the circumstances the only proper procedure is for this court to disqualify itself. We feel -'

'Cut out that "we" stuff, Herbert You're neither an editor nor a potentate. Motion denied. You know as well as I do that Judge Bonelli is laid up sick. I don't propose to clutter up the calendar on the spurious - theory that I can't count fingers in front of my face.' He glanced at the clock. 'In fact, unless one of you has new facts to produce - facts, not theories - I'm going to assume that you have both stipulated to the same body of facts. Objection?'

'Okay with me, Judge.'

'No objection,' the prosecutor said wearily.

'You may continue, ma'am. I think we ought to wind this up in about ten minutes, if you both will stick to the subject. Let's have your theory.'

'Yes, your honor. First, I want you to take a look at those two young and innocent lads and see for yourself that they could not be up to anything criminal.' Castor and Pollux made a mighty effort to look the description; they were not notably successful.

Judge Warburton looked at them and scratched his chin. 'That's a conclusion, ma'am. I can't see any wings sprouting from here.'

'Forget it, then. They're a couple of little hellions, both of them. They've given me plenty of grief. But this time they didn't do anything wrong and they deserve a vote of thanks from your chamber of commerce - and from the citizens of Mars Cornmonwealth.

'The first part sounds plausible. The latter part is outside the jurisdiction of this court'

'You'll see. The key to this case is whether or not a bicycle is a production item, or a luxury. Right?'

'Correct And the distinction depends on the end use of the imported article. Our tariff schedule is flexible in that respect. Shall I cite the pertinent cases?'

'Oh, don't bother!'

Her son looked her over. 'Hazel, it occurs to me that the the end use of sightseeing, that the defendants knew that, that they even suggested that end use and made it part of their sales argument, and that they neglected to inform the buyer of the customs status of the articles in question. Correct?'

'Right to nine decimals, Judge.'

'I've not yet gotten a glimpse of your theory. Surely you are not contending that sightseeing is anything but a luxury?'

'Oh, it's a luxury all right!'

'Madam, it seems to me that you are doing your grandsons no good. If you will withdraw, I will appoint counsel.'

'Better ask them, Judge.'

'I intended to.' He looked inquiringly at the twins. 'Are you satisfied with your representation?'

Castor caught Pollux's eye, then answered promptly, 'We're as much in the dark as you are, sir - but we'll string along with grandmother.'

'I admire your courage at least Proceed, ma'am'

'We agreed that sightseeing is a luxury. But "luxury" is a relative term. Luxury for *whom?* Roast suckling pig is a luxury for you and me-'

'It certainly is. I haven't tasted one on this planet'

'- but it's an early death for the pig. Will the court take judicial notice of an activity known as "Mars" Invisible Export?"'

'The tourist trade? Certainly, if it's necessary to your theory.'

'Objection!'

'Just hang on to that objection, Herbert; she may not establish a connection. Proceed.'

'Let's find out who eats that pig. Your tariff rules, so it has been explained, are to keep citizens of the Commonwealth from wasting valuable foreign exchange on unnecessary frills. You've got a credit gap -'

'Regrettably, we have. We don't propose to increase it'

'That's my point Who pays the bill? Do *you* go sightseeing? Does he?' She pointed again at the prosecutor. 'Shucks, no! It's old stuff to both of you. But *1* do - I'm a tourist I rented one of those bicycles not a week ago - and helped close your credit gap. Your honor, we contend that the renting of bicycles to tourists, albeit a luxury to the tourist, is a productive activity for export to the unmixed benefit of every citizen of the Commonwealth and that therefore those bicycles are "articles of production" within the meaning and intent of your tariff laws!'

'Finished?' She nodded. 'Herbert?'

'Your honor, this is ridiculous! The prosecution has clearly established its case and the defense does not even dare to dispute it I have never heard a more outlandish mixture of special pleading and distortion of the facts. But I am sure the facts are clear to the court. The end use is sightseeing, which the defense agrees is a luxury. Now a luxury is a luxury -,

'Not to the pig, son.'

'."The pig?" What pig? There are no pigs in this case; there isn't a pig on Mars. If we -'

'Herbert! Have you anything to add?'

'I - ' The young prosecutor slumped. 'Sorry Dad, I got excited. We rest'

The judge turned to Hazel. 'He a good boy, but he's impetuous - like yours. I'll make a lawyer out of him yet.' He straightened up. 'And the court rests - ten minutes out for a pipe. Don't go away.' He ducked out

The twins whispered and fidgeted; Hazel caught the eyes of her son and daughter-in-law and gave them a solemn wink. Judge Warburton returned in less than ten minutes and the bailiff shouted for order. The judge stared at the prisoners. 'The court rules,' he said solemnly, 'that the bicycles in question are "articles of production" within the meaning of the tariff code. The prisoners are acquitted and discharged. The clerk will release the delivery bond.'

There was very scattered applause, led by Hazel. 'No demonstrations!' the judge said sharply. He looked again at the twins. 'You're extremely lucky - you know that' don't you?'

'Yessir!'

'Then get out of my sight and try to stay out of trouble.'

Dinner was a happy family reunion despite the slight cloud that still hung over the twins. It was also quite good, Dr Stone having quietly taken over the cooking. Captain Vandenbergh, down on the same shuttle, joined them for dinner. By disconnecting the TV receiver and placing it temporarily on Meade's bunk and by leaving open the door to the twins' cubicle so that Captain Vandenbergh's chair could be backed into the door frame, it was just possible for all of them to sit down at once. Fuzzy Britches sat in Lowell's lap; up till now the flat cat had had its own chair.

Roger Stone tried to push back his chair to make more room for his knees, found himself chock-a-block against the wall 'Edith, we will just have to get a larger place.'

'Yes, dear. Hazel and I spoke to the landlord this afternoon.'

'What did he say?'

Hazel took over. 'I'm going to cut his gizaard out I reminded him that he had promised to take care of us when you two got down. He looked saintly and pointed out that he had given us two more cots. Lowell, quit feeding that mop with your own spoon!'

'Yes, Grandma Hazel. May I borrow yours?'

'No. But he did say that we could have the flat the Burkhardts are in, come Venus depasture. It has one more cubicle.'

'Better,' agreed Roger Stone, 'but hardly a ballroom - and Venus departure is still three weeks away. Edith, we should have kept our nice room in the *War God.* How about it, Van? Want some house guests? Until you blast for Venus, that is?'

'Certainly.'

'Daddy! You wouldn't go away *again?'*

'I'm joking, snub nose.'

'I wasn't'' answered the liner's captain. 'Until Venus departure - or all the way to Venus and then back to Luna, if you choose. I got official approval of my recommendation this afternoon; you two can drag free in the *War God* until death or decommission do you past How about it? Come on to Venus with me?'

'We've been to Venus,' announced Meade. 'Gloomy place.'

'Whether they take you up or not,' Hazel commented, 'that's quite a concession to get out of Four-Planets. Ordinarily that bunch of highbinders wouldn't give away a bucketful of space.'

'They were afraid of the award an admiralty court might hand out' Vandenbergh said drily. 'Speaking of courts, I understand you put in a brilliant defense today, Hazel. Are you a lawyer, along with your other accomplishments?'

'No,' answered her son, 'but she's a fast talker.'

'Who's not a lawyer?'

'You aren't'

'of course I am!'

'When and where? Be specific.'

'Years and years ago, back in Idaho - before you were born. I just never got around to mentioning it'

Her son looked her over. 'Hazel, it occurs to me that the records in Idaho are conveniently far away.'

'None of your sass, boy. Anyway, the courthouse burned down.'

'I thought as much'

'In any case,' Vandenbergh put in soothingly, 'Hazel got the boys off. When I heard about it, I expected that they would have to pay the duty at least You young fellows must have made quite a tidy profit'

'We did all right' Castor admitted.

'Nothing spectacular,' Pollux hedged.

'Figure it up,' Hazel said happily, 'because I am going to collect a fee from you of exactly two-thirds your net profit for getting your necks out of a bight'

The twins stared at her. 'Hazel, you wouldn't?' Castor said uncertainly.

'Wouldn't I!'

'Don't tease them, Mother,' Dr Stone suggested.

'I'm not teasing. I want this to be a lesson to them. Boys, anybody who sits in a game without knowing the house rules is a sucker. Time you knew it'

Vandenbergh put in smoothly, 'It doesn't matter too much these days when the government -' He stopped suddenly. 'What in the world!'

'What's the matter, Van?' demanded Roger. Vandenbergh's face cleared and he grinned sheepishly. Nothing. Just your flat cat' crawling up my leg. For a moment I thought I had wandered into your television show.'

Roger Stone shook his head. 'Not mine, Hazel's. And it wouldn't have been a flat cat; it would have been human gore.'

Captain Vandenbergh picked up Fuzzy Britches, stroked it, then returned it to Lowell

'It's a Martian,' announced Lowell.'

'Yes?'

Hazel caught his attention. 'The situation has multifarious ramifications not immediately apparent to the unassisted optic. This immature zygote holds it as the ultimate desideratum to consort with the dominate aborigine of the trifurcate variety. Through a judicious use of benign mendacity, Exhibit "A" performs as a surrogate in spirit if not in letter. Do you dig me, boy?'

Vandenbergh blinked. 'I think so. Perhaps it's just as well. They are certainly engaging little pets - though I wouldn't have one in any ship of mine. They -'

'She means,' Lowell explained, 'that I want to see a Martian with legs. I still do. Do you know one?'

Hazel said, 'Coach, I tried, but they were too big for me.'

Captain Vandenbergh stared at Lowell. 'He's quite serious about it, isn't he?'

'I'm afraid he is'

He turned to Dr Stone. 'Ma'asn, I've fair connections around here and these things can always be arranged, in spite of treaties. Of course, there would be a certain element of danger - not much in my opinion.'

Dr Stone answered, Captain, I have never considered danger to be an evaluating factor.'

'Um, no, you wouldn't, ma'am. Shall I try it?'

'If you would be so kind.'

'It will pay interest on my debt. I'll let you know.' He dismissed the matter and turned again to the twins. 'What profit-tax classification does your enterprise come under?'

'Profit tax?'

'Haven't you figured it yet?'

'We didn't know there was one.'

'I can see you haven't done much importing and exporting, not on Mars anyhow. If you are a Commonwealth citizen, it all goes into income tax, of course. But if you come from out planet, you pay a single-shot tax on each transaction. Better find yourself a tax expert; the formula is somewhat complicated'

'We won't pay it!' said Pollux.

His father answered quietly, 'Haven't you two been in jail in enough lately?'

Pollux shut up. For the next few minutes they exchanged glances, whispers, and shrugs. Presently Castor stood up.

'Dad, Mother - may we be excused?'

'Certainly. If you can manage to squeeze out.'

'No dessert, boys?'

'We aren't very hungry.'

They went into town, to return an hour later not with a tax expert but with a tax guide they had picked up at the Chamber of Commerce. The adults were still seated in the general room, chatting; the table had been folded up to the ceiling. They threaded through the passageway of knees into their cubicle; they could be heard whispering in there from time to time.

Presently they came out. 'Excuse us, folks. Uh, Hazel?'

'What is it, Cas?'

'You said your fee was two-thirds of our net.'

'Huh? Did your leg come away in my hand, chum? I wouldn't -'

'Oh, no, we'd rather pay it.' He reached out, dropped half a dozen small coins in her hand 'There it is.'

She looked at it *'This is* two-thirds of all you made on the deal?'

'Of course,' added Pollux, 'it wasn't a total loss. We had the use of the bicycles for a couple of hundred million miles.'

XIV - FLAT CATS FACTORIAL

Vandenbergh made good his offer. Lowell and he went by stratorocket to the treaty town of Richardson, were gone about three days. When Lowell came back he had seen a Martian, he had talked with one. But he had been cautioned not to talk about it and his family could get no coherent account out of him.

But the simple matter of housing was more difficult than the presumably impossible problem of meeting a Martian. Roger Stone had had no luck in finding larger and more comfortable quarters, even after he had resigned himself to fantastic rentals. The town was bursting with tourists and would be until Venus departure, at which time those taking the triangular trip would leave - a majority, in fact. In the meantime they crowded the restaurants, took pictures of everything including each other, and ran their bicycles over the toes of pedestrians. Further packing a city already supersaturated were sand rats in from the desert and trying to arrange some way, any way, to get out to the Hallelujah Node in the Asteroid Belt.

Dr Stone said one night at dinner, 'Roger, tomorrow is rent day. Shall I pay it for a full month? Mr d'Avril says that the Burkhardts are talking about staying on.'

'Pay it for six days only,' Hazel advised. 'We can do better than this after Venus departure - I hope.'

Roger Stone looked up and scowled. 'Look here, why pay the rent at all?'

'What are you saying, dear?'

'Edith, I've been chewing this over in my mind. When we first came here our plans, such as they were, called for living here through one wait.' He referred to the fifteen months elapsed time from arrival Mars to Earth departure from Mars, using the economical orbits. Then we planned to shape orbit home. Fair enough, if this overrated tourist trap had decent housing. But I haven't been able to start writing my book. When Buster isn't climbing into my lap, his pet is slithering down the back of my neck.'

'What do you suggest, dear?'

'Go to Phobos tomorrow, get the old *Rock* ready to go, and blast for Venus when the others do.'

'Loud cheers!' agreed Meade. 'Let's go!'

Dr Stone said, 'Meade, I thought you didn't like Venus?'

'I don't. But I don't like it here and I'm tired all the time. I'd like to get back into free fall.'

'You shouldn't be tired. Perhaps I had better check you over.'

'Oh, Mother, I'm perfectly well! I don't want to be poked at' Lowell grinned. 'I know why she wants to go to Venus - Mr Magill.'

'Don't be a snoop, Snoop!' Meade went on with quiet dignity. 'In case anyone is interested, I am not interested in Second Officer Magill - and I wouldn't be going in the *Caravan* in any case. Besides, I found out he afready has a wife in Colorado.' Hazel said, 'Well, that's legal. He's still eligible off Earth,'

'Perhaps it is, but I don't like it.'

'Neither do I,' Roger Stone cut in. 'Meade, you weren't really getting interested in this wolf in sheep's clothing, were you?'

'Of course not, Daddy!' She added, 'But I suppose I'll get married one of these days.'

'That's the trouble with girls,' Castor commented. 'Give them educations - *boom!* They get married. Wasted.'

Hazel glared at them, 'Oh, so? Where would you be if I hadn't married?'

'It didn't happen that way,' Roger Stone cut in, 'so there is no use talking about other possibilities. They probably aren't really possibilities at all, if only we understood it'

Pollux: 'Predestination.'

Castor: 'Very shaky theory.'

Roger grinned. 'I'm not a determinist and you can't get my goat. I believe in free will.'

Pollux: 'Another very shaky theory.'

'Make up your minds,' their father told them. 'You can't have it both ways.'

'Why not?' asked Hazel. 'Free will is a golden thread running through the frozen matrix of fixed events.'

'Not mathematical,' objected Pollux.

Castor nodded. 'Just poetry.'

'And not very good poetry.'

'Shut up!' ordered their father. 'Boys, it's quite evident that you have gone to considerable trouble to change the subject. Why?'

The twins swapped glances; Castor got the go-ahead. 'Uh, Dad, the way we see it, this Venus proposition hasn't been thought out'

'Go on. I suppose you have an alternative suggestion?'

'Well, yes. But we didn't mean to bring it up until after Venus depauture.'

'I begin to whiff something. What you mean is that you intended to wait until the planetary aspects were wrong - too late to shape orbit for Venus.'

'Well, there was no use in letting the matter get cluttered up with a side issue.'

'What matter? Speak up.'

Castor said worriedly, 'Look, Dad, we aren't unreasonable. We can compromise. How about this: you and Mother and Buster and Meade go to Venus in the *War God.* Captain Van would love to have you do it - you know that. And -'

'Slow up. And what would you be doing? And Hazel? Mother, are you in on this?'

'Not that I know of. But I'm getting interested.'

'Castor, what's on your mind? Speak up.'

Well, I will if you'll just let me, sir. You and the rest of the family could have a pleasant trip back home - in a luxury liner. Hazel and Pol and I - well, I suppose you know that Mars will be in a favorable position for the Hallelujah Node in about six weeks?'

'For a cometary-type orbit, that is,' Pollux added.

'So it's the Asteroids again,' their father said slowly. 'We settled that about a year ago.'

'But we're a year older now.'

'More experienoed.'

'You're still not old enough for unlimited licenses. I suppose that is why you included your grandmother.'

'Oh,no! Hazel is an asset.'

'Thank you, boys.'

'Hazel, you had no inkling of this latest wild scheme?'

'No. But I don't think it's so wild. I'm caught up and then some on my episodes - and I'm tired of this place. I've seen the Martian ruins; they're in a poor state of repair. I've seen a canal; it has water in it. I understand that the rest of the planet is much the same, right through to chapter eighty-eight. And I've seen Venus. I've never seen the Asteroids.'

'Right!' agreed Castor. 'We don't like Mars. The place is one big clip joint'

'Sharp operators,' added Pollux.

'Sharper than you are, you mean,' said Hazel.

'Never mind, Mother. Boys, it is out of the question. I brought my ship out from Luna; I intend to take her back.' He stood up. 'You can give Mr d'Avril notice, dear.'

'Dad!"

'Yes, Castor?'

'That was just a compromise offer. What we really hoped you would do - what we *wanted* you to do - was for all of us to go out to the Hallelujah.'

'Eh? Why, that's silly! I'm no meteor miner.'

'You could learn to be. Or you could just go for the ride. And make a profit on it, too.'

'Yes? How?'

Castor wet his lips. 'The sand rats are offering fabulous prices just for coldsleep space. We could carry about twenty of them at least And we could put them down on Ceres on the way, let them outfit there'.

'Cas! I suppose you are aware that only seven out of ten coldsleep passengers arrive alive in a long orbit?'

'Well. . . they know that That's the risk they are taking.' Roger Stone shook his head. 'We aren't going, so I won't have to find out if you are as cold-blooded as you sound. Have you ever seen a burial in space?'

'No, sir'.'

'I have. Let's hear no more about coldsleep freight.'

Castor passed it to Pollux, who took over: 'Dad, if you won't listen to us all going, do you have any objections to Cas and me going?'

'Eh? How 'do you mean?'

'As Asteroid miners, of course. We're not afraid of coldsleep. If we haven't got a ship, that's how we would have to go.'

'Bravo!' said Hazel. 'I'm going with you, boys,'

'Please, Mother!' He turned to his wife. 'Edith, I sometimes wonder if we brought the right twins back from the hospital.'

'They may not be yours,' said Hazel, 'but they are my grandsons, I'm sure of that. Hallelujah, here I come! Anybody coming with me?'

Dr Stone said quietly, 'You know, dear, I don't much care for Venus, either. And it *would* give you leisure for your book'

The *Rolling Stone* shaped orbit from Phobos outward bound for the Asteroids six weeks later. This was no easy lift like the one from Luna to Mars; in choosing to take a 'cometary' or fast orbit to the Hallelujah the Stones had perforce to accept an expensive changeof-motion of twelve and a half miles per second for the departure maneuver. A fast orbit differs from a maximum-economy orbit in that it cuts the orbit being abandoned at an angle instead of being smoothly tangent to it. . . *much* more expensive in reaction mass. The far end of the cometary orbit would be tangent to the orbit of the Hallelujah; matching at that point would be about the same for either orbit; it was the departure from Phobos-circum-Mars that would be rugged.

The choice of a cometary orbit was not a frivolous one. In the first place, it would have been necessry to wait more than one Earth year for Mars to be in the proper relation, orbit-wise, with the Hallelujah Node for the economical orbit; secondly, the travel time itself would be more than doubled - five hundred and eighty days for the economical orbit versus two hundred and sixty-nine days for the cometary orbit (a mere three days longer than the Luna-Mars trip).

Auxiliary tanks for singleH were fitted around the *Stone's* middle, giving her a fat and sloppy appearance, but greatly improving her mass-ratio for the ordeal. Port Pilot Jason Thomas supervised the refitting; the twins helped. Castor got up his nerve to ask Thomas how he had managed to conn the *Stone* in to a landing on their arrival. 'Did you figure a ballistic before you came aboard, sir?'

Thomas put down his welding torch. 'A ballistic? Shucks, no, son, I've been doing it so long that I know every little bit of space hereabouts by its freckles.'

Which was all the satisfaction Cas could get out of him The twins talked it over and concluded that piloting must be something more than a mathematical science.

In addition to more space for singleH certain modifications were made inside the ship. The weather outside the orbit of Mars is a steady 'clear but cold'; no longer would they need reflecting foil against the Sun's rays. Instead one side of the ship was painted with carbon black and the capacity of the air-heating system was increased by two coils. In the control room a time-delay variable-baseline stereoscopic radar was installed by means of which they would be able to see the actual shape of the Hallelujah when they reached it.

All of which was extremely expensive and the Galactic Overlord had to work overtime to pay for it Hazel did not help with the refitting. She stayed in her room and ground out, with Lowell's critical help, more episodes in the gory but virtuous career of Captain John Sterling - alternating this activity with sending insulting messages and threats of blackmail and/or sit-down strike to her producers back in New York; she wanted an unreasonably large advance and she wanted it right now. She got it, by sending on episodes equal to the advance. She had to write the episodes in advance anyhow; this time the *Rolling Stone* would be alone, no liners comfortably near by. Once out of radio range of Mars, they would not be able to contact Earth again until Ceres was in range of the *Stone's m*odest equipment. They were not going to Ceres but would be not far away; the Hallelujah was riding almost the same orbit somewhat ahead of that tiny planet.

The boost to a cometary orbit left little margin for cargo but what there was the twins wanted to use, undeterred by their father's blunt disapproval of the passengers-in-coldsleep idea. Their next notion was to carry full outfits for themselves for meteor mining - rocket scooter, special suits, emergency shelter, keyed radioactive claiming stakes, centrifuge speegee tester, black lights, Geiger counters, prospecting radar, portable spark spectroscope, and everything else needed to go quietly rock-happy.

Their father said simply, 'Your money?'

'Of course. And we pay for the boost.'

'Go ahead. Go right ahead. Don't let me discourage you. Any objections from me would simply confirm your preconceptions.'

Castor was baffled by the lack of opposition. 'What's the matter with it, Dad? You worried about the danger involved?'

'Danger? Heavens, no! It's your privilege to get yourselves killed in your own way. Anyhow, I don't think you will. You're young and you're both smart, even if you don't show it sometimes, and you're both in tiptop physical condition, and I'm sure you'll know your equipment.'

'Then what is it?'

'Nothing. For myself, I long since came to the firm conclusion that a man can do more productive work, and make more money if this is his object, by sitting down with his hands in his pockets than by any form of physical activity. Do you happen to know the average yearly income of a meteor miner?'

'Well, no, but -'

'Less than six hundred a year.'

'But some of them get rich!'

'Sure they do. And some make much less than six hundred a year; that's an average, including the rich strikes. Just as a matter of curiosity, bearing in mind that most of those miners are experienced and able, what is it that you two expect to bring to this trade that will enable you to raise the yearly average? Speak up; don't be shy.'

'Doggone it, Dad, what would *you* ship?'

'Me? Nothing. I have no talent for trade. I'm going out for the ride - and to take a look at the bones of Lucifer. I'm beginning to get interested in planetology. I may do a book about it-'

'What happened to your other book?'

'I hope that isn't sarcasm, Cas. I expect to have it finished before we get there.' He adjourned the discussion by leaving.

The twins turned to leave, found Hazel griamng at them. Castor scowled at her. 'What are you smirking at, Hazel?'

'You two.'

'Well. . . why shouldn't we have a whirl at meteor mining?'

'No reason. Go ahead; you can afford the luxury. But see here, boys, do you really want to know what to ship to make some money?'

'Sure!'

'What's your offer?'

'Percentage cut? Or flat fee? But we don't pay if we don't take your advice.'

'Oh, rats! I'll give it to you free. If you get advice free, you won't take it and I'll be able to say, "I told you so!"'

'You would, too.'

'Of course I would. There's no warmer pleasure than being able to tell a smart aleck, "I told you so, but you wouldn't listen." Okay, here it is, in the form of a question, just like an oracle: Who made money in all the other big mining rushes of history?'

'Why, the chaps who struck it rich, I' suppose.'

'That's a laugh. There are so few cases of prospectors who actually hung on to what they had found and died rich that they stand out like supernovae. Let's take a famous rush, the California Gold Rush back in 1861-no, 1861 was something else; I forget. 1849, that was it - the 'Forty-niners. Read about 'em in history?'

'Some.'

'There was a citizen named Sutter; they found gold on his place. Did it make him rich? It *ruined* him. But who did get rich?'

'Tell us, Hazel. Don't bother to dramatise it'

'Why not? I may put it in the show - serial numbers rubbed off, of course. I'll tell you: everybody who had something the miners had to buy. Grocers, mostly. Boy, did *they* get rich! Hardware dealers. Men with stamping mills, Everybody but the poor miner. Even laundries in Honolulu.'

'Honolulu? But that's way out in the Pacific, off China somewhere.'

'It was in Hawaii the last time I looked. But they used to ship dirty laundry from California clear to Honolulu to have it washed - both Ways by sailing ship. That's about like having your dirty shirts shipped from Marsport to Luna. Boys, if you want to make money, set up a laundry in the Hallelujah. But it doesn't have to be a laundry - just anything, so long as the miners want it and you've got it If your father wasn't a Puritan at heart, I'd set up a well-run perfectly honest gambling hall! That's like having a rich uncle.'

The twins considered their grandmother's advice and went into the grocery business, with a few general store sidelines. They decided to stock only luxury foods, things that the miners would not be likely to have and which would bring highest prices per pound. They stocked antibiotics and surgical drugs and vitamins as well, and some lightweight song-and-story projectors and a considerable quantity of spools to go with them. Pollux found a supply of pretty-girl pictures, printed on thin stock in Japan and intended for calendars on Mars, and decided to take a flyer on them, since they didn't weigh much. He pointed out to Castor that they could not lose entirely, since they could look at them themselves.

Dr Stone found them, ran through them, and required him to send some of them back. The rest passed her censorship; they took them along.

The last episode was speeding toward Earth; the last weld had been approved; the last pound of food and supplies was at last aboard.

The *Stone* lifted gently from Phobos and dropped toward Mars. A short gravity-well maneuver around Mars at the *Stone's* best throat temperature - which produced a spine-grinding five gravities - and she was headed out and fast to the lonely reaches of space inhabited only by the wreckage of the Ruined Planet.

They fell easily and happily back into free fall routine. More advanced mathematical texts had been obtained for the boys on Mars; they did not have to be urged to study, having grown really interested - and this time they had no bicycles to divert their minds. Fuzzy Britches took to free fall if the creature had been born in space; if it was not being held and stroked by someone (which it usually was) it slithered over wall and bulkhead, or floated gently around the compartments, undulating happily.

Castor maintained that it could swim through the air; Pollux insisted that it could not and that its maneuvers arose entirely from the air currents of the ventilation system, They wasted considerable time, thought, and energy in trying to devise scientific tests to prove the matter, one way or the other. They were unsuccessful.

The flat cat did not care; it was warm, it was well fed, it was happy. It had numerous friends all willing to take time off to reward its tremendous and undiscriminating capacity for affection. Only one incident marred its voyage.

Roger Stone was strapped to his pilot's chair, blocking out - so he said - a chapter in his book. If so, the snores may have helped. Fuzzy Britches was cruising along about its lawful occasions, all three eyes open and merry. It saw one of its friends; good maneuvering or a random air current enabled it to make a perfect landing - on Captain Stone's face.

Roger came out of the chair with a yell, clutching at his face. He bounced against the safety belt, recovered, and pitched the flat cat away from him. Fuzzy Britches, offended but not hurt, flipped itself flat to its progress, air-checked and made another landing on the far wall.

Roger Stone used several other words, then shouted, 'Who put that animated toupee on my face?'

But the room was otherwise empty. Dr Stone appeared at the hatch and said, 'What is it, dear?'

'Oh, nothing - nothing important. Look, dear, would you return this tailend offspring of a dying planet to Buster? I'm trying to think.'

'Of course, dear.' She took it aft and gave it to Lowell, who promptly forgot it, being busy working out a complicated gambit against Hazel. The flat cat was not one to hold a grudge; there was not a mean bone in its body, had it had bones, which it did not The only emotion it could feel wholeheartedly was love. It got back to Roger just as he had. again fallen asleep.

It again settled on his face, purring happily.

Captain Stone proved himself a mature man. Knowing this time what it was,.he detached it gently and himself returned it to Lowell. 'Keep it,' he said. 'Don't let go of it' He was careful to close the door behind him.

He was equally careful that nlght to close the door of the stateroom he shared with his wife. The *Rolling Stone,* being a small private ship, did not have screens guarding her ventilation ducts; they of course had to be left open at all times. The flat cat found them a broad highway. Roger Stone had a nightmare in which he was saffocating, before his wife woke him and removed Fuzzy Britches from his face. He used some more words.

'It's all right, dear,' she answered soothingly. 'Go back to sleep.' She cuddled it in her arms and Fuzzy Britches settled for that.

The ship's normal routine was disturbed the next day while everyone who could handle a wrench or a spot welder installed screens in the ducts.

Thirty-seven days out Fuzzy Britches had eight golden little kittens, exactly like their parent but only a couple of inches across when flat, marble-sized when contracted. Everyone, including Captain Stone thought they were cute; everyone enjoying petting them, stroking them with a gentle forefinger and listening carefully for the tiny purr, so high as to be almost beyond human ear range. Everyone enjoyed feeding them and they seemed to be hungry all the time.

Sixty-four days later the kittens had kittens, eight each. Sixty-four days after that, the one hundred and forty-sixth day after Phobos departure, the kittens' kittens had kittens; that made five hundred and thirteen.

'This,' said Captain Stone, 'has *got* to stop!'

'Yes, dear.'

'I mean it At this rate we'll run out of food before we get there, including the stuff the twins hope to sell. Besides that we'll be suffocated under a mass of buzzing fur mats. What's eight times five hundred and twelve? Then what's eight times *that?'*

'Too many, I'm sure.'

'My dear, that's the most masterly understatement since the death of Mercutio. And I don't think I've figured it properly anyway; its an exponential expansion, not a geometric - provided we don't all starve first'

'Roger.'

'I think we should-Eh? What?'

'I believe there is a simple solution. These are Martian creatures; they hibernate in cold weather.'

'Yes?'

'We'll put them in the hold - fortunately there is room.'

'I agree with all but the "fortunately."'

'And we'll keep it cold.'

'I wouldn't want to kill the little things. I can't manage to hate them. Drat it' they're too cute.'

'We'll hold it about a hundred below, about like a normal Martian winter night. Or perhaps warmer will do.'

'We certainly will. Get a shovel. Get a net Get a barrel.' He began snagging flat cats out of the air.

'You aren't going to freeze Fuzzy Britches!' Lowell was floating in the stateroom door behind them, clutching an adult flat cat to his small chest. It may or may not have been Fuzzy Britches; none of the others could tell the adults apart and nasning had been dropped after the first litter. But Lowell was quite sure and it did not seem to matter whether or not he was right The twins had discussed slipping in a ringer on him while he was asleep, but they had been overheard and the project forbidden. Lowell was content and his mother did not wish him disturbed in his belief.

'Dear, we aren't going to hurt your pet'

'You better not! You do and I'll - I'll *space* you!'

'Oh, dear, he's been helping Hazel with her serial!' Dr Stone got face to face with her son. 'Lowell, Mother has never lied to you, has she?'

'Uh, I guess not'

'We aren't going to hurt Fuzzy Britches. We aren't going to hurt any of the flat kitties. But we haven't got room for all of them. You can keep Fuzzy Britches, but the other kittens, are going for a long nap. They'll be perfectly safe; I promise.

'By the code of the Galaxy?'

'By the code of the Galaxy.'

Lowell left, still guarding his pet. Roger said, 'Edith, we've got to put a stop to that collaboration.'

'Don't worry dear; it won't harm him.' She frowned. 'But I'm afraid I will have to disappoint him on another score.'

'Such as?'

'Roger, I didn't have much time to study the fauna of Mars - and I certainly didn't study flat cats, beyond making sure that they were harmless.'

'Harmless!' He batted a couple of them out of the way. 'Woman, I'm drowning.'

'But Martian fauna have certain definite patterns, survival adaptations. Except for the waterseekers, which probab,ly aren't Martian in origin anyhow, their methods are both passive and persistent. Take the flat cat-'

'You take it!' He removed one gently from his chest.

'It is defenseless. It can't even seek its own food very well. I understand that in its native state it is a benign parasite attaching itself to some more mobile animal-'

'If only they would quit attaching to me! And you look as if you were wearing *a fur* coat Let's put 'em in *freeze!*'

'Patience, dear. Probably it has somewhat the same pleasing effect on the host that it has on us; consequently the host tolerates it and lets it pick up the crumbs. But its other characteristic it shares with almost anything Martian. It can last long periods in hibernation, or if that isn't necessary, in a state of lowered vitality and activity - say when there is no food available. But with any increase in the food supply, then at once - almost like throwing a switch - it expands, multiplies to the full extent of the food 'supply.'

'I'll say it does!'

'Cut off the food supply and it simply waits for more good times. Pure theory, of course, since I am reasoning by analogy from other Martian life forms - but that's why I'm going to have to disappoint Lowell - Fuzzy Britches will have to go on very short rations.'

Her husband frowned. 'That won't be easy; he feeds it all the time. We'll just have to watch him - or there will be more little visitors from heaven. Honey, let's get busy. Right now.'

'Yes, dear. I just had to get my thoughts straight'

Roger called them all to general quarters; Operation Roundup began. They shooed them aft and into the hold; they slithered back, purring and seeking companionship. Pollux got into the hold and tried to keep them herded together while the others scavenged through the ship. His father stuck his head in; tried to make out his son in a cloud of flat cats; 'How many have you got so far?'

'I can't count them - they keep moving around. Close the door!'

'How can I keep the door closed and still send them in to you?'

'How can I keep them in here if you keep opening the door?' Finally they all got into space suits - Lowell insisted on taking Fuzzy Britches inside with him, apparently not trusting even 'the code of the Galaxy' too far. Captain Stone reduced the temperature of the entire ship down to a chilly twenty below; the flat cats, frustrated by the space suits and left on their own resources, gave up and began forming themselves into balls, like fur-covered grape fruit. They were then easy to gather in, easy to count, easy to store in the hold.

Nevertheless the Stones kept finding and incarcerating fugitives for the next several days.

XV - 'INTER JOVEM ET MARTEM PLANETAM INTERPOSUI'

The great astronomer Kepler wrote: 'Between Mars and Jupiter I put a planet.' His successors devised a rule for planetary distances, called 'Bode's Law', which seemed to require a planet at precisely two and eight/tenths the distance from Sun to Earth, 2.8 astro units.

On the first night of the new nineteenth century the Monk Giuseppe Piazzi discovered a new heavenly body. It was the Asteroid Ceres - just where a planet should have been. It was large for an Asteroid, the largest in fact - diameter 485 miles. In the ensuing two centuries hundreds and thousands more were discovered, down to size of rocks. 'The Asteroids' proved a poor name; they were not little stars, nor were they precisely planetoids. It was early suggested that they were the remains of a once sizable planet and by the middle of the twentieth century mathematical investigation of their orbits seemed to prove it.

But it was not until the first men in the early days of the exploration of space actually went out to the lonely reaches between the orbits of Mars and Jupiter and *looked* that we learned for certain that the Asteroids were indeed fragments of a greater planet - destroyed Lucifer, long dead brother of Earth.

As the *Rolling Stone* rose higher and ever higher above the Sun, she slowed, curved her path in, and approached the point where she would start to fall back toward the Sun. She was then at the orbit of Ceres and not far in front of that lady. The *Stone* had been in the region of the Asteroids for the past fifty million miles. The ruins of Lucifer are scattered over a wide belt of space; the Hallelujah Node was near the middle of that belt.

The loose group of rocks, sand, random molecules, and microplanetoids known as the Hallelujah Node was travelling in company around the Sun at a speed of eleven miles per second. The *Stone's* vector was eight miles per, second and in the same direction. Captain Stone speeded up his ship to match in by a series of blasts during the last two days, coming by a radar beacon deep in the swarm and thereby sneaking up on the collection of floating masses at a low relative speed.

The final blast that positioned them dead with the swarm was a mere love tap; the *Stone* did clear her throat - and she was one with the other rolling space stones of space.

Captain Stone took a last look into the double eyepiece of the stereo radar, swung the sweep control fore and aft and all around; the masses of the Hallelujah, indistinguishable from the background of stars by naked eye, hung in greatly exaggerated perspective in the false 'space' of the stereo tank while the true stars showed not at all. None of them displayed the crawling trail of relative motion.

A point brighter than the rest glowed in a fluctuating pattern fairly close by and a few degrees out-orbit; it was the radar beacon on which he had homed. It too, seemed steady by stereo; he turned to Castor and said, 'Take a doppler on City Hall.'

'Just getting it, Captain.' In a moment he added, 'Uh, relative about ten miles an hour - nine point seven and a whisper. And just under seven hundred miles away.'

'Vector?'

'Closing almost for it We ought to slide past maybe ten, fifteen miles south and in-orbit'

Roger Stone relaxed and grinned. 'How's that for shooting? Your old man can still figure them, eh?'

'Pretty good, Dad - considering.'

'Considering what?'

'Considering you used Pol's figures.'

'When I figure out which one of us you are insulting, I'll answer that.' He spoke to the mike: 'All hands, secure from maneuvers. Power room, report when secure. Edith, how soon can we have dinner?'

'It's wrapped up, son,' Hazel reported.

'About thirty minutes, dear,' his wife answered.

'A fine thing! A man slaves over a hot control board and then has to wait thirty minutes for his dinner. What kind of a hotel is this?'

'Yes, dear. By the way, I'm cutting your calorie ration again.'

'Mutiny! What would John Sterling do?'

'Daddy's getting fat! Daddy's getting fat!' Lowell chanted. 'And strangle your child. Anybody want to come out with me while I set jato units?'

'I will, Daddy!'

'Meade, you're just trying to get out of helping with dinner.'

'I can spare her, dear.'

'Spare the child and spoil the fodder. Come with your fodder, baby.'

'Not very funny, Daddy.'

'And I'm not getting paid for it, either.' Captain Stone went aft, whistling. The twins as well as Meade went out with him; they made quick work of setting jato units, the young people locking them in place and the Captain seeing to the wiring personally. They set a belt of them around the waist of the ship and matched pairs on the bow and quarter. Wired for triggering to the piloting radar, set at minimum range, they would give the ship a sharp nudge in the unlikely event that any object came toward them on a collision course at a relative speed high enough to be dangerous.

Coming through the Asteroid Belt to their present location deep in it, they had simply taken their chances. Although one is inclined to think of the Belt as thick with sky junk, the statistical truth is that there is so enormously more space than rock that the chance of being hit is negligible. Inside a node the situation was somewhat different, the concentration of mass being several hundred times as great as in the ordinary reaches of the Belt. But most of the miners took no precautions even there, preferring to bet that this unending game of Russian roulette would always work out in their favor rather than go to the expense and trouble of setting up a meteor guard. This used up a few miners, but not often; the accident rate in Hallelujah node was about the same as that of Mexico City.

They went inside and found dinner ready. 'Call for you, Captain.' announced Hazel.

'Already?'

'City Hall. Told 'em you were out but would call back. Nine point six centimeters.'

'Come eat your dinner, dear, while it's hot'

'You all go ahead. I won't be long.'

Nor was he. Dr Stone looked inquiringly at him as he joined them. 'The Mayor,' he told her and the others. 'Welcome to Rock City and all that sort of thing. Advised me that the Citizen's Committee has set a speed limit of a hundred miles an hour for ships, five hundred miles an hour for scooters, anywhere within a thousand miles of City Hall.'

Hazel bristled. 'I suppose you told him what they could do with their speed limits?'

'I did not I apologized sweetly for having unwittingly offended on my approach and said that I would be over to pay my respects tomorrow or the next day.'

'I thought Mars would have some elbow room,' Hazel grumbled. 'It turned out to be nothing but scissorbills and pantywaists and tax collectors. So we come on out to the wide open spaces and what do we find? Traffic cops! And my only son without the spunk to talk back to them. I think I'll go to Saturn.'

'I hear that Titan Base is awfully chilly,' her son answered without rancor. ''Why not Jupiter? Pol, flip the salt over this way, please.'

'Jupiter? The position isn't favorable. Besides I hear that, Ganymede has more regulations than a girls' school.'

'Mother, you are the only juvenile delinquent old enough for a geriatrics clinic whom I have ever known. You know perfectly well that an artificial colony has to have regulations.'

'An excuse for miniature Napoleons! This whole system has taken to wearing corsets.'

'What's a corset?' inquired Lowell.

'Uh . . . a predecessor to the spacesuit, sort of.'

Lowell still looked puzzled; his mother said, 'Never mind, dear. When we get back, Mother will show you one, in the museum.'

Captain Stone proposed that they all turn in right after supper; they had all run short on sleep during the maneuvering approach. 'I keep seeing spots before my eyes,' he said, rubbing them, 'from staring into the tank. I think I'll sleep the clock around.'

Hazel started to answer when an alarm shrilled; he passed instantly from sleepy to alert. 'Object on collision course! Grab something, everybody.' He clutched at a stanchion with one hand, gathered in Lowell with the other.

But no shove from a firing jato followed. 'Green,' Hazel announced quietly. 'Whatever it is, it isn't moving fast enough to hurt us. Chances favor a near miss, anyway.'

Captain Stone took a deep breath, 'I hope you're right, but I've been on the short end of too many long shots to place much faith in statistics. I've been jumpy ever since we entered the Belt'

Meade went aft with dirty dishes. She returned in a hurry, round eyed. 'Daddy - somebody's at the *door.'*

'What? Meade, you're imagining things.'

'No, I'm not I *heard* him. Listen.'

'Quiet, everyone.' In the silence they could hear the steady hiss of an air injector; the lock was cycling. Roger Stone lunged toward the airlock; he was stopped by a sharp warning from his mother. 'Son! Hold it a second'

'What?'

'Keep back from that door.' She had her gun out and at the ready.

'Huh? Don't be silly. And put that thing away; it isn't charged anyhow.'

'He won't know that. Whoever is coming in that lock.'

Dr Stone said quietly, 'Mother Hazel, what are you nervous about?'

'Can't you see? We've got a ship here with food in it. And oxy. And a certain amount of singleH. This isn't Luna City; there are men out here who would be tempted.'

Dr Stone did not answer but turned to her husband. He hesitated only momentarily, then snapped, 'Go forward, dear. Take Lowell. Meade, you go along and lock the access hatch. Leave the ship's phones open. If you hear anything wrong, radio City Hall and tell them we are being hijacked. Move!' He was already ducking into his stateroom, came out with his own gun.

By the time the hatch to the control room had clanged shut the airlock finished cycling. The four remaining waited, surrounding the airlock inner door. 'Shall we jump him, Dad?' Castor whispered.

'No just stay out of my line of ifre.'

Slowly the door swung open. A spacesuited figure crouched in the frame, its features indistinct in its helmet. It looked around, saw the guns trained on it, and spread both its hands open in front of it. 'What's the matter?' a muffled voice said plaintively. 'I haven't done anything.'

Captain Stone could see that the man, besides being empty-handed, carried no gun at his belt. He put his own away. 'Sorry. Let me give you a hand with that helmet'

The helmet revealed a middle-aged, sandy-haired man with mild eyes. 'What was the matter?' he repeated.

'Nothing. Nothing at all. We didn't know who was boarding us and we were a bit nervous. My name's Stone, by the way. I'm master.'

'Glad to know you, Captain Stone. I'm Shorty Devine.'

'I'm glad to know you, Mr Devine. Welcome aboard.'

'Just Shorty.' He looked around. 'Uh, excuse me for bursting in on you and scaring you but I heard you had a doctor aboard. A real doctor, I mean - not one of those science johnnies.'

'We have.'

'Gee, that's wonderful! The town hasn't had a real doctor since old Doc Schultz died. And I need one, bad.'

'Sorry! Pol, get your mother.'

'I heard, dear', the speaker horn answered. 'Coming.' The hatch opened and Dr Stone came in. 'I'm the doctor, Mr Devine. Dear, I'll use this room, I think. If you will all go somewhere else, please?'

The visitor said hastily, 'Oh, they needn't'

'I prefer to make examinations without an audience,' she said firmly.

'But I didn't explain, ma'am - Doctor. It isn't me; it's my partner.'

'Oh?'

'He broke his leg. Got careless with two big pieces of core material and got his leg nipped between 'em. Broke it. I guess I didn't do too well by him for he's a powerfully sick man. Could you come over right away, Doctor?'

'Certainly.'

'Now, Edith!'

'Castor, get my surgical kit - the black one. Will you help me suit up, dear?'

'But Edith, you -'

'It's all right, Captain; I've got my scooter right outside. We're only eight-five, ninety miles away; we won't be gone long.'

Captain Stone sighed. 'I'm going with you. Will your scooter take three?'

'Sure, sure! It's got Reynolds saddles; set any balance you need.'

'Take command, Hazel'

'Aye aye, sir!'

They were gone all night, ship's time, rather than a short while. Hazel sat at the control board, tracking them all the way out - then watched and waited until she spotted them leaving, and tracked them back. Devine, profuse with tannks, had breakfast with them. Just before he left Lowell came into the saloon earrying Fuzzy Britches. Devine stopped with a bite on the way to his mouth and stared. 'A flat cat! Or am I seeing things?'

'Of course it is. Its name is Fuzzy Britches. It's a Martian.'

'You bet it is! Say, do you mind if I pet her for a moment?'

Lowell looked him over suspiciously, granted the boon. The prospector held it like one who knows flat cats, cooed to it, and stroked it. 'Now ain't that nice! Almost makes me wish I had never left Mars - not but what its better here.' He handed it back reluctantly, thanked them all around again, and left

Dr Stone flexed her fingers. 'That's the first time I've done surgery in free fall since the old clinic days. I must review my techniques.'

'My dear, you were magnificent. And Jock Donaher is mighty lucky that you were near by.'

'Was he pretty bad, Mummy?' asked Meade.

'Quite,' answered her father. 'You wouldn't enjoy the details. But your Mother knew what to do and did it And I was a pretty fair scrub nurse myself, if I do say so as shouldn't.'

'You do say so and shouldn't,' agreed Hazel.

'Roger', asked Dr Stone, 'that thing they were living in could it be operated as a ship?'

'I doubt it, not the way they've got it rigged now. I wouldn't call it a ship; I'd call it a raft'

'What do they do when they want to leave?'

'They probably don't want to leave. They'll probably die within hailing distance of Rock City - as Jock nearly did. I suppose they sell their high grade at Ceres, by scooter - circum Ceres, that is. Or maybe the sell it here.'

'But the whole town is migratory. They have to move sometime.'

'Oh, I imagine you could move that hulk with a few jato units, if you were gentle about it and weren't in any hurry. I think I'd decompress it before I tried it, though.'

XVI - ROCK CITY

The Asteroid Belt is a flattened torus ring or doughnut in space encompassing thirteen thousand five hundred thousand million trillion cubic miles. This very conservative figure is arrived at by casting out of the family the vagrant blacksheep who wander in down to Mars and farther - even down close, to Sun itself - and by ignoring those which strayed too far out and became slaves to mighty Jove, such as the Trojan Asteroids which make him a guard of honor sixty degrees ahead and behind him, in orbit. Even those that swing too far north or south are excluded; an arbitrary limit of six degrees deviation from ecliptic has been assumed.

13,500,000,000,000,000,000,000,000 cubic miles of space.

Yet the entire human race could be tucked into one corner of a single cubic mile; the average human body is about two cubic feet in bulk.

Even Hazel's dauntless hero 'Captain John Sterling' would he hard put to police such a beat. He would need to be twins, at least.

Write the figure as 1.35 x $10^{25\text{th}}$ cubic miles; that makes it easier to see if no easier to grasp. At the time the *Rolling Stone* arrived among the rolling stones of Rock City the Belt had a population density of one human soul for every two billion trillion cubic miles - read 2 x 10^{21}. About half of these six thousand-odd lived on the larger planetoids. Ceres, Pallas, Vesta, Juno; one of the few pleasant surprises in the exploration of our system was the discovery that the largest Asteroids were unbelievably dense and thus had respectable surface gravitations. Ceres, with a diameter of only 485 miles, has an average density five times that of Earth and a surface gravity about the same as Mars. These large planetoids are believed to be mainly core material of lost Lucifer, covered with a few miles of lighter debris.

The other three thousand inhabitants constitute the Belt's floating population in a most literal sense; they live and work in free fall. Almost all of them are gathered into half a dozen loose communities working the nodes or clusters of the Belt. The nodes are several hundred times as dense as the main body of the Belt - if 'dense' is the proper word; a transport for Ganymede could have ploughed through the Hallelujah node and Rock City and never noticed it except by radar. The chance that such a liner would hit anything is extremely small.

The miners worked the nodes for uranium, transuranics, and core material, selling their high grade at the most conveniently positioned large Asteroid and occasionally moving on to some other node. Before the strike in the Hallelujah the group calling themselves Rock City had been working Kaiser Wilhelm node behind Ceres in orbit; at the good news they moved, speeding up a trifle and passing in-orbit of Ceres, a ragtag caravan nudged through the sky by scooters, chemical rocket engines, jato units, and faith. Theirs was the only community well placed to migrate. Grogan's Boys were in the same orbit but in Heartbreak node beyond the Sun, half a billion miles away. New Joburg was not far away but was working the node known as Reynolds Number Two, which rode the Themis orbital pattern, inconveniently far out.

None of these cities in the sky was truly self-supporting, nor perhaps ever would be; but the ravenous appetite of Earth's industries for power metal and for the even more valuable planetary-core materials for such uses as jet throats and radiation shields - this insatiable demand for what the Asteroids could yield - made certain that the miners could swap what they had for what they needed Yet in many ways they were almost self-supporting; uranium refined no further away than Ceres gave them heat and light and power; all of their vegetables and much of their protein came from their own hydroponic tanks and yeast vats, SingleH and oxygen came from Ceres or Pallas.

Wherever there is power and mass to manipulate, Man can live.

For almost three days, the *Rolling Stone* coasted slowly through Rock City. To the naked eye looking out a port or even to a person standing outside on the hull Rock City looked like any other stretch of space - empty, with a backdrop of stars. A sharp-eyed person who knew the constellations well would have noticed far too many planets distorting the classic configurations, planets which did not limit their wanderings to the Zodiac. Still sharper attention would have spotted motion on the part of these 'planets', causing them to open out and draw aft from the direction the *Stone* was heading.

Just before lunch on the third day Captain Stone slowed his ship still more and corrected her vector by firing a jato unit; City Hall and several other shapes could be seen ahead. Later in the afternoon he fired one more jato unit, leaving the *Stone* dead in space relative to City Hall and less than an eighth of a mile from it He turned to the phone and called the Mayor.

'Rolling Stone, Luna, Captain Stone speaking.'

'We've been watching you come in, Captain,' came the voice of the Mayor.

'Good. Mr Fries, I'm going to try to get a line over to you. With luck. I'll be over to see you in a half-hour or so.'

'Using a line-throwing gun? I'll send someone out to pick it up.'

'No gun, worse luck. With the best of intentions I forgot to stock one.'

Fries hesitated. 'Uh, Captain, pardon me, but are you in good practice for free-fall suit work?'

'Truthfully, no.'

'Then let me send a boy across to put a line on you. No, no! I insist'

Hazel, the Captain, and the twins suited up, went outside, and waited. They could make out a small figure on the ship across from them; the ship itself looked larger now, larger than the *Stone.* City Hall was an obsolete space-to-space vessel, globular, and perhaps thirty years old. Roger Stone surmised correctly that she had made a one-way freighter trip after she was retired from a regular run.

In close company with City Hall was a stubby cylinder; it was either smaller than the spherical ship or farther away. Near it was an irregular mass impossible to make out; the sunlight on it was bright enough but the unfilled black shadows gave no clear clues. All around them were other ships or shapes close enough to be distinguished from the stars; Pollux estimated that there must be two dozen within as many miles. While he watched a scooter left a ship a mile or more away and headed toward City Hall.

The figure they had seen launched himself across the gap. He seemed to swell; in half a minute he was close by, checking himself by the line he carried. He dropped to an easy landing near the bow of the *Stone;* they went to meet him.

'Howdy, Captain. I'm Don Whitsitt, Mr. Fries' bookkeeper.'

'Howdy, Don.' He introduced the others; the twins helped haul in the light messenger line and coil it; it was followed by a steel line which Don Whitsitt shackled to the ship.

'See you at the store,' he said. 'So long.' He launched himself back the way he came, carrying the coiled messenger line and not bothering with the line he had rigged.

Pollux watched him draw away. 'I think I could do that'

'Just keep on thinking it', his father said, 'and loop yourself to that guide line.'

One leap took them easily across the abyss, provided one did not let one's loop twist around the guide line. Castor's loop did so; it braked him to a stop. He had to unsnarl it, then gain momentum again by swarming along the line hand over hand

Whitsitt had gone inside but he had recycled the lock and left it open for them. They went on in, to be met there by the Honorable Jonathan Fries, Mayor of Rock City. He was a small, bald, potbellied man with a sharp, merry look in his eye and a stylus tucked back of his ear. He shook hands with Roger Stone enthusiastically. 'Welcome, welcome! We're honored to have you with us, Mister Mayor. I ought to have a key to the city, or some such, for you. Dancing girls and brass bands.'

Roger shook his head. 'I'm an ex-mayor and a private traveler. Never mind the brass bands.'

'But you'll take the dancing girls?'

'I'm a married man. Thanks anyhow.'

'If we had any dancing girls I'd keep 'em for myself. And I'm a married man, too.'

'You certainly are!' A plump, plain but very jolly woman had floated up behind them.

Yes, Martha.' They completed the rest of the introductions; Mrs Fries took Hazel in tow; the twins trailed along with the two men, into the forward half of the globe. It was a storeroom and a shop; racks had been fitted to the struts and thrust members; goods and provisions of every sort were lashed or netted to them. Don Whitsitt clung with his knees to a saddle in the middle of the room with a desk folded into his lap. In his reach were ledgers on lazy tongs and a rack of clips holding several hundred small account books. A miner floated in front of him. Several more were burrowing through the racks of merchandise.

Seeing the display of everything a meteor miner could conceivably need, Pollux was glad that they had concentrated on luxury goods then remembered with regret that they had precious little left to sell; the flat cats, before they were placed in freeze, had eaten so much that the family had been delving into their trade goods, from caviar to Chicago sausage. He whispered to Castor, 'I had no idea the competition would be so stiff.'

'Neither did I.'

A miner slithered up to Mr Fries. 'One-Price, about that centrifuge -'

'Later, Sandy. I'm busy.'

Captain Stone protested, 'Don't let me keep you from your customers.'

'Oh, Sandy hasn't got anything to do but wait. Right, Sandy? Shake hands with Captain Stone - it was his wife who fixed up old Jocko.'

'It was? Say, I'm mighty proud to know you, Captain! You're the best news we've had in quite a while.' Sandy turned to Fries. 'You better put him right on the Committee.'

'I shall. I'm going to call a phone meeting this evening.'

'Just a moment!' objected Roger Stone. 'I'm just a visitor. I don't belong on your Citizens' Committee.'

Fries shook his head. 'You don't know what it means to our people to have a medical doctor with us again. The Committee ain't any work, really. It's just to let you know we're glad you've joined us. And we'll make Mrs Stone - I mean Doctor Stone - a member if she wants it. She won't have time for it, though.'

Captain Stone was beginning to feel hemmed in. 'Slow down! We expect to be leaving here come next Earth departure - and my wife is not now engaged in regular practice, anyhow. We're on a pleasure trip.'

Fries looked worried. 'You mean she won't attend the sick? But she operated on Jock Donaher.'

Stone was about to say that she positively would not under any circumstances take over a regular practice when he realized that he had very little voice in the matter. 'She'll attend the sick. She's a doctor.'

'Good!'

'But, confound it, man! We didn't come here for that She's on a vacation.'

Fries nodded. 'We'll see what we can work out to make it easy on her. We won't expect the lady to go hopping rocks the way Doc Schultz did. Get that, Sandy? We can't have every rock-happy rat in the swarm hollering for the doctor every time he gets a sore finger. We want to get the word around that if a man gets sick or gets hurt it's up to him and his neighbours to drag him in to City Hall if he can possibly wear a suit. Tell Don to draft me a proclamation.'

The miner nodded solemnly. 'That's right, One-Price.'

Sandy moved away; Fries went on, 'Let's go back into the restaurant and see if Martha has some fresh coffee. I'd like to get your opinion on several civic matters'

'Frankly, I couldn't possibly have opinions on your public affairs here. Things are so different'

'Oh, why don't I be truthful and admit I want to gossip about politics with another pro. I don't meet one every day. First, though, did you have any shopping in mind today? Anything you need? Tools? Oxy? Catalysts? Planning on doing any prospecting and if so, do you have your gear?'

'Nothing especial today - except one thing: we need to buy, or by preference rent, a scooter. We'd like to explore a bit'

Fries shook his head. 'Friend, I wish you hadn't asked me that. That's one thing I haven't got All these sand rats booming in here from Mars, and even from Luna, half of 'em with no equipment They lease a scooter and a patent igloo and away they go, red hot to make their fortunes. Tell you what I can do, though - I've got more rocket motors and tanks coming in from Ceres two months from now. Don and I can weld you up one and have it ready to slap the motor in when the *Firefly* gets here.'

Roger Stone frowned, 'With Earth departure only five months away that's a long time to wait'

'Well, we'll just have to see what we can scare up. Certainly the new doctor is entitled to the best - and the doctor's family. Say -".

A miner tapped him on the shoulder. 'Say, storekeeper, I -'

Fries' face darkened. 'You can address me as "Mr Mayor!"'

'Huh?'

'And beat it! Can't you see I'm busy?' The man backed away; Fries fumed, '"One Price" I'm known as, to my friends and to my enemies, from here to the Trojans. If he doesn't know that, he can call me by my title - or take his trade elsewhere. Where was I? Oh, yes! You might try old Charlie.'

'Eh?'

'Did you notice that big tank moored to City Hall? That's Charlie's hole. He's a crazy old coot, rock-happy as they come, and he's a hermit by intention. Used to hang around the edge of the community, never mixing - but with this boom and ten strangers swarming in for every familiar face Charlie got timid and asked could he please tie in at civic center? I guess he was afraid that somebody would slit his throat and steal his hoorah's nest Some of the boomers are a rough lot at that'

'He sounds like some of the oldtimers on Luna. What about him?'

'Oh! Too much on my mind these days; it wanders. Charlie runs a sort of a fourth-hand shop, and I say that advisedly. He has stuff I won't handle. Every time a rock jumper dies, or goes Sunside, his useless plunder winds up in Charlie's hole. Now I don't say he's got a scooter - though you just might lease his own now that he's moored in-city. But he might have parts that could be jury-rigged. Are you handy with tools?'

'Moderately. But I've got just the team for such a job.' He looked around for the twins, finally spotted them pawing through merchandise. 'Cas! Pol! Come here.'

The storekeeper explained what he had in mind. Castor nodded. 'If it worked once, we'll fix it'

'That's the spirit Now let's go test that coffee.'

Castor hung back 'Dad? Why don't Pol and I go over there and see what he's got? It'll save you time.'

'Well-'

'It's just a short jump',' said Fries.

'Okay, but don't jump. Use your lines and follow the mooring line over.'

The twins left Once in the airlock Pollux started fuming. 'Stow it,' said Cas. 'Dad just wants us to be careful.'

'Yes, but why does he have to say it where everybody can hear?'

Charlie's hole, they decided, had once been a tow tank to deliver oxygen to a colony. They let themselves into the lock, started it cycling. When pressure was up, they tried the inner door; it wouldn't budge. Pollux started pounding on it with his belt wrench while Castor searched for a switch or other signal. The lock was miserably lighted by a scant three inches of glow tube.

'Cut the racket,' Castor told Pollux. 'If he's alive, he's heard you by now.' Pollux complied and tried the door again - still locked.

They heard a muffled voice: 'Who's there?'

Castor looked around for the source of the voice, could not spot it. 'Castor and Pollux Stone,' he answered, 'from the *Rolling Stone,* out of Luna'

Somebody chuckled. 'You don't fool me. And you *can't* arrest me without a warrant Anyhow I won't let you in.'

Castor started to explode,' Pollux patted his arm. 'We aren't cops.

Shucks, we aren't old enough to be cops.'

'Take your. helmets off.'

'Don't do it,' Castor cautioned. 'He could recycle while we're unsealed.'

Pollux went ahead and took his off; Castor hesitated, then followed. 'Let us in,' Pollux said mildly.

'Why should I?'

'We're customers. We want to buy things.'

'What you got to trade?'

'We'll pay cash'

'Cash!' said the voice. 'Banks! Governments! What you got to *trade?* Any chocolate?'

'Cas,' Pollux whispered, 'have we got *any* chocolate left?'

'Maybe six or seven pounds. Not more.'

'Sure we got chocolate.'

'Let me see it.'

Castor interrupted. 'What sort of nonsense is this? Pol, let's go back and see Mr Fries again. He's a businessman.'

The voice moaned, 'Oh, don't do that! He'll cheat you.'

'Then open up!'

After a few seconds of silence the voice said wheedlingly,. 'You look like nice boys. You wouldn't hurt Charlie? Not old Charlie?'

'Of course not We want to trade with you.'

The door opened at last In the gloom a face, etched by age and darkened by raw sunlight, peered out at them 'Come in easy. Don't try any tricks - I know you.'

Wondering if it were the sensible thing to do the boys pulled themselves in. When their eyes adjusted to the feeble circle of glow tube in the middle of the space they looked around while their host looked at them. The tank, large outside, seemed smaller by the way it was stuffed. As in Fries' shop, every inch, every strut, every nook was crammed, but where the City Hall was neat, this was rank disorder, where Fries' 'shop was rational, this was nightmare confusion. The air was rich enough but ripe with ancient and nameless odors.

Their host was a skinny monkey of a man, covered with a single dark garment, save for head, hands, and bare feet. It had once been, Pollux decided, heated underwear for spacesuit use far out starside, or in caves.

Old Charlie stared at them, then grinned, reached up and scratched his neck with his big toe. 'Nice boys,' he said. 'I knew you wouldn't hurt Charlie. I was just foolin'.'

'We wouldn't hurt anybody. We just wanted to get aquainted, and do a little business.'

'We want a - ' Pollux started; Castor's elbow cut off the rest; Castor 'went on,

'Nice place you've got here.'

'Comfortable. Practical. Just right for a man with no nonsense about him. Good place for a man who likes to be quiet and think. Good place to read a book You boys like to read?'

'Sure. Love to.'

'You want to see my books?' Without waiting for an answer he dared like a bat into the gloom, came back In a few moments with books in both hands and a half dozen held by his feet. He bumped to a stop with his elbows and offered them

There were oldstyle bound books, most of them, the twins saw, ships' manuals of ships long dead. Castor's eyes widened when he saw the dates on some of them, and wondered what the Astrogation Institute would pay for them. Among them was a dog-eared copy of Mark Twain's *Life on the Mississippi.*

'Look 'em over, boys. Make yourselves comfortable. Bet you didn't expect to find a literary man out here among these yokels. You boys can read, can't you?'

'Sure we can''

'Didn't know. They teach such funny things nowadays. Quote a bit of latin to 'em and they look like you're crazy in the head. You boys hungry? You want something to eat?' He looked anxious.

They both assured him that they had fed well and recently; he looked relieved. 'Old Charlie ain't one to let a man go hungry, even if he hasn't got enough for himself.' Castor had noted a net of sealed rations; there must have been a thousand of them by conservative estimate. But the old man continued, 'Seen the time, right herein this node - no, it was the Emmy Lou - when a man didn't dare make breakfast without he barred his lock first and turned off his beacon. It was about that time that Lafe Dumont ate High-Grade Henderson. He was dead first, naturally - but it brought on a crisis in our community affairs. They formed up the vigilantes, what they call the Committee nowadays.'

'Why did he eat him?'

'Why, he was *dead.* I told you that Just the same, I don't think a man ought to eat his own partner, do you?'

The boys agreed that it was a breech of etiquette.

'I think he ought to limit it to members of his own family, unless the two of them have got a signed and sealed contract. See any ghosts yet?'

The acceleration was so sharp that it left both the twins a bit oonfuted. 'Ghosts?'

'You will. Many's the time I've talked to High-Grade Henderson. Said he didn't blame Lafe a bit, would 'a' done the same thing in his place. Ghosts all around here. All the rockmen that have died out here, they can't get back to Earth. They're in a permanent orbit - see? And it stands to reason that you can't accelerate anything that doesn't have mass.' He leaned toward them confidentially. 'Sometimes you see 'em, but mostly they whisper in your earphones. And when they do, *listen* - because that's the only way you'll ever find any of the big strikes that got found and then got lost again. I'm telling you this because I like you, see? So listen. If it's too faint, just close your chin valve and hold your breath; then it comes clearer.'

They agreed and thanked him. 'Now tell me about yourselves, boys.' To their surprise he appeared to mean it; when they slowed down he taxed them for details, filling in only occasionally with his own disjointed anecdotes. At last Castor described the fiasco of the flat cats. 'So that's why we don't have much food to trade with. But we do have some chocolate left and lots of other things.'

Charlie rocked back and forth from his perch in the air. 'Flat cats, eh? I ain't had my hands on a flat cat in a power of years. Nice to hold, they are. Nice to have around. Philosophical, if we just understand 'em.' He suddenly fixed Castor with his eye. 'What you planning to do with all those flat cats?'

'Why, nothing, I guess.'

'That's just what I thought You wouldn't mind giving a poor old man who hasn't kith nor kin nor wife nor chick one of those harmless flat cats? An old man who would always give you a bite to eat and a charge for your suit bottle?'

Castor glanced at Pollux and agreed cautiously that any dicker they reached would certainly include a flat cat as a mark of faith in dealing. 'Then what do you want? You talked about scooters. You know old Charlie hasn't got a scooter - except the one I have to have myself to stay alive.'

Castor broached the notion about repairing old parts, fitting together a scooter. Charlie scratched an inch-long stubble. 'Seems. to me I did have a rocket motor - you wouldn't mind if it lacked a valve or two? Or did I trade that to Swede Gonzalez? No, that was another one. I think - just a second while I take a look.' He was gone more nearly 600 seconds, buried in the mass; he came out dragging a piece of junk behind. 'There you are! Practically new. Nothing a couple of bright boys couldn't fix.'

Pollux looked at Castor. 'What do you think it's worth?'

Castor's lips moved silently: 'He ought to pay us to take it away.' It took them another twenty minutes but they got it for three pounds of chocolate and one flat cat.

XVII - FLAT CATS FINANCIAL

It took the better part of two weeks to miake the ancient oxyalcohol engine work; another week to build a scooter rack to receive it, using tubing from Fries' secondhand supply. It was not a pretty thing, but, with the *Stone's* stereo gear mounted on it, it was an efficient way to get around the node. Captain Stone shook his head over it and subjected it to endless tests before he conceded that it was safe even though ugly.

In the meantime the Committee had decreed a taxi service for the doctor lady; every miner working within fifty miles of City Hall was required to take his turn at standby watch with his scooter, with a fixed payment in high grade for any run he might have to make. The Stones saw very little of Edith Stone during this time: it seemed as if every citizen of Rock City had been saving up ailments.

But they were not forced to fall back on Hazel's uninspired cooking. Fries had the *Stone* warped into contact with City Hall and a passenger tube sealed from the *Stone's* lock to an unused hatch of the bigger ship; when Dr Stone was away they ate in his restaurant Mrs Fries was an excellent cook and she raised a great variety in her hydroponics garden.

While they were rigging the scooter the twins had time to mull over the matter of the flat cats. It had dawned on them that here in Rock City was a potential, unexploited market for flat cats. The question was: how best to milk it for all the traffic would bear?

Pol suggested that they peddle them in the scooter; he pointed out that a man's sales resistance 'was lowest, practically zero, when he actually had a flat cat in his hands. His brother shook his head 'No good,' Junior.'

'Why not?'

'One, the Captain won't let us monopolize the scooter; you know he regards it as ship's equipment, built by the crew, namely us. Two, we would burn up our profits in scooter fuel. Three, it's too slow; before we could move a third of them, some idiot would have fed our first sale too much, it has kittens - and there you are, with the market flooded with flat cats. The idea is to sell them as nearly as possible all at one time.'

'We could stick up a sign in the store - One-Price would let us - and sell them right out of the *Stone.'*

'Better but not good enough. Most of these rats shop only every three or four months. No, sir, we've got to build that better mouse trap and make the world beat a path to our door.'

'I've never been able to figure out why anybody would want to trap a mouse. Decompress a compartment and you kill all of them, every time.'

'Just a figure of speech, no doubt Junior, what can we do to make Rock City flat-cat conscious?'

They found a way. The Belt, for all its lonely reaches - or because of them - was as neighbourly as a village. They gossiped among themselves, by suit radio. Out in the shining blackness it was good to know that, if something went wrong, there was a man listening not five hundred miles away who would come and investigate if you broke off and did not answer.

They gossiped from node to node by their more powerful ship's radios. A rumor of death, of a big strike, or of accident, would bounce around the entire belt, relayed from rockman to rockman, at just short of the speed of light. Heartbreak node was sixty-six light minutes away, following orbit; big news often reached it in less than two hours, including numerous manual relays.

Rock City even had its own broadcast. Twice a day One-Price picked up the news from Earthside, then rebroadcast it with his own salty comments. The twins decided to follow it with one of their own, on the same wave length - a music & chatter show, with commercials. Oh, decidedly with commercials. They had hundreds of spools in stock which they could use, then sell, along with the portable projectors they had bought on Mars.

They started in; the show never was very good, but, on the other hand, it had no competition and it was free. Immediately following Fries' sign-off Castor would say, 'Don't go away, neighbours! Here we are again with two hours of fun and music - and a few tips on bargains. But first, our theme - the warm and friendly purr of a Martian flat cat.' Pollux would hold Fuzzy Britches up to the microphone and stroke it; the good-natured little creature would always respond with a loud buzz. 'Wouldn't that be nice to come home to? And now for some music: Harry Weinstein's Sunbeam Six in "High Gravity". Let me remind you that this tape, like all other music on this program, may be purchased at an amazing saving in Flat Cat Alley, right off the City Hall - as well as Ajax three-way projectors in the Giant, Jr. model, for sound, sight, and stereo. The Sunbeam Six - hit it, Harry!'

Sometimes they would do interviews:

Castor: 'A few words with one of our leading citizens, Rocks-in-his-Head Rudolf. Mr Rudolf, all Rock City is waiting to hear from you. Tell me, do you like it out here?'

Pollux: 'Naw!'

Castor: 'But you're making lots of money, Mr Rudolf?'

Pollux: 'Naw!'

Castor: 'At least you bring in enough high grade to eat well

'Naw!'

'No? Tell me, why did you come out here in the first place?'

Pollux, 'Bub, was *you* ever married?'

Sound effect of blow with blunt instrument, groan, and the unmistakable cycling of an air lock - Castor: 'Sorry, folks. My assistant has just spaced Mr Rudolf. To the purchaser of the flat cat we had been saving for Mr Rudolf we will give away - absolutely free! - a beautiful pin-up picture printed in gorgeous living colors on fireproof paper. I hate to tell you what these pictures ordinarily sell for on Ceres; it hurts me to say how little we are letting them go for now, until our limited stock is exhausted. To the very first customer who comes in that door wanting to purchase a flat cat we will - Lock that door! Lock that door! All right, all right - all three of you will receive pin-up pictures; we don't want anyone fighting here. But you'll have to wait until we finish this broadcast Sorry, neighbours - a slight interruption but we settled it without bloodshed. But I find myself in a dilemma. I made you a promise and I did not know what would happen, but the truth is, too many customers were already here, pounding on the door of Flat Cat Alley. But to make good our promise I am enlarging it: not to the first customer, not to the second, nor to the third - but to the next *twenty* persons purchasing flat cats will go, absolutely free, one of these gorgeous pictures. Bring no money - we accept high grade or core material at the standard rates.'

Sometimes they varied it by having Meade sing. She was not of concert standards, but she had a warm, intimate contralto. After hearing her, a man possessing not even a flat cat felt lonely indeed. She pulled even better than the slick professional recordings; the twins found it necessary to cut her in for a percentage.

But in the main they depended on the flat cats themselves. The boomers from Mars, almost to a man, bought flat cats as soon as they heard that they were available, and each became an unpaid travelling salesman for the enterprise. Hardrock men from Luna, or directly from Earth, who had never seen a flat cat, now had opportunities to see them, pet them, listen to their hypnotic purr - and were lost. The little things not only stirred to aching suppressed loneliness, but, having stimulated it, gave it an outlet.

Castor would hold Fuzzy Britches to the mike and coo, 'Here is a little darling - Molly Malone. Sing for the boys, honey pet.' While he stroked Fuzzy Britches Pollux would step up the power. 'No, we can't let Molly go - she's a member of the family. But here is Bright Eyes. We'd like to keep Bright Eyes, too, but we mustn't be selfish. Say hello to the folks,. Bright Eyes.' Again he would stroke Fuzzy Britches. 'Mr P., now hand me Velvet.'

The stock of flat cats in deep freeze steadily melted. Their stock of high grade grew.

Roger Stone received their suggestion that they save out a few for breeding stock with one of his more emphatic refusals; once, he declaimed, was enough to be swamped in flat cats. Fuzzy Britches could stay, safely on short rations - but one was enough.

They had reached the last few at the back of the hold and were thinking about going out of business when a tired-looking, grey-haired man showed up after their broadcast. There were several other customers; he hung back and let the twins sell flat cats to the others. He had with him a girl child, little older than Lowell. Castor had not seen him before but he guessed that he might be Mr Erska; bachelors far outnumbered families in the node and families with children were very rare. The Erskas picked up a precarious living down orbit and north; they were seldom seen at City Hall. Mr Erska spoke Basic with some difficulty; Mrs Erska spoke it not at all. The family used some one of the little lingos - Icelandic, it might have been.

When the other customers had left the *Stone* Castor put on his professional grin and introduced himself. Yes, it was Mr Erska. 'And what can I do for you today, sir? A flat cat?'

'I'm afraid not'

'How about a projector? With a dozen tapes thrown in? Just the thing for a family evening.'

Mr Erska seemed nervous. 'Uh, very nice, I'm sure. No.' He tugged at the little girl's hand. 'We better go now, babykin.'

'Don't rush off. My baby brother is around somewhere - or was. He'd like to meet your kid. Maybe he's wandered over into the store. I'll look for him''

'We better go.'

'What's the rush? He can't be far.'

Mr Erska swallowed in embarrassment 'My little girl. She heard your program and she wanted to see a flat cat. Now she's seen one, so we go.'

'Oh-' Castor brought himself face to face with the child. 'Would you like to hold one, honey?' She did not answer, but nodded solemnly. 'Mr P.,. bring up the Duchess.'

'Right, Mr C.' Pollux went aft and fetched the Duchess - the first flat cat that came to hand, of course. He came back, warming it against his belly to revive it quickly.

Castor took it and massaged it until it flattened out and opened its eyes. 'Here, honeybunch. Don't be afraid'

Still silent, the child took it, cuddled it The small furry bundle sighed and began to purr. Castor turned to her father. 'Don't you want to get it for her?'

The man turned red. 'No, no!'

'Why not? They're no trouble. She'll love it. So will you.'

'No!' He reached out and tried to take the flat cat from his daughter, speaking to her in another language.

She clung to it, replying in what was clearly the negative. Castor looked at them thoughtfully. 'You would like to buy it for her, wouldn't you?'

The man looked away. 'I can't buy it'

'But you want to.' Castor glanced at Pollux. 'Do you know what you are, Mr Erska. You are the five *hundredth* customer of Flat Cat Alley.'

'Uh?'

'Didn't you hear our grand offer? You must have missed one of our programs. The five hundredth flat cat is *absolutely free.'*

The little girl looked puzzled but clung to the flat cat Her father looked doubtful. 'You're fooling?'

Castor laughed. 'Ask Mr P.'

Pollux nodded solemnly. 'The bare truth, Mr Erska. It's a celebration of a successful season. One flat cat, absolutely free with the compliments of the management And with it goes either one pin-up, or two candy bars - your choice.'

Mr Erska seemed only half convinced, but they left with the child clinging to 'Duchess' and the candy bars. When the door was closed behind them Castor said fretfully, 'You didn't need to chuck in the candy bars They were the last; I didn't mean us to sell them"

'Well, we didn't sell them; we gave 'em away.'

Castor grinned and shrugged. 'Okay, I hope they don't make her sick. What was her name?'

'I didn't get it'

'No matter. Our Mrs Fries will know.' He turned around, saw Hazel behind them in the hatch. 'What are *you* grinning about?'

'Nothing, nothing. I just enjoy seeing a couple of cold-cash businessmen at work'

'Money isn't everything I'

'Besides,' added Pollux, 'it's good advertising.'

'Advertising? With your stock practically gone?' She snickered. 'There wasn't any "grand offer" - and Ill give you six to one it wasn't your five hundredth sale.'

Castor looked embarrassed. 'Aw, she wanted it! What would you have done?'

Hazel moved up to them, put an arm around the neck of each. 'My boys! I'm beginning to think you may grow up yet. In thirty, forty, fifty more years you may be ready to join the human race.'

'Aw, lay off it!'

XVIII - THE WORM IN THE MUD

Cost-accounting on the flat-cat deal turned out to be complicated. The creatures were all descendants of Fuzzy Britches, chattel of Lowell. But the increase was directly attributable to food fed to them by everyone - which in turn had forced them to eat most of the luxury foods stocked by the twins for trade. But it had been the twins' imaginative initiative which had turned a liability into an asset. On the other hand they had used freely the capital goods (ship and electronic equipment) belonging to the entire family. But how to figure the probable worth of the consumed luxury foods? Whatever the figure was, it was not just original cost plus lift fuel.

Roger Stone handed down a Solomon's decision. From the gross proceeds would be subtracted Meade's percentage for singing; the twins would be reimbursed for the trade goods that had been commandeered; the balance would be split three ways among the twins and Lowell - all to be settled after they had traded high grade for refined metal at Ceres, then sold their load at Luna.

In the meantime he agreed to advance the twins' money to operate further. Fries having promised to honor his sight draft on Luna City National.

But for once the twins found no immediate way to invest money. They toyed with the idea of using their time to prospect on their own, but a few trips out in the scooter convinced them that it was a game for experts and one in which even the experts usually made only a bare living. It was the fixed illusion that the next mass would be 'the glory rock' - the one that would pay for years of toil - that kept the old rockmen going. The twins knew too much about statistics now, and they believed in their ability rather than their luck. Finding a glory rock was sheer gamble.

'Ihey made one fairly long trip into the thickest part of the node, fifteen hundred miles out and back taking all one day and the following night to do it. They got the scooter up to a dawdling hundred and fifty miles per hour and let it coast, planning to stop and investigate if they found promising masses having borrowed a stakeout beacon from Fries with the promise that they would pay for it they kept it

They did not need it. Time after time they would spot a major blip in the stereo radar, only to have someone else's beacon wink on when they got within thirty miles of the mass. At the far end they did find a considerable collection of rock travelling loosely in company; they matched, shackled on their longest lines (their father had emphatically forbidden free jumping) and investigated. Having neither experience nor a centrifuge, their only way of checking on specific gravity was by grasping a mass and clutching it to them vigorously, then getting a rough notion of its inertia by its resistance to being shoved around. A Geiger counter (borrowed) had shown no radioactivity; they were searching for the more valuable core material.

Two hours of this exercise left them tired but no richer. 'Grandpa,' announced Pollux, 'this is a lot of leftover country rock.'

'Not even that. Most of it's pumice, I'd say.'

'Git for home?'

'Check.'

They turned the scooter around by flywheel and homed on the City Hall beacon, boosting it up to four hundred miles per hour before. letting it coast, that being the top maneuver they could figure on for the juice they had left in their tanks. They would have preferred to break the speed limit, being uneasily aware that they were late - and being anxious to get home; the best designed suit is not comfortable for too long periods. They knew that their parents would not be especially worried; while they were out of range for their suit radios, they had reported in by the gossip grapevine earlier.

Their father was not worried. But the twins spent the next week under hatches, confined to the ship for failing to get back on time.

For a longer period nothing more notable took place than the incident in which Roger Stone lost his breathing mask while taking a shower and almost drowned (so he claimed) before he could find the water cut-off valve. There are very few tasks easier to do in a gravity field than in free fall, but bathing is one of them.

Dr Stone continued her practice, now somewhat reduced. Sometimes she was chauffeured by the miner assigned to that duty; sometimes the twins took her around. One morning following her office hours in City Hall she came back into the *Stone* looking for the twins. 'Where are the boys?'

'Haven't seen them since breakfast,' answered Hazel. 'Why?'

Dr Stone frowned slightly. 'Nothing, really. I'll ask Mr Fries to call a scooter for me.'

'Got to make a call? I'll take you unless those lunks have taken our scooter.'

'You needn't, Mother Hazel.'

'I'd enjoy it I've been promising Lowell a ride for weeks. Or will it take too long?'

'Shouldn't. It's only eight hundred miles or so out.' The doctor was not held down to the local speed limit in her errand of mercy.

'Do it in two hours, with juice to spare.' Off they went, with Buster much excited. Hazel allotted one-fourth her fuel as safety margin, allotted the working balance for maximum accelerations, figuring the projected mass-ratios in her head. Quite aside from the doctor's privilege to disregard the law, high speed was not dangerous in the sector they would be in, it being a 'thin' volume of the node.

Their destination was an antiquated winged rocket, the wings of which had been torched off and welded into a tent-shaped annex to give more living room. Hazel thought that it had a shanty-town air - but so did many of the ships in Rock City. She was pleased enough to go inside and have a sack of tea and let Lowell out of his spacesuit for a time. The patient, Mr Bakers, was in a traction splint; his wife could not pilot their scooter, which was why Dr Stone granted the house call. Dr Stone received a call by radio while they were there; she came back into the general room looking troubled. 'Smatter?' inquired Hazel.

'Mrs Silva. I'm not really surprised; it's her first child.'

'Did you get the coordinates and beacon pattern? I'll run you right

'Lowell?'

'Oh. Oh, yes,' It would be a long time in a suit for a youngster.

Mrs Eakers suggested that they leave the child with her.

Before Lowell could cloud up at the suggestion Dr Stone said, 'Thanks, but it isn't necessary. Mr Silva is on his way here. What I was trying to say, Mother Hazel, is that I probably had better go with him and let you and Lowell go back alone. Do you mind?'

'Of course not. Pipe down, Lowell! I'll have us home in three-quarters of an hour and Lowell can have his nap or his spanking on time, as the case may be.'

She gave Dr Stone one of two spare oxygen bottles before she left; Dr Stone refused to take both of them. Hazel worked the new mass figures over; with Edith, her suit, and the spare bottle subtracted she had spare fuel. Better hit it up pretty fast and get home before the brat got cranky -

She lined up on City Hall by flywheel and stereo, spun on that axis to get the sun out of her eyes, clutched her gyros, and gave it the gun.

The next thing she knew she was tumbling like a liner in free fall. She remembered from long habit to cut the throttle but only after a period of aimless acceleration, for she had been chucked around in her saddle, thrown against her belts, and could not at first find the throttle.

When they were in free fall again she remembered to laugh. 'Some ride, eh, Lowell?'

'Do it again, Grandma!'

'I hope not' Quickly she checked things over. There was not much that could go wrong with the little craft, it being only a rocket motor, an open rack with saddles and safety harness, and a minimum of instruments and controls. It was the gyros, of course; the motor had been sweet and hot. They were hunting the least bit, she found, that being the only evidence that they had just tumbled violently. Delicately she adjusted them by hand, putting her helmet against the case so that she could hear what she was doing.

Only then did she try to find where they were and where they were going. Let's see - the Sun is over there and that's Betelgeuse over yonder - so City Hall must be out that way. She ducked her helmet into the hemispherical 'eye shade' of the stereo. Yup! there she be!

The Eakers place was the obvious close-by point on which to measure her vector. She looked around for it, was startled to discover how far away it was. They must have coasted quite a distance while she was fiddling with the gyros. She measured the vector in amount and direction, then whistled. There were, she thought, few grocery shops out that way - darn few neighbours of any sort. She decided that it might be smart to call Mrs Eakers and tell her what had happened and ask her to call City Hall - just in case.

She could not raise Mrs Eakers. The sloven, she thought bitterly, has probably switched off her alarm so she could sleep. Lazy baggage! Her house looked it - and smelled it, too.

But she kept trying to call Mrs Eakers, or anyone else in range of her suit radio while she again lined up the ship for City, with offset to compensate for the now vector. She was cautious and most alert this time - in consequence she wasted only a few seconds of fuel when the gyros again turnbled.

She unclutched the gyros and put them out of her mind, then took careful measure of the situation. The Eakers dump was now a planetary light in the sky, shrinking almost noticeably, but it was still the proper local reference point. She did not like the vector she got. As always, they seemed to be standing still in the exact center of a starry globe - but her instruments showed them speeding for empty space, headed clear outside the node.

'What's the matter, Grandma Hazel?'

'Nothing, son, nothing. Grandma has to stop and look at some road signs, that's all.' She was thinking that she would gladly swap her chance of eternal bliss for an automatic distress signal and a beacon. She reached over, switched off the child's receiver, then repeatedly called for help.

No answer. She switched Lowell's receiver back on. 'Why. did you do that, Grandma Hazel?'

'Nothing. Just checking it'

'You can't fool me! You're scared! Why?'

'Not scared, pet Worried a little, maybe. Now shut up; Grandma's got work to do.'

Carefully she lined up the craft by flywheel; carefully she checked it when it tried to swing past She aimed both to offset the new and disastrous vector and to create a vector for City Hall. She intentionally left the gyros unclutched. Then she restrapped Lowell in his saddle, checked its position. 'Hold still,' she warned. 'Move your little finger and Grandma will scalp you'

Just as carefully she positioned herself, considering lever arms, masses, and angular moments in her head Without gyros the craft must be balanced just so. 'Now,' she said to herself, 'Hazel, we find out whether you are a pilot - or just a Sunday pilot.' She ducked her helmet into the eyeshade, picked a distant blip on which to center her crosshairs, and gunned the craft

The blip wavered; she tried to rebalance by shifting her body. When the blip suddenly slipped off to one side she cut the throttle quickly. Again she checked her vector. Their situation was somewhat improved. Again she called for help, not stopping to cut the child out of hearing. He said nothing and looked grave.

She went through the same routine, cutting power again when the craft 'fell off its tail.' She measured the vector, called for help - and did it all again. A dozen times she tried it. On the last try the thrust stopped with the throttle still wide open. With all fuel gone there was no need to be in a hurry. She measured her vector most carefully on the Eakers' ship, now far away, then checked the results against the City Hall blip, all the while calling for help. She ran through the figures again; in a fashion she had been successful. They were now unquestionably headed for City Hall, could not miss it by more than a few miles at most - almost jumping distance. But, while the vector was correct in direction, it was annoyingly small in quantity - six hundred and fifty miles at about forty miles an hour; they would be closest in about sixteen hours.

She wondered whether Edith really had needed that other spare oxygen bottle. Her own gauge showed about half full. She called for help again, then decided to go through the problem once more; maybe she had dropped a decimal in her head. While she was lining up on City Hall, the tiny light in the stereo tank faded and died. Her language caused Lowell to inquire, 'What's the matter now, Grandma?'

'Nothing more than I should have expected, I guess. Some days, hon, it just isn't worth while to wake up in the morning.' The trouble, she soon found, was so simple as to be beyond repair. The stereo radar would no longer work because all three cartridges in the power pack were dead. She was forced to admit that she had been using it rather continuously - and it took a lot of power.

'Grandma Hazel! I want to go home!' She pulled out of her troubled thoughts to answer the child.

'We're going home, dear. But it's going to take quite a while.'

'I want to go home *right now?'*

'I'm sorry but you can't"

'But -'

'Shut it up - or when I get you out of that sack, I'll give you something to yelp for. I mean it" She again called for help.

Lowell made one of his lightning changes to serenity. 'That's better,' approved Hazel. 'Want to play a game of chess?'

'No.'

'Sissy. You're afraid I'll beat you. I'll bet you three spanks and a knuckle rub.'

Lowell considered this. 'I get the white men?'

'Take 'em. I'll beat you anyhow.'

To her own surprise she did. It was a long drawn-out game; Lowell was not as practised as she was in visualising a board and they had had to recount the moves on several occasions before he would concede the arrangement of men . . . and between each pair of moves she had again called for help. About the middle of the game she had found it necessary to remove her oxygen bottle and replace it with the one spare. She and the child had started out even but Lowell's small mass demanded much less oxygen.

'How about another one? Want to get your revenge?'

'No! I want to go *home.'*

'We're going home, dear.'

'How soon?'

'Well... it'll be a while yet I'll tell you a story.'

'What story?'

'Well, how about the one about the worm that crawled up out of the mud?'

'Oh, I know that one! I'm tired of it'

'There are parts I've never told you, And you can't get tired of it, not really, because there is never any end to it. Always something new.' So she told him again about the worm that crawled up out of the slime, not because it didn't have enough to eat, not because it wasn't nice and warm and comfortable down there under the water - but because the worm was restless. How it crawled up on dry land and grew legs. How part of it got to be the Elephant's Child and part of it got to be a monkey, grew hands, and fiddled with things. How, still insatiably restless, it grew wings and reached up for the stars. She spun it out a long, long time, pausing occasionally to call for aid.

Thechild was either bored and ignored her, or liked it and kept quiet on that account. But when she stopped he said, 'Tell me another one'

'Not just now, dear.' His oxygen gauge showed empty.

'Go on! Tell me a new one - a better one.'

'Not now, dear. That's the best story Hazel knows. The very best. I told it to you again because I want you to remember it' She watched his anoxia warning signal turn red, then quietly disconnected the partly filled bottle on her own suit, closing the now useless suit valves, and replaced his empty bottle with hers. For a moment she considered cross-connecting the bottle to both suits, then shrugged and let it stand. 'Lowell -'

'What, Grandma?'

'Listen to me, dear. You've heard me caning for help. You've got to do it now. Every few minutes, all the time.'

'Why?'

'Because Hazel is tired, dear. Hazel has to sleep. Promise me you'll do it'

'Well... all right'

She tried to hold perfectly still, to breathe as little of the air left in her suit as possible. It wasn't so bad, she thought She *had* wanted to see the Rings - but there wasn't much else she had missed. She supposed everyone had his Carcassonne; she had no regrets.

'Grandma! Grandma Hazel!' She did not answer. He waited, then began to cry, endlessly and without hope.

Dr Stone arrived back at the *Rolling Stone* to find only her husband there. She greeted him and added, 'Where's Hazel, dear? and Lowell?'

'Eh? Didn't they come back with you? I supposed they had stopped in the store.'

'No, of course not'

'Why "of course not"?'

She explained the arrangement; he looked at her in stunned astonishment 'They left the same time you did?'

'They intended to. Hazel said she would be home in fortyfive minutes.'

'There's a bare possibility that they are still with the Eakers. We'll find out.' He lunged toward the door.

The twins returned to find their home and City Hall as well in turmoil. They had been spending an interesting and instructive several hours with old Charlie.

Their father turned away from the *Stone's* radio and demanded, 'Where have you two been?'

'Just over in Charlie's hole. What's the trouble?'

Roger Stone explained. The twins looked at each other. 'Dad,' Castor said painfully, 'you mean Hazel took Mother out in *our* scooter?'

'Certainly.' The twins questioned each other wordlessly again.

'Why shouldn't she? Speak up.'

'Well, you . . . well, it was like this -'

'Speak up!'

'There was a bearing wobble, or something, in one of the gyros,' Pollux admitted miserably. We were working on it'

'You were? In Charlie's place!'

'Well, we went over there to see what he had in the way of spare parts and, well, we got detained, sort of.'

Their father looked at them for several seconds with no expression of any sort. He then said in a flat voice, 'You left a piece of ship's equipment out of commission. You failed to log it. You failed to report it to the Captain. He paused. 'Go to your room.'

'But Dad! We want to help!'

'Stay in your room; you are under arrest'

The twins did as they were ordered. While they waited, the whole of Rock City was alerted. The word went out: the doctor's little boy is missing; the boy's grandmother is missing. Fuel up your scooters; stand by to help. Stay on this wave length.

'Pol, quit muttering!'

Pollux turned to his brother. 'How can I help it?'

'They can't be lost, not really lost Why, the stereo itself would stand out on a screen like a searchlight'

Pollux thought about it 'I don't know. You remember I said I thought we might have a high-potential puncture in the power pack?'

'I thought you fixed that?'

'I planned to, just as soon as we got the bugs smoothed out in the gyros.'

Castor thought about it 'That's bad. That could be really bad.' He added suddenly, 'But quit muttering, just the same. Start thinking instead. What happened? We've got to reconstruct it'

'"What happened?" Are you kidding? Look, the pesky thing tumbles, then anything can happen. No control.'

'Use your head, I said. What would *Hazel* do in this situation?'

They both kept quiet for some moments, then Pollux said, 'Cas, that derned thing always tumbled to the left, didn't it? Always.'

'What good does that do us? Left can be any direction.'

'No! You asked what Hazel would do. She'd be along her homing line, of course - and Hazel *always* oriented around her drive line so as to get the Sun on the back of her neck, if possible. Her eyes aren't too good.'

Castor screwed up his face, trying to visualise it. 'Say Eakers' is off that way and City Hall over here; if the Sun is over on this side, then, when it tumbles, she'd vector off that way.' He acted it with his hands.

'Sure, sure! When you put in the right coordinates, that is. But what else would she do? What would *you* do? You'd vector back I mean vector home.'

'Huh? How could she? With no gyros?'

'Think about it Would you quit? Hazel is a *pilot.* She'd ride that thing like a broomstick.' He shaped the air with his hands. 'So she'd be coming back, or trying to, along here - and everybody will be looking for her way over here.'

Castor scowled. 'Could be.'

'It had better be. They'll be looking for her in a cone with its vertex at Eakers' - and they ought to be looking in a cone with its vertex right *here,* and along one side of it at that'

Castor said, 'Come along!'

'Dad said we were under arrest'

'Come along!'

City Hall was empty, save for Mrs Fries who was standing watch, red-eyed and tense, at the radio. She shook her head. 'Nothing yet.'

'Where can we find a scooter?'

'You can't Everybody is out searching.'

Castor tugged at Pollux's sleeve. 'Old Charlie.'

'Huh?' Say, Mrs Fries, is old Charlie out searching?'

'I doubt if he knows about it.'

They rushed into their suits, cycled by spilling and wasting air, did not bother with safety lines. Old Charlie let them in. 'What's all the fuss about, boys?'

Castor explained Charlie shook his head. 'That's too bad, that really is. I'm right sorry.'

'Charlie, we've got to have your scooter.'

'Right now!' added Pollux.

Charlie looked astorsished. 'Are you fooling? I'm the only one can gun that rig.'

'Charlie, this serious! We've *got* to have it'

'You couldn't gun it'

'We're both pilots.'

Charlie scratched meditatively while Castor considered slugging him for his keys - but his keys probably weren't on him - and how would one find anything in that trash pile? Charlie finally said, 'If you've just got to, I suppose I better gun it for you.'

'Okay, okay! Hurry up! Get your suit on!'

'Don't be in such a rush. It just slows you down.'

Charlie disappeared into the underbush, came out fairly promptly with a suit that seemed to consist mostly of vulcanized patches. 'Dog take it,' he complained as he began to struggle with it, 'if your mother would stay home and mind her own business, these things wouldn't happen.'

'Shut up and hurry!'

'I am hurrying. She made me take a bath. I don't need no doctors. All the bugs that ever bit me, died.'

When Charlie had dug his scooter out of the floating junkyard moored to his home they soon saw why he had refused to lend it. It seemed probable that no one else could possibly pilot it Not only was it of vintage type, repaired with parts from many other sorts, but also the controls were arranged for' a man with four hands. Charlie had been in free fall so long that he used his feet almost as readily for grasping and handling as does an ape; his space suit had had the feet thereof modified so that he could grasp things between the big toe and the second, as with Japanese stockings.

'Hang on. Where we going?'

'Do you know where the Eakers live?'

'Sure. Used to live out past that way myself. Lonely stretch.' He pointed. 'Right out there, 'bout half a degree right of that leetle second-magnitude star - say eight hundred, eight hundred ten miles.'

'Cas, maybe we'd better check the drift reports in the store?'

Charlie seemed annoyed. 'I know Rock City. I keep up with the drifts. I have to.'

'Then let's go.'

'To Eakers'?'

'No, no - uh, just about. . .' He strained his neck, figured the position of the Sun, tried to imagine himself in Hazel's suit, heading back. 'About there - would you say, Pol?'

'As near as we can guess it.'

The crate was old but Charlie had exceptionally large tanks on it; it could maintain a thrust for plenty of changeof-motion. Its jet felt as sweet as any. But it had no radar of any sort. 'Charlie, how do you tell where you are in this thing?'

'That'

'That' proved to be an antiquated radio compass loop. The twins had never seen one, knew how it worked only by theory. They were radar pilots, not used to conning by the seats of their suits. Seeing their faces Charlie added, 'Shucks, if you've got any eye for angle, you don't need fancy gear. Anywhere within twenty miles of the City Hall, I don't even turn on my suit jet - I just jump.'

They cruised out the line that the twins had picked. Once in free fall Charlie taught them how to handle the compass loop. 'Just plug it into your suit in place of your regular receiver. If you pick up a signal, swing the loop until it's least loud.

'That's the direction of the signal - an arrow right through the middle of the loop.'

'But which way? The loop faces both ways.'

'You have to know that. Or guess wrong and go back and try again.'

Castor took the first watch. He got plenty of signals; the node was buzzing with talk - all bad news. He found, too, that the loop, while not as directional as a 'salad bowl' antenna, usually did not pick up but one signal at a time. As they scooted along, endlessly he swung the loop, staying with each signal just long enough to be sure that the sound could not be Hazel.

Pollux tapped his arm and put his helmet in contact with Castor's. 'Anything?'

'Just chatter.'

'Keep trying. We'll stay out until we find them. Want me to spell you?'

'No. If we don't find them. I'm not going back.'

'Quit being a cheap hero and listen. Or give me that loop.'

City Hall dropped astern until it was no longer a shape - Castor at last reluctantly gave over the watch to Pollux. His twin had been at it for perhaps ten minutes when he suddenly made motions waving them to silence even though he could not have heard them in any case. Castor spoke to him helmet to helmet. 'What is it?'

'Sounded like a kid crying. Might have been Buster.'

'Where?'

'I've lost it I tried to get a minimum. Now I can't raise it'

Charlie, anticipating what would be needed, had swung ship as soon as he had quit accelerating. Now he blasted back as much as he had accelerated, bringing them dead in space relative to City Hall and the node. He gave it a gentle extra bump to send them cruising slowly back the way they had come. Pollux listened, slowly swinging his loop. Castor strained his eyes, trying to see something, anything, other than the cold stars.

'Got it again!' Pollux pounded his brother.

Old Charlie killed their relative motion; waited. Pollux cautiously tried for a minimum, then swung the loop, and tried again. He pointed, indicating that it had to be one of two directions, a hundred and eighty degrees apart

'Which way?' Castor asked Charlie.

'Over that way.'

'I can't see anything.'

'Me neither. I got a hunch.'

Castor did not argue. Either direction was equally likely.

Charlie gunned it hard in the direction he had picked, roughly toward Vega. He had hardly cut the gun and let it coast in free fall when Pollux was nodding vigorously. They coasted for some minutes, with Pollux reporting the signal stronger and the minimum sharper . .

. but still nothing in sight Castor longed for radar. By now he could hear crying in his own phones. It could he Buster - it *must b*e Buster.

'There she is!'

It was Charlie's shout. Castor could not see anything, even though old Charlie pointed it out to him. At last he got it - a point of light, buried in stars. Pollux unplugged from the compass when it was clear that what they saw was a mass, not a star, and in the proper direction. Old Charlie handled his craft as casually as a bicycle, bringing them up to it fast and killing his headway so that they were dead with it. He insisted on making the jump himself. Lowell was too hysterical to be coherent. Seeing that he was alive and not hurt, they turned at once to Hazel. She was still strapped in her seat, eyes open, a charateristic half-smile on her face. But she neither greeted them nor answered.

Charlie looked at her and shook his head. 'Not a chance, boys. She ain't even wearing an oxy bottle.'

Nevertheless they hooked a bottle to her suit - Castor's bottle; no one had thought to bring a spare. The twins went back cross-connected on what was left in Pollux's bottle, temporarily Siamese twins. The family scooter they left in orbit, to he picked up and towed in by someone else. Charlie used almost all his fuel on the way back, gunning as high a speed as he dared while still saving boost to brake them at City Hall.

They shouted the news all the way back. Somewhere along the line someone picked up their signal; passed it along.

They took her into Fries' store, there being more room there. Mrs Fries pushed the twins aside and applied artificial respiration herself, to be displaced ten minutes later by Dr Stone. She used the free-fall method without strapping down, placing herself behind Hazel and rhythmically squeezing her ribs with both arms.

It seemed that all of Rock City wanted to come inside. Fries chased them out, and, for the first time in history, barred the door to his store. After a while Dr Stone swapped off with her husband, then took back the task after only a few minutes' rest

Meade was weeping silently; old Charlie was wringing his hands and looking out of place and unhappy. Dr Stone worked with set face, her features hardened to masculine, professional lines. Lowell, his hand in Meade's was dry-eyed but distressed, not understanding, not yet knowing death. Castor's mouth was twisted, crying heavily as a man cries, the sobs wrung from him; Pollux, emotion already exhausted, was silent.

When Edith Stone relieved him, Roger Stone backed away, turned toward the others. His face was without anger but without hope. Pollux whispered, 'Dad? Is she?'

Roger Stone then noticed them, came over and put an arm around

Castor's heaving shoulders. 'You must remember, boy, that she is very old. They don't have much comeback at her age.'

Hazel's eyes opened. '*Who* doesn't boy?'

XIX - THE ENDLESS TRAIL

Hazel had used the ancient fakir's trick, brought to the west, so it is said, by an entertainer called Houdini, of breathing as shallowly as possible and going as quickly as may be into a coma. To hear her tell it, there never had been any real danger. Die? Shucks, you couldn't suffocate in a coffin in that length of time. Sure, she had had to depend on Lowell to keep up the cry for help; he used less oxygen. But deliberate suicide to save the boy? Ridiculous! There hadn't been any need to.

It was not until the next day that Roger Store called the boys in. He told them, 'You did a good job on the rescue. We'll forget the technical breach of confinement to the ship.'

Castor answered, 'It wasn't anything. Hazel did it, really. I mean, it was an idea that we got out of her serial, the skew orbit episode.'

'I must not have read that one.'

'Well, it was a business about how to sort out one piece of space from another when you don't have too much data to go on. You see, Captain Sterling had to -'

'Never mind. That's not what I wanted to talk with you about, you did a good job, granted, no matter what suggested it to you. If only conventional search methods had been used, your grandmother would unquestionably now be dead. You are two very intelligent men - when you take the trouble. But you didn't take the trouble soon enough. Not about the gyros.'

'But Dad, we never dreamed -'

'Enough' He reached for his waist; the twins noticed that he was wearing an old-fashioned piece of apparel - a leather belt. He took it off. 'This belonged to your great grandfather. He left it to your grandfather - who in turn left it to me. I don't know how far back it goes - but you might say that the Stone family was founded on it.' He doubled it and tried it on the palm of his hand. 'All of us, all the way back, have very tender memories of it. Very tender. Except you two.' He again whacked his palm with it.

Castor said, 'You mean you're going to beat us with that?'

'Have you any reason to offer why I shouldn't?'

Castor looked at Pollux, sighed and moved forward, I'll go first, I'm the older.'

Roger moved to a drawer, put the belt inside. 'I should have used it ten years ago.' He closed the drawer. 'It's too late, now.'

'Aren't you going to do it?'

'I never said I was going to. No.'

The twins swapped glances. Castor went on' 'Dad - Captain. We'd rather you did,'

Pollux added quickly, 'Much rather.'

'I know you would. That way you'd be through with it. But instead you're going to have to live with it. That's the way adults have to do it'

'But Dad -'

'Go to your quarters, sir.'

When it was time for the *Rolling Stone* to leave for Ceres a good proportion of the community crowded into City Hall to bid the doctor and her family good-by; all the rest were hooked in by radio, a full town meeting. Mayor Fries made a speech and presented them with a scroll which made them all honorary citizens of Rock City, now and forever; Roger Stone tried to answer and choked up. Old Charlie, freshly bathed, cried openly. Meade sang one more time into the microphone, her soft contralto unmixed this time with commercialism. Ten minutes later the *Stone* drifted out-orbit and back.

As at Mars, Roger Stone left her circum Ceres, not at a station or satellite - there was none - but in orbit. Hazel, the Captain, and Meade went down by shuttle to Ceres City, Meade to see the sights. Roger to arrange the disposal of their high grade and core material and for a cargo of refined metal to take back to Luna, Hazel to take care of business or pleasure of her own. Doctor Stone chose not to go - on Lowell's account; the shuttle was no more than an oversized scooter with bumper landing gear.

The twins were still under hatches, not allowed to go.

Meade assured them, on return, that they had not missed anything. 'It's just like Luna City, only little and crowded and no fun.'

Their father added, 'She's telling the truth, boys, so don't take it too hard. You'll be seeing Luna itself next stop anyway.

'Oh, we weren't kicking!' Castor said stiffly.

'Not a bit,' insisted Pollux. 'We're willing to wait for Luna'

Roger Stone grinned, 'You're not fooling anyone. But we will be shaping orbit home in a couple of weeks. In a way I'm sorry. All in all, it's been two good years.'

Meade said suddenly, 'Did you say "home" Daddy? It seems to me we *are* home. We're going back to Luna, but we're taking home with us.'

'Eh? Yes, I suppose you're right; the good old *Rolling Stone* is home, looked at that way. She's taken us through a lot.' He patted a bulkhead affectionately. 'Right, Mother?'

Hazel had been unusually silent. Now she looked at her son and said, 'Oh, sure, sure. Of course.'

Dr Stone said, 'What did you do downside, Mother Hazel?'

'Me? Oh, not much. Swapped lies with a couple of oldtimers. And sent off that slough episodes. By the way, Roger, better start thinking about story lines.'

'Eh? What was that, Mother?'

'That's my last. I'm giving the show back to you.'

'Well, all right - but why?'

'Uh, I'm not going to find it so convenient now.' She seemed embarrassed. 'You see - well, would any of you mind very much if I checked out now?'

'What do you mean?'

'The *Helen of Troy* is shaping for the Trojans and the *Wellington* is matching there for singleH and a passenger. Me. I'm going on out to Titan.'

Before they could object she went on, 'Now don't look at me that way. I've always wanted to see the Rings, close up - close enough to file my nails on 'em. They must be the gaudiest sight in the System. I got to thinking right seriously about it when the air was getting a little stuffy back - well, back youknow-when. I said to myself; Hazel, you aren't getting any younger; you catch the next chance that comes your way. I missed one once, Roger, when you were three. A good chance, but they wouldn't take a child and well, never mind. So now I'm going.'

She paused, then snapped, 'Don't look so much like a funeral! You don't need me now. What I mean is, Lowell is bigger now and not such a problem''

'I'll always need you, Mother Hazel,' her daughter-in-law said quietly.

'Thanks. But not true. I've taught Meade all the astrogation I know, She could get a job with Four-Planets tomorrow if they weren't so stuffy about hiring female pilots. The twins -well, they've soaked up all the meanness I can pass on to them; they'll put up a good fight, whatever comes up. And you, Son, I finished with you when you were in short pants. You've been bringing me up ever since.'

'Mother!'

'Yes, Son?'

'What's your real reason? Why do you want to go?'

'Why? Why does anybody want to go anywhere? Why did the bear go round the mountain? To see what he could see! I've never seen the Rings. That's reason enough to go anywhere. The race has been doing it for all time. The dull ones stay home - and the bright ones stir around and try to see what trouble they can dig up. It's the human pattern. It doesn't need a reason, any more than a flat cat needs a reason to buzz. Why anything?'

'When are you coming back?'

'I may never come back. I *like* free fall. Doesn't take any muscle. Take a look at old Charlie. You know how old he is? I did some checking. He's at least a hundred and sixty. That's encouraging at my age - makes me feel like a young girl. I may see quite a few things yet,'

Dr Stone said, 'Of course you will, Mother Hazel.'

Roger Stone turned to his wife. 'Edith?'

'Yes, dear?'

'What's your opinion?'

'Well . . . there's actually no reason why we should go back to Luna, not just now.'

'So I was thinking. But what about Meade?'

'Me?' said Meade.

Hazel put in drily, 'They're thinking you are about husband-high, hon.'

Dr Stone looked at her daughter and nodded slightly. Meade looked surprised, then said, 'Pooh! I'm in no hurry. Besides - there's a Patrol base on Titan. There ought to be lots of young officers.'

Hazel answered, 'It's a Patrol *research* base, hon - probably nothing but dedicated scientists.'

'Well, perhaps when I get through with them they won't be quite so dedicated!'

Roger Stone turned to the twins. 'Boys?'

Castor answerd for the team. 'Do we get a vote? Sure!'

Roger Stone grasped a stanchion, pulled himself forward. 'Then it's settled. All of you - Hazel, boys, Meade - set up trial orbits. I'll start the mass computations'

'Easy, son - count me out on that,'

'Eh?'

'Son, did you check the price they're getting for singleH here? If we are going to do a cometary for Saturn instead of a tangential for Earth, it's back to the salt mines for me. I'll radio New York for an advance, then I'll go wake Lowell and we'll start shoveling gore.'

'Well... okay. The rest of you-mind your decimals!'

All stations were manned and ready; from an instruction couch rigged back of the pilot and copilot Meade was already running down the count-off. Roger Stone glanced across at his mother and whispered, 'What are you smiling about?'

'And *five!* And *four!'* chanted Meade.

'Nothing much. After we get to Titan we might-'

The blast cut off her words; the *Stone* trembled and threw herself outward bound, toward Saturn. In her train followed hundreds and thousands and hundreds of thousands of thousands of restless rolling Stones. . . to Saturn. . . to Uranus, to Pluto. . . rolling on out to the stars. . . outward bound to the ends of the Universe.

Starman Jones

1 — THE *TOMAHAWK*

Max liked this time of day, this time of year. With the crops in, he could finish his evening chores early and be lazy. When he had slopped the hogs and fed the chickens, instead of getting supper he followed a path to a rise west of the barn and lay down in the grass, unmindful of chiggers. He had a book with him that he had drawn from the county library last Saturday, Bonforte's *Sky Beasts: A Guide to Exotic Zoology*, but he tucked it under his head as a pillow. A blue jay made remarks about his honesty, then shut up when he failed to move. A red squirrel sat on a stump and stared at him, then went on burying nuts.

Max kept his eyes to the northwest. He favored this spot because from it he could see the steel stilts and guide rings of the Chicago, Springfield, & Earthport Ring Road emerge from a slash in the ridge to his right. There was a guide ring at the mouth of the cut, a great steel hoop twenty feet high. A pair of stilt-like tripods supported another ring a hundred feet out from the cut. A third and last ring, its stilts more than a hundred feet high to keep it level with the others, lay west of him where the ground dropped still more sharply into the valley below. Half way up it he could see the power-link antenna pointing across the gap.

On his left the guides of the C.S.&E. picked up again on the far side of the gap. The entering ring was larger to allow for maximum windage deviation; on its stilts was the receptor antenna for the power link. That ridge was steeper; there was only one more ring before the road disappeared into a tunnel. He had read that, on the Moon, entrance rings were no larger than pass-along rings, since there was never any wind to cause variation in ballistic. When he was a child this entrance ring had been slightly smaller and, during an unprecedented windstorm, a train had struck the ring and produced an unbelievable wreck, with more than four hundred people killed. He had not seen it and his father had not allowed him to poke around afterwards because of the carnage, but the scar of it could still be seen on the lefthand ridge, a darker green than the rest.

He watched the trains go by whenever possible, not wishing the passengers any bad luck—but still, if there should happen to be a catastrophe, he didn't want to miss it.

Max kept his eyes fixed on the cut; the *Tomahawk* was due any instant. Suddenly there was a silver gleam, a shining cylinder with needle nose burst out of the cut, flashed through the last ring and for a breathless moment was in free trajectory between the ridges. Almost before he could swing his eyes the projectile entered the ring across the gap and disappeared into the hillside—just as the sound hit him.

It was a thunderclap that bounced around the hills. Max gasped for air. "Boy!" he said softly. "Boy, oh boy!" The incredible sight and the impact on his ears always affected him the same way. He had heard that for the passengers the train was silent, with the sound trailing them, but he did not know; he had never ridden a train and it seemed unlikely, with Maw and the farm to take care of, that he ever would.

He shifted to a sitting position and opened his book, holding it so that he would be aware of the southwestern sky. Seven minutes after the passing of the *Tomahawk* he should be able to see, on a clear evening, the launching orbit of the daily Moonship. Although much father away and much less dramatic than the nearby jump of the ring train it was this that he had come to see. Ring trains were all right, but spaceships were his love—even a dinky like the moon shuttle.

But he had just found his place, a description of the intelligent but phlegmatic crustaceans of Epsilon Ceti IV, when he was interrupted by a call behind him. "Oh, Maxie! Maximilian! Max… mil… *yan!"*

He held still and said nothing.

"*Max!* I can see you, Max—you come at once, hear me?"

He muttered to himself and got to his feet. He moved slowly down the path, watching the sky over his shoulder until the barn cut off his view. Maw was back and that was that—she'd make his life miserable if he didn't come in and help. When she had left that morning he had had the impression that she would be gone overnight—not that she had said so; she never did—but he had learned to read the signs. Now he would have to listen to her complaints and her petty gossip when he wanted to read, or just as bad, be disturbed by the slobbering stereovision serials she favored. He had often been tempted to sabotage the pesky SV set—by rights with an ax! He hardly ever got to see the programs he liked.

When he got in sight of the house he stopped suddenly. He had supposed that Maw had ridden the bus from the Corners and walked up the draw as usual. But there was a sporty little unicycle standing near the stoop—and there was someone with her.

He had thought at first it was a "foreigner"—but when he got closer he recognized the man. Max would rather have seen a foreigner, any foreigner. Biff Montgomery was a hillman but he didn't work a farm; Max couldn't remember having seen him do any honest work. He had heard it said that Montgomery sometimes hired out as a guard when one of the moonshine stills back in the hills was operating and it might be so—Montgomery was a big, beefy man and the part might fit him.

Max had known Montgomery as long as he could remember, seen him loafing around Clyde's Corners. But he had ordinarily given him "wagon room" and had had nothing to do with him—until lately: Maw had started being seen with him, even gone to barn dances and huskings with him. Max had tried to tell her that Dad wouldn't have liked it. But you couldn't argue with Maw—what she didn't like she just didn't hear.

But this was the first time she had ever brought him to the house. Max felt a slow burn of anger starting in him.

"Hurry up, Maxie!" Maw called out. "Don't stand there like a dummy." Max reluctantly moved along and joined them. Maw said, "Maxie, shake hands with your new father," then looked roguish, as if she had said something witty. Max stared and his mouth sagged open.

Montgomery grinned and stuck out a hand. "Yep, Max, you're Max Montgomery now—I'm your new pop. But you can call me Monty."

Max stared at the hand, took it briefly. "My name is Jones," he said flatly.

"Maxie!" protested Maw.

Montgomery laughed jovially. "Don't rush him, Nellie my love. Let Max get used to it. Live and let live; that's my motto." He turned to his wife. "Half a mo', while I get the baggage." From one saddlebag of the unicycle he extracted a wad of mussed clothing; from the other, two flat pint bottles. Seeing Max watching him he winked and said, "A toast for the bride."

His bride was standing by the door; he started to brush on past her. She protested, "But Monty darling, aren't you going to—"

Montgomery stopped. "Oh. I haven't much experience in these things. Sure." He turned to Max—"Here, take the baggage"—and shoved bottles and clothes at him. Then he swung her up in his arms, grunting a bit, and carried her over the threshold, put her down and kissed her while she squealed and blushed. Max silently followed them, put the items on the table and turned to the stove. It was cold, he had not used it since breakfast. There was an electric range but it had burned out before his father had died and there had never been money to repair it. He took out his pocket knife, made shavings, added kindling and touched the heap with an Everlite. When it flared up he went out to fetch a pail of water.

When he came back Montgomery said, "Wondered where you'd gone. Doesn't this dump even have running water?"

"No." Max set the pail down, then added a couple of chunks of cord wood to the fire.

His Maw said, "Maxie, you should have had dinner ready."

Montgomery interceded pleasantly with, "Now, my dear, he didn't know we were coming. And it leaves time for a toast." Max kept his back to them, giving his full attention to slicing side meat. The change was so overwhelming that he had not had time to take it in.

Montgomery called to him. "Here, son! Drink your toast to the bride."

"I've got to get supper."

"Nonsense! Here's your glass. Hurry up."

Montgomery had poured a finger of amber liquid into the glass; his own glass was half full and that of his bride at least a third. Max accepted it and went to the pail, thinned it with a dipper of water.

"You'll ruin it."

"I'm not used to it."

"Oh, well. Here's to the blushing bride—and our happy family! Bottoms up!"

Max took a cautious sip and put it down. It tasted to him like the bitter tonic the district nurse had given him one spring. He turned back to his work, only to be interrupted again. "Hey, you didn't finish it."

"Look, I got to cook. You don't want me to burn supper, do you?"

Montgomery shrugged. "Oh, well—the more for the rest of us. We'll use yours for a chaser. Sonny boy, when I was your age I could empty a tumbler neat and then stand on my hands."

Max had intended to sup on side meat and warmed-over biscuits, but there was only half a pan left of the biscuits. He scrambled eggs in the grease of the side meat, brewed coffee, and let it go at that. When they sat down Montgomery looked at it and announced, "My dear, starting tomorrow I'll expect you to live up to what you told me about your cooking. Your boy isn't much of a cook." Nevertheless he ate heartily. Max decided not to tell him that he was a better cook than Maw—he'd find out soon enough.

Presently Montgomery sat back and wiped his mouth, then poured himself more coffee and lighted a cigar. Maw said, "Maxie, dear, what's the dessert?"

"Dessert? Well—there's that ice cream in the freezer, left over from Solar Union Day."

She looked vexed. "Oh, dear! I'm afraid it's not there."

"Huh?"

"Well, I'm afraid I sort of ate it one afternoon when you were out in the south field. It was an awfully hot day."

Max did not say anything, he was unsurprised. But she was not content to leave it. "You didn't fix any dessert, Max? But this is a *special* occasion."

Montgomery took his cigar out of his mouth. "Stow it, my dear," he said kindly. "I'm not much for sweets, I'm a meat-and-potatoes man—sticks to the ribs. Let's talk of pleasanter things." He turned to Max. "Max, what can you do besides farm?"

Max was startled. "Huh? I've never done anything else. Why?"

Montgomery touched the ash of the cigar to his plate. "Because you are all through farming."

For the second time in two hours Max had more change than he could grasp. "Why? What do you mean?"

"Because we've sold the farm."

Max felt as if he had had a rug jerked out from under him. But he could tell from Maw's face that it was true. She looked the way she always did when she had put one over on him—triumphant and slightly apprehensive.

"Dad wouldn't like that," he said to her harshly. "This land has been in our family for four hundred years."

"Now, Maxie! I've told you I don't know how many times that I wasn't cut out for a farm. I was city raised."

"Clyde's Corners! Some city!"

"It wasn't a farm. And I was just a young girl when your father brought me here—you were already a big boy. I've still got my life before me. I can't live it buried on a farm."

Max raised his voice. "But you promised Dad you'd…"

"Stow it," Montgomery said firmly. "And keep a civil tongue in your head when you speak to your mother—and to me."

Max shut up.

"The land is sold and that's that. How much do you figure this parcel is worth?"

"Why, I've never thought about it."

"Whatever you thought, I got more." He gave Max a wink. "Yes, sir! It was a lucky day for your mother and you when she set her cap for me. I'm a man with his ear to the ground. I knew why an agent was around buying up these wornout, worthless pieces of property. I…"

"I use government fertilizers."

"Worthless I said and worthless I meant. For farming, that is." He put his finger along his nose, looked sly, and explained. It seemed that some big government power project was afoot for which this area had been selected—Montgomery was mysterious about it, from which Max concluded that he didn't know very much. A syndicate was quietly buying up land in anticipation of government purchase. "So we held 'em up for five times what they expected to pay. Pretty good, huh?"

Maw put in, "You see, Maxie? If your father had known that we would ever get…"

"Quiet, Nellie!"

"But I was just going to tell him how much…"

"'Quiet!' I said."

She shut up. Montgomery pushed his chair back, stuck his cigar in his mouth, and got up. Max put water on to heat for the dishes, scraped the plates and took the leavings out to the chickens. He stayed out quite a spell, looking at the stars and trying to think. The idea of having Biff Montgomery in the family shook him to his bones. He wondered just what rights a stepfather had, or, rather a step-stepfather, a man who had married his stepmother. He didn't know.

Presently he decided that he had to go back inside, much as he hated to. He found Montgomery standing at the bookshelf he had built over the stereo receiver; the man was pawing at the books and had piled several on the receiver. He looked around. "You back? Stick around, I want you to tell me about the live stock."

Maw appeared in the doorway. "Darling," she said to Montgomery, "can't that wait till morning?"

"Don't be in a hurry, my dear," he answered. "That auctioneer fellow will be here early. I've got to have the inventory ready." He continued to pull books down. "Say, these are pretty things." He held in his hands half a dozen volumes, printed on the finest of thin paper and bound in limp plastic. "I wonder what they're worth? Nellie, hand me my specs."

Max advanced hastily, reached for them. "Those are mine!"

"Huh?" Montgomery glanced at him, then held the books high in the air. "You're too young to own anything. No, everything goes. A clean sweep and a fresh start."

"They're mine! My uncle gave them to me." He appealed to his mother. "Tell him, Maw."

Montgomery said quietly, "Yes, Nellie, set this youngster straight—before I have to correct him."

Nellie looked worried. "Well, I don't rightly know. They did belong to Chet."

"And Chet was your brother? Then you're Chet's heir, not this young cub."

"He wasn't her brother, he was her brother-in-law!"

"So? No matter. Your father was your uncle's heir, then, and your mother is your father's heir. Not you, you're a minor. That's the law, son. Sorry." He put the books on the shelf but remained standing in front of them.

Max felt his right upper lip begin to twitch uncontrollably; he knew that he would not be able to talk coherently. His eyes filled with tears of rage so that he could hardly see. "You... you *thief!*"

Nellie let out a squawk. "Max!"

Montgomery's face became coldly malignant. "Now you've gone too far. I'm afraid you've earned a taste of the strap." His fingers started unbuckling his heavy belt.

Max took a step backward. Montgomery got the belt loose and took a step forward. Nellie squealed, "Monty! *Please!*"

"Keep out of this, Nellie." To Max he said, "We might as well get it settled once and for all who is boss around here. Apologize!"

Max did not answer. Montgomery repeated, "Apologize, and we'll say no more about it." He twitched the belt like a cat lashing its tail. Max took another step back; Montgomery stepped forward and grabbed at him.

Max ducked and ran out the open door into darkness. He did not stop until he was sure that Montgomery was not following. Then he caught his breath, still raging. He was almost sorry that Montgomery had not chased him; he didn't think that anyone could match him on his home grounds in the dark. He knew where the wood pile was; Montgomery didn't. He knew where the hog wallow was. Yes, he knew where the well was—even *that.*

It was a long time before he quieted down enough to think rationally. When he did, he was glad it had ended so easily, Montgomery outweighed him a lot and was reputed to be a mean one in a fight.

If it *had* ended, he corrected. He wondered if Montgomery would decide to forget it by morning. The light was still on in the living room; he took shelter in the barn and waited, sitting down on the dirt floor and leaning against the planks. After a while he felt terribly tired. He considered sleeping in the barn but there was no fit place to lie down, even though the old mule was dead. Instead he got up and looked at the house.

The light was out in the living room, but he could see a light in the bedroom; they were still awake, surely. Someone had closed the outer door after his flight; it did not lock so there was no difficulty getting in, but he was afraid that Montgomery might hear him. His own room was a shed added at the kitchen end of the main room, opposite the bedroom, but it had no outside door.

No matter—he had solved that problem when he had first grown old enough to wish to get in and out at night without consulting his elders. He crept around the house, found the saw horse, placed it under his window, got on and wiggled loose the nail that held the window. A moment later he stepped silently down into his own room.

The door to the main part of the house was closed but he decided not to risk switching on the light; Montgomery might take it into his head to come out into the living room and see a crack of light under his door. He slipped quietly out of his clothes and crawled into his cot.

Sleep wouldn't come. Once he began to feel that warm drowsiness, then some tiny noise had brought him wide, stiff awake. Probably just a mouse—but for an instant he had thought that Montgomery was standing over his bed. With his heart pounding, he sat up on the edge of his cot, still in his skin.

Presently he faced up to the problem of what he was to do—not just for the next hour, not just tomorrow morning, but the following morning and all the mornings after that. Montgomery alone presented no problem; he would not voluntarily stay in the same county with the man. But how about Maw?

His father had told him, when he had known that he was dying, "Take care of your mother, son." Well, he had done so. He had made a crop every year—food in the house and a little money, even if things had been close. When the mule died, he had made do, borrowing McAllister's team and working it out in labor.

But had Dad meant that he had to take care of his stepmother even if she remarried? It had never occurred to him to consider it. Dad had told him to look out for her and he had done so, even though it had put a stop to school and did not seem to have any end to it.

But she was no longer Mrs. Jones but Mrs. Montgomery. Had Dad meant for him to support Mrs. Montgomery?

Of course not! When a woman married, her husband supported her. Everybody knew that. And Dad wouldn't expect him to put up with Montgomery. He stood up, his mind suddenly made up.

The only question was what to take with him.

There was little to take. Groping in the dark he found the rucksack he used for hunting hikes and stuffed into it his other shirt and his socks. He added Uncle Chet's circular astrogation slide rule and the piece of volcanic glass his uncle had brought back for him from the Moon. His citizen's identification card, his toothbrush, and his father's razor—not that he needed *that* very often—about completed the plunder.

There was a loose board back of his cot. He felt for it, pulled it out and groped between the studs—found nothing. He had been hiding a little money from time to time against a rainy day, as Maw couldn't or wouldn't save. But apparently she had found it on one of her snooping tours. Well, he still had to leave; it just made it a little more difficult.

He took a deep breath. There was something he *must* get… Uncle Chet's books… and they were still (presumably) on the shelf against the wall common with the bedroom. But he *had* to get them, even at the risk of meeting Montgomery.

Cautiously, most slowly, he opened the door into the living room, stood there with sweat pouring down him. There was still a crack of light under the bedroom door and he hesitated, almost unable to force himself to go on. He heard Montgomery muttering something and Maw giggle.

As his eyes adjusted he could see by the faint light leaking out under the bedroom door something piled at the outer door. It was a deadfall alarm of pots and pans, sure to make a dreadful clatter if the door were opened. Apparently Montgomery had counted on him coming back and expected to be ready to take care of him. He was very glad that he had sneaked in the window.

No use putting it off—he crept across the floor, mindful of the squeaky board near the table. He could not see but he could feel and the volumes were known to his fingers. Carefully he slid them out, being sure not to knock over the others.

He was all the way back to his own door when he remembered the library book. He stopped in sudden panic.

He couldn't go back. They might hear him this time—or Montgomery might get up for a drink of water or something.

But in his limited horizon, the theft of a public library book—or failure to return it, which was the same thing—was, if not a mortal sin, at least high on the list of shameful crimes. He stood there, sweating and thinking about it.

Then he went back, the whole long trek, around the squeaky board and tragically onto one he had not remembered. He froze after he hit it, but apparently it had not alarmed the couple in the room beyond. At last he was leaning over the SV receiver and groping at the shelf.

Montgomery, in pawing the books, had changed their arrangement. One after another he had to take them down and try to identify it by touch, opening each and feeling for the perforations on the title page.

It was the fourth one he handled. He got back to his room hurrying slowly, unbearably anxious but afraid to move fast. There at last, he began to shake and had to wait until it wore off. He didn't chance closing his door but got into his clothes in the dark. Moments later he crept through his window, found the saw horse with his toe, and stepped quietly to the ground.

His shoes were stuffed on top of the books in his rucksack; he decided to leave them there until he was well clear of the house, rather than chance the noise he might make with his feet shod. He swung wide around the house and looked back. The bedroom light was still on; he started to angle down toward the road when he noticed Montgomery's unicycle. He stopped.

If he continued he would come to the road the bus passed along. Whether he turned right or left there, Montgomery would have a fifty-fifty chance of catching him on the unicycle. Having no money he was dependent on Shank's ponies to put distance under him; he could not take the bus.

Shucks! Montgomery wouldn't try to fetch him back. He would say good riddance and forget him!

But the thought fretted him. Suppose Maw urged him? Suppose Montgomery wouldn't forget an insult and would go to any trouble to "get even"?

He headed back, still swinging wide of the house, and cut across the slopes toward the right of way of the C.S.&E.

2 — GOOD SAMARITAN

He wished for a light, but its lack did not bother him much. He knew this country, every slope, almost every tree. He stayed high, working along the hillside, until he reached the exit ring where the trains jumped the gap, and there he came out on the road used by the ring road's maintenance crews. He sat down and put on his shoes.

The maintenance road was no more than a track cut through trees; it was suited to tractor treads but not to wheels. But it led down across the gap and up to where the ring road disappeared in the tunnel through the far ridge. He followed it, making good time in the born mountaineer's easy, loose-jointed walk.

Seventy minutes later he was across the gap and passing under the entrance ring. He went on until he was near the ring that marked the black entrance to the tunnel. He stopped at what he judged to be a safe distance and considered his chances.

The ridge was high, else the rings would have been built in a cut rather than a tunnel. He had often hunted on it and knew that it would take two hours to climb it—in daylight. But the maintenance road ran right through the hill, under the rings. If he followed it, he could go through in ten or fifteen minutes.

Max had never been through the ridge. Legally it was trespass—not that that bothered him, he was trespassing now. Occasionally a hog or a wild animal would wander into the tunnel and be trapped there when a train hurtled through. They died, instantly and without a scratch. Once Max had spotted the carcass of a fox just inside the tunnel and had ducked in and salvaged it. There were no marks on it, but when he skinned it he found that it was a mass of tiny hemorrhages. Several years earlier a man had been caught inside; the maintenance crew brought out the body.

The tunnel was larger than the rings but no larger than necessary to permit the projectile to ride ahead of its own reflected shock wave. Anything alive in the tunnel could not avoid the wave; that unbearable thunderclap, painful at a distance, was so loaded with energy as to be quick death close up.

But Max did not want to climb the ridge; he went over the evening schedule of trains in his mind. The *Tomahawk* was the one he had watched at sundown; the *Javelin* he had heard while he was hiding in the barn. The *Assegai* must have gone by quite a while ago though he didn't remember hearing it; that left only the midnight *Cleaver*. He then looked at the sky.

Venus had set, of course, but he was surprised to see Mars still in the west. The Moon had not risen. Let's see—full moon was last Wednesday. Surely…

The answer he got seemed wrong, so he checked himself by taking a careful eyesight of Vega and compared it with what the Big Dipper told him. Then he whistled softly—despite everything that had happened it was only ten o'clock, give or take five minutes; the stars could not be wrong. In which case the *Assegai* was not due for another three-quarters of an hour. Except for the faint chance of a special train he had plenty of time.

He headed into the tunnel. He had not gone fifty yards before he began to be sorry and a bit panicky; it was as dark as a sealed coffin. But the going was much easier as the bore was lined to permit smooth shockwave reflections. He had been on his way several minutes, feeling each step but hurrying, when his eyes, adjusting to complete darkness, made out a faint grey circle far ahead. He broke into a trot and then into a dead run as his fear of the place piled up.

He reached the far end with throat burned dry and heart laboring; there he plunged downhill regardless of the sudden roughening of his path as he left the tunnel and hit the maintenance track. He did not slow up until he stood under stilt supports so high that the ring above looked small. There he stood still and fought to catch his breath.

He was slammed forward and knocked off his feet.

He picked himself up groggily, eventually remembered where he was and realized that he had been knocked cold. There was blood on one cheek and his hands and elbows were raw. It was not until he noticed these that he realized what had happened; a train had passed right over him.

It had not been close enough to kill, but it had been close enough to blast him off his feet. It could not have been the *Assegai*; he looked again at the stars and confirmed it. No, it must have been a special—and he had beaten it out of the tunnel by about a minute.

He began to shake and it was minutes before he pulled himself together, after which he started down the maintenance road as fast as his bruised body could manage. Presently he became aware of an odd fact; the night was silent.

But night is never silent. His ears, tuned from babyhood to the sounds and signs of his hills, should have heard an endless pattern of little night noises—wind in the leaves, the scurrying of his small cousins, tree frogs, calls of insects, owls.

By brutal logic he concluded correctly that he could not hear —"deef as a post"—the shock wave had left him deaf. But there was no way to help it, so he went on; it did not occur to him to return home. At the bottom of this draw, where the stilts were nearly three hundred feet high, the maintenance road crossed a farm road. He turned down hill onto it, having accomplished his first purpose of getting into territory where Montgomery would be less likely to look for him. He was in another watershed now; although still only a few miles from home, nevertheless by going through the ridge he had put himself into a different neighborhood.

He continued downhill for a couple of hours. The road was hardly more than a cart track but it was easier than the maintenance road. Somewhere below, when the hills gave way to the valley where the "foreigners" lived, he would find the freight highway that paralleled the ring road on the route to Earthport—Earthport being his destination although he had only foggy plans as to what he would do when he got there.

The Moon was behind him now and he made good time. A rabbit hopped onto the road ahead, sat up and stared, then skittered away. Seeing it, he regretted not having brought along his squirrel gun. Sure, it was worn out and not worth much and lately it had gotten harder and harder to buy the slugs thrown by the obsolete little weapon—but rabbit in the pot right now would go mighty nice, mighty nice! He realized that he was not only weary but terribly hungry. He had just picked at his supper and it looked like he'd breakfast on his upper lip.

Shortly his attention was distracted from hunger to a ringing in his ears, a ringing that got distressingly worse. He shook his head and pounded his ears but it did not help; he had to make up his mind to ignore it. After another half mile or so he suddenly noticed that he could hear himself walking. He stopped dead, then clapped his hands together. He could hear them smack, cutting through the phantom ringing. With a lighter heart he went on.

At last he came out on a shoulder that overlooked the broad valley. In the moonlight he could make out the sweep of the freight highway leading southwest and could detect, he thought, its fluorescent traffic guide lines. He hurried on down.

He was nearing the highway and could hear the rush of passing freighters when he spotted a light ahead. He approached it cautiously, determined that it was neither vehicle nor farm house. Closer approach showed it to be a small open fire, visible from uphill but shielded from the highway by a shoulder of limestone. A man was squatting over it, stirring the contents of a can resting on rocks over the fire.

Max crept nearer until he was looking down into the hobo jungle. He got a whiff of the stew and his mouth watered. Caught between hunger and a hillman's ingrown distrust of "foreigners" he lay still and stared. Presently the man set the can off the fire and called out, "Well, don't hide there! Come on down."

Max was too startled to answer. The man added, "Come on down into the light. I won't fetch it up to you."

Max got to his feet and shuffled down into the circle of firelight. The man looked up. "Howdy. Draw up a chair."

"Howdy." Max sat down across the fire from the tramp. He was not even as well dressed as Max and he needed a shave. Nevertheless he wore his rags with a jaunty air and handled himself with a sparrow's cockiness.

The man continued to stir the mess in the can then spooned out a sample, blew on it, and tasted it. "About right," he announced. "Four-day mulligan, just getting ripe. Find yourself a dish." He got up and picked over a pile of smaller cans behind him, selected one. Max hesitated, then did the same, settling on one that had once contained coffee and appeared not to have been used since. His host served him a liberal portion of stew, then handed him a spoon. Max looked at it.

"If you don't trust the last man who used it," the man said reasonably, "hold it in the fire, then wipe it. Me, I don't worry. If a bug bites me, he dies horribly." Max took the advice, holding the spoon in the flames until the handle became too hot, then wiped it on his shirt.

The stew was good and his hunger made it superlative. The gravy was thick, there were vegetables and unidentified meat. Max didn't bother his head about the pedigrees of the materials; he simply enjoyed it. After a while his host said, "Seconds?"

"Huh? Sure. Thanks!"

The second can of stew filled him up and spread through his tissues a warm glow of wellbeing. He stretched lazily, enjoying his fatigue. "Feel better?" the man asked.

"Gee, yes. Thanks."

"By the way, you can call me Sam."

"Oh, my name is Max."

"Glad to know you, Max."

Max waited before raising a point that had been bothering him.

"Uh, Sam? How did you know I was there? Did you hear me?"

Sam grinned. "No. But you were silhouetted against the sky. Don't ever do that, kid, or it may be the last thing you do."

Max twisted around and looked up at where he had lurked. Sure enough, Sam was right. He'd be dogged!

Sam added, "Traveled far?"

"Huh? Yeah, quite a piece."

"Going far?"

"Uh, pretty far, I guess."

Sam waited, then said, "Think your folks'll miss you?"

"Huh? How did you know?"

"That you had run away from home? Well, you have, haven't you?"

"Yeah. Yeah, I guess I have."

"You looked beat when you dragged in here. Maybe it's not too late to kill the goose before your bridges are burned. Think about it, kid. It's rough on the road. I know."

"Go back? I won't ever go back!"

"As bad as that?"

Max stared into the fire. He needed badly to get his thoughts straight, even if it meant telling a foreigner his private affairs—and this soft-spoken stranger was easy to talk to. "See here, Sam, did you ever have a stepmother?"

"Eh? Can't remember that I ever had any. The Central Jersey Development Center for State Children used to kiss me good night."

"Oh." Max blurted out his story with an occasional sympathetic question from Sam to straighten out its confusion. "So I lit out," he concluded. "There wasn't anything else to do. Was there?"

Sam pursed his lips. "I reckon not. This double stepfather of yours—he sounds like a mouse studying to be a rat. You're well shut of him."

"You don't think they'll try to find me and haul me back, do you?"

Sam stopped to put a piece of wood on the fire. "I am not sure about that."

"Huh? Why not? I'm no use to him. He doesn't like me. And Maw won't care, not really. She may whine a bit, but she won't turn her hand."

"Well, there's the farm."

"The farm? I don't care about that, not with Dad gone. Truthfully, it ain't much. You break your back trying to make a crop. If the Food Conservation Act hadn't forbidden owners to let farm land fall out of use, Dad would have quit farming long ago. It would take something like this government condemnation to make it possible to find anybody to take it off your hands."

"That's what I mean. This joker got your mother to sell it. Now my brand of law may not be much good, but it looks as if that money ought to come to you."

"What? Oh, I don't care about the money. I just want to get away from them."

"Don't talk that way about money; the powers-that-be will have you shut up for blasphemy. But it probably doesn't matter how you feel, as I think Citizen Montgomery is going to want to see you awful bad."

"Why?"

"Did your father leave a will?"

"No. Why? He didn't have anything to leave but the farm."

"I don't know the ins and outs of your state laws, but it's a sure thing that at least half of that farm belongs to you. Possibly your stepmother has only lifetime tenure in her half, with reversion to you when she dies. But it's a certainty that she can't grant a good deed without your signature. Along about time your county courthouse opens up tomorrow morning the buyers are going to find that out. Then they'll come hightailing up, looking for her—and you. And ten minutes later this Montgomery hombre will start looking for you, if he hasn't already."

"Oh, me! If they find me, can they make me go back?"

"Don't let them find you. You've made a good start."

Max picked up his rucksack. "I guess I had better get moving. Thanks a lot, Sam. Maybe I can help you someday."

"Sit down."

"Look, I had better get as far away as I can."

"Kid, you're tired out and your judgment has slipped. How far can you walk tonight, the shape you're in? Tomorrow morning, bright and early, we'll go down to the highway, follow it about a mile to the freighters' restaurant south of here and catch the haulers as they come out from breakfast, feeling good. We'll promote a ride and you'll go farther in ten minutes than you could make all night."

Max had to admit that he was tired, exhausted really, and Sam certainly knew more about these wrinkles than he did. Sam added, "Got a blanket in your bindle?"

"No. Just a shirt… and some books."

"Books, eh? Read quite a bit myself, when I get a chance. May I see them?"

Somewhat reluctantly Max got them out. Sam held them close to the fire and examined them. "Well, I'll be a three-eyed Martian! Kid, do you know what you've got here?"

"Sure."

"But you ought not to have these. You're not a member of the Astrogators' Guild."

"No, but my uncle was. He was on the first trip to Beta Hydrae," he added proudly.

"No foolin'!"

"Sure as taxes."

"But you've never been in space yourself? No, of course not."

"But I'm going to be!" Max admitted something that he had never told anyone, his ambition to emulate his uncle and go out to the stars. Sam listened thoughtfully. When Max stopped, he said slowly, "So you want to be an astrogator?"

"I certainly do."

Sam scratched his nose. "Look, kid, I don't want to throw cold water, but you know how the world wags. Getting to be an astrogator is almost as difficult as getting into the Plumbers' Guild. The soup is thin these days and there isn't enough to go around. The guild won't welcome you just because you are anxious to be apprenticed. Membership is hereditary, just like all the other high-pay guilds."

"But my uncle was a member."

"Your uncle isn't your father."

"No, but a member who hasn't any sons gets to nominate someone else. Uncle Chet explained it to me. He always told me he was going to register my nomination."

"And did he?"

Max was silent. At the time his uncle had died he had been too young to know how to go about finding out. When his father had followed his uncle events had closed in on him—he had never checked up, subconsciously preferring to nurse the dream rather than test it. "I don't know," he said at last. "I'm going to the Mother Chapter at Earthport and find out."

"Hmmm—I wish you luck, kid." He stared into the fire, sadly it seemed to Max. "Well, I'm going to grab some shuteye, and you had better do the same. If you're chilly, you'll find some truck back under that rock shelf—burlap and packing materials and such. It'll keep you warm, if you don't mind risking a flea or two."

Max crawled into the dark hole indicated, found a halfway cave in the limestone. Groping, he located the primitive bedding. He had expected to be wakeful, but he was asleep before Sam finished covering the fire.

He was awakened by sunlight blazing outside. He crawled out, stood up and stretched the stiffness out of his limbs. By the sun he judged it to be about seven o'clock in the morning. Sam was not in sight. He looked around and shouted, not too loudly, and guessed that Sam had gone down to the creek for a drink and a cold wash. Max went back into the shelter and hauled out his rucksack, intending to change his socks.

His uncle's books were missing.

There was a note on top of his spare shirt: "Dear Max," it said, "There is more stew in the can. You can warm it up for breakfast. So long—Sam P.S. Sorry."

Further search disclosed that his identification card was missing, but Sam had not bothered with his other pitiful possessions. Max did not touch the stew but set out down the road, his mind filled with bitter thoughts.

3 — EARTHPORT

The farm road crossed under the freight highway; Max came up on the far side and headed south beside the highway. The route was marked by "NO TRESPASS" signs but the path was well worn. The highway widened to make room for a deceleration strip. At the end of its smooth reach, a mile away, Max could see the restaurant Sam had mentioned.

He shinnied over the fence enclosing the restaurant and parking grounds and went to the parking stalls where a dozen of the big land ships were lined up. One was quivering for departure, its flat bottom a few inches clear of the metallic pavement. Max went to its front end and looked up at the driver's compartment. The door was open and he could see the driver at his instrument board. Max called out, "Hey, Mister!"

The driver stuck his head out. "What's itching you?"

"How are the chances of a lift south?"

"Beat it, kid." The door slammed.

None of the other freighters was raised off the pavement; their control compartments were empty. Max was about to turn away when another giant scooted down the braking strip, reached the parking space, crawled slowly into a stall, and settled to the ground. He considered approaching its driver, but decided to wait until the man had eaten. He went back toward the restaurant building and was looking through the door, watching hungry men demolish food while his mouth watered, when he heard a pleasant voice at his shoulder.

"Excuse me, but you're blocking the door."

Max jumped aside. "Oh! Sorry."

"Go ahead. You were first." The speaker was a man about ten years older than Max. He was profusely freckled and had a onesided grin. Max saw on his cap the pin of the Teamsters' Guild. "Go on in," the man repeated, "before you get trampled in the rush."

Max had been telling himself that he might catch Sam inside—and, after all, they couldn't charge him just for coming in, if he didn't actually *eat* anything. Underlying was the thought of asking to work for a meal, if the manager looked friendly. The freckled-faced man's urging tipped the scales; he followed his nose toward the source of the heavenly odors pouring out the door.

The restaurant was crowded; there was one vacant table, for two. The man slid into a chair and said, "Sit down." When Max hesitated, he added, "Go ahead, put it down. Never like to eat alone." Max could feel the manager's eyes on him, he sat down. A waitress handed them each a menu and the hauler looked her over appreciatively. When she left he said, "This dump used to have automatic service—and it went broke. The trade went to the *Tivoli*, eighty miles down the stretch. Then the new owner threw away the machinery and hired girls and business picked up. Nothing makes food taste better than having a pretty girl put it in front of you. Right?"

"Uh, I guess so. Sure." Max had not heard what was said. He had seldom been in a restaurant and then only in the lunch counter at Clyde's Corners. The prices he read frightened him; he wanted to crawl under the table.

His companion looked at him. "What's the trouble, chum?"

"Trouble? Uh, nothing."

"You broke?" Max's miserable expression answered him. "Shucks, I've been there myself. Relax." The man waggled his fingers at the waitress. "Come here, honey chile. My partner and I will each have a breakfast steak with a fried egg sitting on top and this and that on the side. I want that egg to be just barely dead. If it is cooked solid, I'll nail it to the wall as a warning to others. Understand me?"

"I doubt if you'll be able to get a nail through it," she retorted and walked away, swaying gently. The hauler kept his eyes on her until she disappeared into the kitchen. "See what I mean? How can machinery compete?"

The steak was good and the egg was not congealed. The hauler told Max to call him "Red" and Max gave his name in exchange. Max was pursuing the last of the yolk with a bit of toast and was considering whether it was time to broach the subject of a ride when Red leaned forward and spoke softly. "Max—you got anything pushing you? Free to take a job?"

"What? Why, maybe. What is it?"

"Mind taking a little run southwest?"

"Southwest? Matter of fact, I was headin' that way."

"Good. Here's the deal. The Man says we have to have two teamsters to each rig—or else break for eight hours after driving eight. I can't; I've got a penalty time to meet—and my partner washed out. The flathead got taken drunk and I had to put him down to cool. Now

I've got a check point to pass a hundred thirty miles down the stretch. They'll make me lay over if I can't show another driver."

"Gee! But I don't know how to drive, Red. I'm awful sorry."

Red gestured with his cup. "You won't have to. You'll always be the offwatch driver. I wouldn't trust little *Molly Malone* to somebody who didn't know her ways. I'll keep myself awake with Pep pills and catch up on sleep at Earthport."

"You're going all the way to *Earthport?*"

"Right."

"It's a deal!"

"Okay, here's the lash up. Every time we hit a check point you're in the bunk, asleep. You help me load and unload—I've got a partial and a pick-up at Oke City—and I'll feed you. Right?"

"Right!"

"Then let's go. I want to scoot before these other dust jumpers get underway. Never can tell, there might be a spotter." Red flipped a bill down and did not wait for change.

The *Molly Malone* was two hundred feet long and stream lined such that she had negative lift when cruising. This came to Max's attention from watching the instruments; when she first quivered and raised, the dial marked ROAD CLEARANCE showed nine inches, but as they gathered speed down the acceleration strip it decreased to six.

"The repulsion works by an inverse-cube law," Red explained. "The more the wind pushes us down the harder the road pushes us up. Keeps us from jumping over the skyline. The faster we go the steadier we are."

"Suppose you went so fast that the wind pressure forced the bottom down to the road? Could you stop soon enough to keep from wrecking it?"

"Use your head. The more we squat the harder we are pushed up—inverse-cube, I said."

"Oh." Max got out his uncle's slide rule. "If she just supports her own weight at nine inches clearance, then at three inches the repulsion would be twenty-seven times her weight and at an inch it would be seven hundred and twenty-nine, and at a quarter of an inch —"

"Don't even think about it. At top speed I can't get her down to five inches."

"But what makes her go?"

"It's a phase relationship. The field crawls forward and Molly tries to catch up—only she can't. Don't ask me the theory, I just push the buttons." Red struck a cigarette and lounged back, one hand on the tiller. "Better get in the bunk, kid. Check point in forty miles."

The bunk was thwartships abaft the control compartment, a shelf above the seat. Max climbed in and wrapped a blanket around himself. Red handed him a cap. "Pull this down over your eyes. Let the button show." The button was a teamster's shield, Max did as he was told.

Presently he heard the sound of wind change from a soft roar to a sigh and then stop. The freighter settled to the pavement and the door opened. He lay still, unable to see what was going on. A strange voice said, "How long you been herding it?"

"Since breakfast at Tony's."

"So? How did your eyes get so bloodshot?"

"It's the evil life I lead. Want to see my tongue?"

The inspector ignored this, saying instead, "Your partner didn't sign his trick."

"Whatever you say. Want me to wake the dumb geek?"

"Umm… don't bother. You sign for him. Tell him to be more careful."

"Right."

The *Molly Malone* pulled out and picked up speed. Max crawled down. "I thought we were sunk when he asked for my signature."

"That was on purpose," Red said scornfully. "You have to give them something to yap about, or they'll dig for it."

Max liked the freighter. The tremendous speed so close to the ground exhilarated him; he decided that if he could not be a spaceman, this life would not be bad—he'd find out how high the application fee was and start saving. He liked the easy way Red picked out on the pavement ahead the speed line that matched the *Molly's* speed and then laid the big craft into a curve. It was usually the outermost line, with the *Molly* on her side and the horizon tilted up at a crazy angle.

Near Oklahoma City they swooped under the ring guides of the C.S.&E. just as a train went over—the *Razor*, by Max's calculations. "I used to herd those things," Red remarked, glancing up.

"You *did*?"

"Yep. But they got to worrying me. I hated it every time I made a jump and felt the weight sag out from under me. Then I got a notion that the train had a mind of its own and was just waiting to turn aside instead of entering the next guide ring. That sort of thing is no good. So I found a teamster who wanted to better himself and paid the fine to both guilds to let us swap. Never regretted it. Two hundred miles an hour when you're close to the ground is enough."

"Uh, how about space ships?"

"That's another matter. Elbow room out there. Say, kid, while you're at Earthport you should take a look at the big babies. They're quite something."

The library book had been burning a hole in his rucksack; at Oklahoma City he noticed a postal box at the freight depot and, on impulse, dropped the book into it. After he had mailed it he had a twinge of worry that he might have given a clue to his whereabouts which would get back to Montgomery, but he suppressed the worry—the book *had* to be returned. Vagrancy in the eyes of the law had not worried him, nor trespass, nor impersonating a licensed teamster—but filching a book was a sin.

Max was asleep in the bunk when they arrived. Red shook him. "End of the line, kid."

Max sat up, yawning. "Where are we?"

"Earthport. Let's shake a leg and get this baby unloaded."

It was two hours past sunrise and growing desert hot by the time they got the *Molly* disgorged. Red stood him to a last meal. Red finished first, paid, then laid a bill down by Max's plate. "Thanks, kid. That's for luck. So long." He was gone while Max still had his mouth hanging open. He had never learned his friend's name, did not even know his shield number.

Earthport was much the biggest settlement Max had ever seen and everything about it confused him—the hurrying self-centered crowds, the enormous buildings, the slidewalks in place of streets, the noise, the desert sun beating down, the flatness—why, there wasn't anything you could call a hill closer than the skyline!

He saw his first extraterrestrial, an eight-foot native of Epsilon Gemini V, striding out of a shop with a package under his left arms—as casually, Max thought, as a farmer doing his week's shopping at the Corners. Max stared. He knew what the creature was from pictures and SV shows, but seeing one was another matter. Its multiple eyes, like a wreath of yellow grapes around the head, gave it a grotesque faceless appearance. Max let his own head swivel to follow it.

The creature approached a policeman, tapped the top of his cap, and said, "Excuse me, sahr, but can you tirect me to the Tesert Palms Athletic Club?" Max could not tell where the noise came out.

Max finally noticed that he seemed to be the only one staring, so he walked slowly on, while sneaking looks over his shoulder—which resulted in his bumping into a stranger. "Oh, excuse me!" Max blurted. The stranger looked at him. "Take it easy, cousin. You're in the big city now." After that he tried to be careful.

He had intended to seek out the Guild Hall of the Mother Chapter of Astrogators at once in the forlorn hope that even without his books and identification card he might still identify himself and find that Uncle Chet had provided for his future. But there was so much to see that he loitered. He found himself presently in front of Imperial House, the hotel that guaranteed to supply any combination of pressure, temperature, lighting, atmosphere, pseudogravitation, and diet favored by any known race of intelligent creatures. He hung around hoping to see some of the guests, but the only one who came out while he was there was wheeled out in a pressurized travel tank and he could not see into it.

He noticed the police guard at the door eyeing him and started to move on—then decided to ask directions, reasoning that if it was all right for a Geminian to question a policeman it certainly must be all right for a human being. He found himself quoting the extraterrestrial. "Excuse me, sir, but could you direct me to the Astrogators' Guild Hall?"

The officer looked him over. "At the foot of the Avenue of Planets, just before you reach the port."

"Uh, which way do..."

"New in town?"

"Yeah. Yes, sir."

"Where are you staying?"

"Staying? Why, nowhere yet. I just got here. I..."

"What's your business at the Astrogators' Hall?"

"It's on account of my uncle," Max answered miserably.

"Your uncle?"

"He... he's an astrogator." He mentally crossed his fingers over the tense.

The policeman inspected again. "Take this slide to the next intersection, change and slide west. Big building with the guild sunburst over the door—can't miss it. Stay out of restricted areas." Max left without waiting to find out how he was to know a restricted area. The Guild Hall did prove easy to find; the slidewalk to the west ducked underground and when it emerged at its swing-around Max was deposited in front of it.

But he had not eyes for it. To the west where avenue and buildings ended was the field and on it space ships, stretching away for miles—fast little military darts, stubby Moon shuttles, winged ships that served the satellite stations, robot freighters, graceless and powerful. But directly in front of the gate hardly half a mile away was a great ship that he knew at once, the starship *Asgard*. He knew her history, Uncle Chet had served in her. A hundred years earlier she had been built out in space as a space-to-space rocket ship; she was then the *Prince of Wales*. Years passed, her tubes were ripped out and a mass-conversion torch was kindled in her; she became the *Einstein*. More years passed, for nearly twenty she swung empty around Luna, a lifeless, outmoded hulk. Now in place of the torch she had Horst-Conrad impellers that clutched at the fabric of space itself; thanks to them she was now able to touch Mother Terra. To commemorate her rebirth she had been dubbed *Asgard*, heavenly home of the gods.

Her massive, pear-shaped body was poised on its smaller end, steadied by an invisible scaffolding of thrust beams. Max knew where they must be, for there was a ring of barricades spotted around her to keep the careless from wandering into the deadly loci.

He pressed his nose against the gate to the field and tried to see more of her, until a voice called out, "Away from there, Jack! Don't you see that sign?"

Max looked up. Above his head was a sign: RESTRICTED AREA. Reluctantly he moved away and walked back to the Guild Hall.

4 — THE ASTROGATORS' GUILD

Everything about the hall of the Mother Chapter was to Max's eyes lavish, churchlike, and frightening. The great doors opened silently as he approached, dilating away into the walls. His feet made no sound on the tesselated floor. He started down the long, high foyer, wondering where he should go, when a firm voice stopped him. "May I help you, please?"

He turned. A beautiful young lady with a severe manner held him with her eye. She was seated behind a desk. Max went up to her. "Uh, maybe you could tell me, Ma'am, who I ought to see. I don't rightly know just..."

"One moment. Your name, please?" Several minutes later she had wormed out of him the basic facts of his quest. "So far as I can see, you haven't any status here and no excuse for appealing to the Guild."

"But I told you..."

"Never mind. I'm going to put it up to the legal office." She touched a button and a screen raised up on her desk; she spoke to it. "Mr. Hanson, can you spare a moment?"

"Yes, Grace?"

"There is a young man here who claims to be a legacy of the Guild. Will you talk with him?"

The voice answered, "Look, Grace, you know the procedures. Get his address, send him on his way, and send his papers up for consideration."

She frowned and touched another control. Although Max could see that she continued to talk, no sound reached him. Then she nodded and the screen slid back into the desk. She touched another button and said, "Skeeter!"

A page boy popped out of a door behind her and looked Max over with cold eyes. "Skeeter," she went on, "take this visitor to Mr. Hanson."

The page sniffed. "Him?"

"Him. And fasten your collar and spit out that gum."

Mr. Hanson listened to Max's story and passed him on to his boss, the chief legal counsel, who listened to a third telling. That official then drummed his desk and made a call, using the silencing device the girl had used.

He then said to Max, "You're in luck, son. The Most Worthy High Secretary will grant you a few minutes of his time. Now when you go in, don't sit down, remember to speak only when spoken to, and get out quickly when he indicates that the audience is ended."

The High Secretary's office made the lavishness that had thus far filled Max's eyes seem like austerity. The rug alone could have been swapped for the farm on which Max grew up. There was no communication equipment in evidence, no files, not even a desk. The High Secretary lounged back in a mammoth easy chair while a servant massaged his scalp. He raised his head as Max appeared and said, "Come in, son. Sit down there. What is your name?"

"Maximilian Jones, sir."

They looked at each other. The Secretary saw a lanky youth who needed a haircut, a bath, and a change of clothes; Max saw a short, fat little man in a wrinkled uniform. His head seemed too big for him and Max could not make up his mind whether the eyes were kindly or cold.

"And you are a nephew of Chester Arthur Jones?"

"Yes, sir."

"I knew Brother Jones well. A fine mathematician." The High Secretary went on, "I understand that you have had the misfortune to lose your government Citizen's Identification. Carl."

He had not raised his voice but a young man appeared with the speed of a genie. "Yes, sir?"

"Take this young man's thumb print, call the Bureau of Identification—not here, but the main office at New Washington. My compliments to the Chief of Bureau and tell him that I would be pleased to have immediate identification while you hold the circuit."

The print was taken speedily; the man called Carl left. The High Secretary went on, "What was your purpose in coming here?" Diffidently Max explained that his uncle had told him that he intended to nominate him for apprenticeship in the guild.

The man nodded. "So I understand. I am sorry to tell you, young fellow, that Brother Jones made no nomination."

Max had difficulty in taking in the simple statement. So much was his inner pride tied to his pride in his uncle's profession, so much had he depended on his hope that his uncle had named him his professional heir, that he could not accept at once the verdict that he was nobody and nothing. He blurted out, "You're *sure?* Did you look?"

The masseur looked shocked but the High Secretary answered calmly, "The archives have been searched, not once, but twice. There is no possible doubt." The High Secretary sat up, gestured slightly, and the servant disappeared. "I'm sorry."

"But he *told* me," Max said stubbornly. "He said he was going to."

"Nevertheless he did not." The man who had taken the thumb print came in and offered a memorandum to the High Secretary, who glanced at it and waved it away. "I've no doubt that he considered you. Nomination to our brotherhood involves a grave responsibility; it is not unusual for a childless brother to have his eye on a likely lad for a long time before deciding whether or not he measures up. For some reason your uncle did not name you."

Max was appalled by the humiliating theory that his beloved uncle might have found him unworthy. It could not be true—why, just the day before he died, he had said—he interrupted his thoughts to say, "Sir—I think I know what happened."

"Eh?"

"Uncle Chester died suddenly. He meant to name me, but he didn't get a chance. I'm sure of it."

"Possibly. Men have been known to fail to get their affairs in order before the last orbit. But I must assume that he knew what he was doing."

"But—"

"That's all, young man. No, don't go away. I've been thinking about you today." Max looked startled, the High Secretary smiled and continued, "You see, you are the second 'Maximilian Jones' who has come to us with this story."

"Huh?"

"Huh indeed." The guild executive reached into a pocket of his chair, pulled out some books and a card, handed them to Max, who stared unbelievingly.

"Uncle Chet's books!"

"Yes. Another man, older than yourself, came here yesterday with your identification card and these books. He was less ambitious than you are," he added dryly. "He was willing to settle for a rating less lofty than astrogator."

"What happened?"

"He left suddenly when we attempted to take his finger prints. I did not see him. But when you showed up today I began to wonder how long a procession of 'Maximilian Jones's' would favor us. Better guard that card in the future—I fancy we have saved you a fine."

Max placed it in an inner pocket. "Thanks a lot, sir." He started to put the books in his rucksack. The High Secretary gestured in denial.

"No, no! Return the books, please."

"But Uncle Chet gave them to me."

"Sorry. At most he loaned them to you—and he should not have done even that. The tools of our profession are never owned individually; they are loaned to each brother. Your uncle should have turned them in when he retired, but some of the brothers have a sentimental fondness for having them in their possession. Give them to me, please."

Max still hesitated. "Come now," the guildsman said reasonably. "It would not do for our professional secrets to be floating around loose, available to anyone. Even the hairdressers do not permit that. We have a high responsibility to the public. Only a member of this guild, trained, tested, sworn, and accepted, may lawfully be custodian of those manuals."

Max's answer was barely audible. "I don't see the harm. I'm not going to get to use them, it looks like."

"You don't believe in anarchy, surely? Our whole society is founded on entrusting grave secrets only to those who are worthy. But don't feel sad. Each brother, when he is issued his tools, deposits an earnest with the bursar. In my opinion, since you are the nearest relative of Brother Jones, we may properly repay the earnest to you for their return. Carl."

The young man appeared again. "The deposit monies, please." Carl had the money with him—he seemed to earn his living by knowing what the High Secretary was about to want. Max found himself accepting an impressive sheaf of money, more than he had ever touched before, and the books were taken from him before he could think of another objection.

It seemed time to leave, but he was motioned back to his chair. "Personally, I am sorry to disappoint you, but I am merely the servant of my brothers; I have no choice. However… " The High Secretary fitted his finger tips together. "Our brotherhood takes care of its own.

There are funds at my disposal for such cases. How would you like to go into training?"

"For the *Guild?*"

"No, no! We don't grant brotherhood as charity. But for some respectable trade, metalsmith, or chef, or tailor—what you wish. Any occupation not hereditary. The brotherhood will sponsor you, pay your 'prentice fee and, if you make good, lend you your contribution when you are sworn in."

Max knew he should accept gratefully. He was being offered an opportunity free that most of the swarming masses never got on any terms. But the cross-grained quirk in him that had caused him to spurn the stew that Sam had left behind made this generous offer stick in his craw. "Thanks just the same," he answered in tones almost surly, "but I don't rightly think I can take it."

The High Secretary looked bleak. "So? It's your life." He snapped his fingers, a page appeared, and Max was led quickly out of the Hall.

He stood on the steps of the Guild Hall and wondered dejectedly what he should do next. Even the space ships on the field at the foot of the street did not attract; he could not have looked at one without feeling like crying. He looked to the east instead.

A short distance away a jaunty figure leaned against a trash receptacle. As Max's eyes rested on the man he straightened up, flipped a cigarette to the pavement, and started toward him.

Max looked at him again. "Sam!" It was undoubtedly the wayfarer who had robbed him—well dressed, clean shaved—but Sam nonetheless. Max hurried toward him.

"Howdy, Max," Sam greeted him with an unembarrassed grin, "how did you make out?"

"I ought to have you arrested!"

"Now, now—keep your voice down. You're making yourself conspicuous."

Max took a breath and lowered his voice. "You stole my books."

"*Your* books? They weren't yours—and I returned them to their owners. You want to arrest me for that?"

"But you… Well, anyhow you…"

A voice, civil, firm, and official, spoke at Max's elbow. "Is this person annoying you, sir?" Max turned and found a policeman standing behind him. He started to speak, then bit off the words as he realized the question had been addressed to Sam.

Sam took hold of Max's upper arm in a gesture that was protective and paternal, but quite firm. "Not at all, officer, thank you."

"Are you sure? I received word that this chico was headed this way and I've had my eye on him."

"He's a friend of mine. I was waiting for him here."

"As you say. We have a lot of trouble with vagrants. They all seem to head for Earthport."

"He's not a vagrant. He's a young friend of mine from the country and I'm afraid he's gotten a bit confused. I'll be responsible."

"Very well, sir."

"Not at all." Max let himself be led away. When they were out of earshot Sam said, "That was close. That nosy clown would have had us both in the bull pen. You did all right, kid—kept your lip zipped at the right time."

They were around the corner into a less important street before Sam let go his grip. He stopped and faced Max, grinning. "Well, kid?"

"I should a' told that cop about you!"

"Why didn't you? He was right there."

Max found himself caught by contradictory feelings. He was angry with Sam, no doubt about it, but his first unstudied reaction at seeing him had been the warm pleasure one gets from recognizing a familiar face among strangers—the anger had come a split second later. Now Sam looked at him with easy cynicism, a quizzical smile on his face. "Well, kid?" he repeated. "If you want to turn me in, let's go back and get it over with. I won't run."

Max looked back at him peevishly. "Oh, forget it!"

"Thanks. I'm sorry about it, kid. I really am."

"Then why did you do it?"

Sam's face changed suddenly to a sad, faraway look, then resumed its cheerful cynicism. "I was tempted by an idea, old son—every man has his limits. Some day I'll tell you. Now, how about a bit to eat and a gab? There's a joint near here where we can talk without having the nosies leaning over our shoulders."

"I don't know as I want to."

"Oh, come now! The food isn't much but it's better than mulligan."

Max had been ready with a stiff speech about how he would not turn Sam in, but he certainly did not want to eat with him; the mention of mulligan brought him up short. He remembered uneasily that Sam had not inquired as to *his* morals, but had shared his food.

"Well… okay."

"That's my boy!" They went on down the street. The neighborhood was a sort to be found near the port in any port city; once off the pompous Avenue of the Planets it became more crowded, noisier, more alive, and somehow warmer and more friendly despite a strong air of "keep your hand on your purse." Hole-in-the-wall tailor shops, little restaurants none too clean, cheap hotels, honky-tonks, fun arcades, exhibits both "educational" and "scientific," street vendors, small theaters with gaudy posters and sounds of music leaking out, shops fronting for betting parlors, tattoo parlors fronting for astrologers, and the inevitable Salvation Army mission gave the street flavor its stylish cousins lacked. Martians in trefoil sunglasses and respirators, humanoids from Beta Corvi III, things with exoskeletons from Allah knew where, all jostled with humans of all shades and all blended in easy camaraderie.

Sam stopped at a shop with the age-old symbol of three golden spheres. "Wait here. Be right out."

Max waited and watched the throng. Sam came out shortly without his coat. "Now we eat."

"Sam! Did you pawn your coat?"

"Give the man a cigar! How did you guess?"

"But… Look, I didn't know you were broke; you looked prosperous. Get it back, I'll… I'll pay for our lunch."

"Say, that's sweet of you, kid. But forget it. I don't need a coat this weather. Truth is, I was dressed up just to make a good impression at —well, a little matter of business."

Max blurted out, "But how did you… ", then shut up. Sam grinned. "Did I steal the fancy rags? No. I encountered a citizen who believed in percentages and engaged him in a friendly game. Never bet on percentages, kid; skill is more fundamental. Here we are."

The room facing the street was a bar, beyond was a restaurant. Sam led him on through the restaurant, through the kitchen, down a passage off which there were card rooms, and ended in a smaller, less pretentious dining room; Sam picked a table in a corner. An enormous Samoan shuffled up, dragging one leg. Sam nodded, "Howdy, Percy." He turned to Max. "A drink first?"

"Uh, I guess not."

"Smart lad. Lay off the stuff. Irish for me, Percy, and we'll both have whatever you had for lunch." The Samoan waited silently. Sam shrugged and laid money on the table, Percy scooped it up.

Max objected, "But I was going to pay."

"You can pay for the lunch. Percy owns the place," he added. "He's offensively rich, but he didn't get that way by trusting the likes of me. Now tell me about yourself, old son. How you got here? How you made out with the astrogators… everything. Did they kill the fatted calf?"

"Well, no." There seemed to be no reason not to tell Sam and he found that he wanted to talk. Sam nodded at the end.

"About what I had guessed. Any plans now?"

"No. I don't know what to do now, Sam."

"Hmm… it's an ill wind that has no turning. Eat your lunch and let me think."

Later he added, "Max, what do you *want* to do?"

"Well… I wanted to be an astrogator…"

"That's out."

"I know."

"Tell me, did you want to be an astrogator and nothing else, or did you simply want to go into space?"

"Why, I guess I never thought about it any other way."

"Well, think about it."

Max did so. "I want to space. If I can't go as an astrogator, I want to go anyhow. But I don't see how. The Astrogators' Guild is the only one I stood a chance for."

"There are ways."

"Huh? Do you mean put in for emigration?"

Sam shook his head. "It costs more than you could save to go to one of the desirable colonies—and the ones they give you free rides to I wouldn't wish on my worst enemies."

"Then what do you mean?"

Sam hesitated. "There are ways to wangle it, old son—if you do what I say. This uncle of yours—you were around him a lot?"

"Why, sure."

"Talked about space with you?"

"Certainly. That's all we talked about."

"Hmm… how well do you know the patter?"

5 — "…YOUR MONEY AND MY KNOW-HOW… "

"The patter?" Max looked puzzled. "I suppose I know what everybody knows."

"Where's the worry hole?"

"Huh? That's the control room."

"If the cheater wants a corpse, where does he find it?"

Max looked amused. "That's just stuff from SV serials, nobody talks like that aboard ship. The cook is the cook, and if he wanted a side of beef, he'd go to the reefer for it."

"How do you tell a 'beast' from an animal?"

"Why, a 'beast' is a passenger, but an animal is just an animal, I guess."

"Suppose you were on a ship for Mars and they announced that the power plant had gone blooie and the ship was going to spiral into the Sun? What would you think?"

"I'd think somebody was trying to scare me. In the first place, you wouldn't be 'on' a ship—'in' is the right word. Second, a spiral isn't one of the possible orbits. And third, if a ship was headed for Mars from Earth, it couldn't fall into the Sun; the orbit would be incompatible."

"Suppose you were part of a ship's crew in a strange port and you wanted to go out and look the place over. How would you go about asking the captain for permission?"

"Why, I wouldn't."

"You'd just jump ship?"

"Let me finish. If I wanted to hit dirt, I'd ask the first officer; the captain doesn't bother with such things. If the ship was big enough, I'd have to ask my department head first." Max sat up and held Sam's eye. "Sam—you've been spaceside. Haven't you?"

"What gave you that notion, kid?"

"What's your guild?"

"Stow it, Max. Ask me no questions and I'll sell you no pigs in a poke. Maybe I've studied up on the jive just as you have."

"I don't believe it," Max said bluntly.

Sam looked pained. Max went on, "What's this all about? You ask me a bunch of silly questions—sure, I know quite a bit about spaceside; I've been reading about it all my life and Uncle Chet would talk by the hour. But what of it?"

Sam looked at him and said softly, "Max—the *Asgard* is raising next Thursday—for starside. Would you like to be in her?"

Max thought about it. To be in the fabulous *Asgard*, to be heading out to the stars, to be—he brushed the vision aside. "Don't talk that way, Sam! You know I'd give my right arm. Why needle me?"

"How much money have you?"

"Huh? Why?"

"How much?"

"I haven't even had time to count it." Max started to haul out the wad of bills he had been given; Sam hastily and unobtrusively stopped him.

"Psst!" he protested. "Don't flash a roll in here. Do you want to eat through a slit in your throat? Keep it down!"

Startled, Max took the advice. He was still more startled when he finished the tally; he had known that he had been given quite a lot of money but this was more than he had dreamed. "How much?" Sam persisted. Max told him, Sam swore softly. "Well, it will just have to do."

"Do for what?"

"You'll see. Put it away."

As Max did so he said wonderingly, "Sam, I had no idea those books were so valuable."

"They aren't."

"Huh?"

"It's malarkey. Lots of guilds do it. They want to make it appear that their professional secrets are precious, so they make the candidate put up a wad of dough for his reference books. If those things were published in the ordinary way, they'd sell at a reasonable price."

"But that's right, isn't it? As the Worthy High Secretary explained, it wouldn't do for just anybody to have that knowledge."

Sam made a rude noise and pretended to spit. "What difference would it make? Suppose you still had them—you don't have a ship to conn."

"But… " Max stopped and grinned. "I can't see that it did any good to take them away from me anyhow. I've read them, so I know what's in them."

"Sure you know. Maybe you even remember some of the methods. But you don't have all those columns of figures so you can look up the one you need when you need it. That's what they care about."

"But I do! I read them, I tell you." Max wrinkled his forehead, then began to recite: "'Page 272, Calculated Solutions of the Differential Equation of Motion by the Ricardo Assumption—" He began to reel off a series of seven-place figures. Sam listened in growing surprise, then stopped him.

"Kid, you really remember that? You weren't making it up?"

"Of course not, I *read* it."

"Well, I'll be a beat up… Look, you're a page-at-aglance reader? Is that it?"

"No, not exactly. I'm a pretty fast reader, but I do have to read it. But I don't forget. I never have been able to see how people forget. I can't forget anything."

Sam shook his head wonderingly. "I've been able to forget a lot of things, thank Heaven." He thought for a moment. "Maybe we should forget the other caper and exploit this talent of yours. I can think of angles."

"What do you mean? And what other caper?"

"Hmm… no, I was right the first time. The idea is to get away from here. And with your funny memory the chances are a whole lot better. Even though you sling the slang pretty well I was worried. Now I'm not."

"Sam, stop talking riddles. What are you figuring on?'

"Okay, kid, I'll lay it on the table." He glanced around, leaned forward, and spoke even more quietly. "We take the money and I spread it around carefully. When the *Asgard* raises, we're signed on as crewmen."

"As apprentices? We wouldn't even have time for ground school. And besides you're too old to 'prentice."

"Use your head! We don't have enough to pay one apprentice fee, let alone two, in any space guild—and the *Asgard* isn't signing 'prentices anyhow. We'll be experienced journeymen in one of the guilds, with records to prove it."

When the idea soaked in, Max was shocked. "But they put you in jail for that!"

"Where do you think you are now?"

"Well, I'm not in jail. And I don't want to be."

"This whole planet is one big jail, and a crowded one at that. What chance have you got? If you aren't born rich, or born into one of the hereditary guilds, what can you do? Sign up with one of the labor companies."

"But there are non-hereditary guilds."

"Can you pay the fee? You've got a year, maybe two until you're too old to 'prentice. If you were sharp with cards you might manage it—but can you earn it? You should live so long! Your old man should have saved it; he left you a farm instead." Sam stopped suddenly, bit his thumb. "Max, I'll play fair. Your old man did leave you a fair start in life. With the money you've got you can go home, hire a shyster, and maybe squeeze that Montgomery item out of the money he swindled for your farm. Then you can buy your apprenticeship in some guild. Do it, kid. I won't stand in your way." He watched Max narrowly.

Max reflected that he had just refused a chance to pick a trade and be given a free start. Maybe he should reconsider. Maybe… "No! That's not what I want. This… this, uh, scheme of yours; how do we do it?"

Sam relaxed and grinned. "My boy!"

Sam got them a room over Percy's restaurant. There he coached him. Sam went out several times and Max's money went with him. When Max protested Sam said wearily, "What do you want? To hold my heart as security? Do you want to come along and scare 'em out of the dicker? The people I have to reason with will be taking chances. Or do you think you can arrange matters yourself? It's your money and my know-how… that's the partnership."

Max watched him leave the first time with gnawing doubts, but Sam came back. Once he brought with him an elderly, gross woman who looked Max over as if he were an animal up for auction. Sam did not introduce her but said, "How about it? I thought a mustache would help."

She looked at Max from one side, then the other. "No," she decided, "that would just make him look made up for amateur theatricals." She touched Max's head with moist, cold fingers; when he drew back, she admonished, "Don't flinch, honey duck. Aunt Becky has to work on you. No, we'll move back his hair line above his temples, thin it out on top, and kill its gloss. Some faint wrinkles tattooed around his eyes.

Mmm… that's all. Mustn't overdo it."

When this fat artist was through Max looked ten years older. Becky asked if he wanted his hair roots killed, or would he prefer to have his scalp return to normal in time? Sam started to insist on permanence, but she brushed him aside. "I'll give him a bottle of 'Miracle Gro'—no extra charge, it's just rubbing alcohol—and he can make a big thing of using it. How about it, lover? You're too pretty to age you permanently."

Max accepted the "Miracle Gro"—hair restored or your money back.

Sam took away his citizen's identification card, returned with another one. It had his right name, a wrong age, his right serial number, a wrong occupation, his own thumb print, and a wrong address. Max looked at it curiously. "It looks real."

"It should. The man who made it makes thousands of real ones—but he charges extra for this." That night Sam brought him a book titled *Ship Economy* and embossed with the seal of the Guild of Space Stewards, Cooks, and Purser's Clerks. "Better stay up all night and see how much you can soak up. The man it belongs to won't sleep more than ten hours even with the jolt Percy slipped into his nightcap. Want a pill to keep you awake?"

"I don't think so." Max examined it. It was in fine print and quite thick. But by five in the morning he had finished it. He woke Sam and gave it back, then went to sleep, his head buzzing with stowage and dunnage, moment arms and mass calculations, hydroponics techniques, cargo records, tax forms, diets, food preservation and preparation, daily, weekly, and quarterly accounts, and how to get rats out of a compartment which must not be evacuated. Simple stuff, he decided—he wondered why such things were considered too esoteric for laymen.

On the fourth day of his incarceration Sam fitted him out with spaceside clothes, none of them new, and gave him a worn plastileather personal record book. The first page stated that he was an accepted brother of the Stewards, Cooks, and Purser's Clerks, having honorably completed his apprenticeship. It listed his skills and it appeared that his dues had been paid each quarter for seven years. What appeared to be his own signature appeared above that of the High Steward, with the seal of the guild embossed through both. The other pages recorded his trips, his efficiency ratings, and other permanent data, each properly signed by the first officers and pursers concerned. He noted with interest that he had been fined three days pay in the *Cygnus* for smoking in an unauthorized place and that he had once for six weeks been allowed to strike for chartsman, having paid the penalty to the Chartsmen & Computers Guild for the chance.

"See anything odd?" asked Sam.

"It all looks funny to me."

"It says you've been to Luna. Everybody's been to Luna. But the ships you served in are mostly out of commission and none of the pursers happens to be in Earthport now. The only starship you ever jumped in was lost on the trip immediately after the one you took. Get me?"

"I think so."

"When you talk to another spaceman, no matter what ship he served in, it's not one you served in—you won't be showing this record to anybody but the purser and your boss anyhow."

"But suppose *they* served in one of these?"

"Not in the *Asgard*. We made darn sure. Now I'm going to take you out on an evening of gaiety. You'll drink warm milk on account of your ulcer and you'll complain when you can't get it. And that's just about all you'll talk about—your symptoms. You'll start a reputation right now for being untalkative; you can't make many mistakes with your mouth shut. Watch yourself, kid, there will be spacemen around you all evening. If you mess it up, I'll leave you dirtside and raise without you. Let me see you walk again."

Max walked for him. Sam cursed gently. "Cripes, you still walk like a farmer. Get your feet out of those furrows, boy."

"No good?"

"It'll have to do. Grab your bonnet. We'll strike while the iron's in the fire and let the bridges fall where they may."

6 — "SPACEMAN" JONES

The *Asgard* was to raise the next day. Max woke early and tried to wake Sam, but this proved difficult. At last the older man sat up. "Oh, what a head! What time is it?"

"About six."

"And you woke me? Only my feeble condition keeps me from causing you to join your ancestors. Go back to sleep."

"But today's the day!"

"Who cares? She raises at noon. We'll sign on at the last minute; that way you won't have time to make a slip."

"Sam? *How do you know they'll take us?*"

"Oh, for Pete's sake! It's all arranged. Now shut up. Or go downstairs and get breakfast—but don't talk to anybody. If you're a pal, you'll bring me a pot of coffee at ten o'clock."

"And breakfast?"

"Don't mention food in my presence. Show some respect." Sam pulled the covers up over his head.

It was nearly eleven thirty when they presented themselves at the gate of the port; ten minutes later before the bus deposited them at the base of the ship. Max looked up at its great, bulging sides but was cut short by a crewman standing at the lift and holding a list. "Names."

"Anderson."

"Jones."

He checked them off. "Get in the ship. You should have been here an hour ago." The three climbed into the cage; it swung clear of the ground and was reeled in, swaying, like a bucket on a well rope.

Sam looked down and shuddered. "Never start a trip feeling good," he advised Max. "It might make you sorry to be leaving." The cage was drawn up inside the ship; the lock closed after them and they stepped out into the *Asgard.* Max was trembling with stage fright.

He had expected to be sworn into the ship's company by the first officer, as called for by law. But his reception was depressingly unceremonious. The crewman who had checked them into the ship told them to follow him; he led them to the Purser's office. There the Chief Clerk had them sign and thumbprint the book, yawning the while and tapping his buck teeth. Max surrendered his forged personal record book, while feeling as if the deception were stamped on it in bold letters. But Mr. Kuiper merely chucked it into a file basket. He then turned to them. "This is a taut ship. You've started by very nearly missing it. That's a poor start."

Sam said nothing. Max said, "Yessir."

The Chief Clerk went on, "Stow your gear, get your chow, and report back." He glanced at a wall chart. "One of you in D-112, the other in E-009."

Max started to ask how to get there, but Sam took his elbow and eased him out of the office. Outside he said, "Don't ask any questions you can avoid. We're on Baker deck, that's all we need to know." Presently they came to a companionway and started back down. Max felt a sudden change in pressure, Sam grinned. "She's sealed. Won't be long now."

They were in D-112, an eight-man bunkroom, and Sam was showing him how to set the lock on the one empty locker when there was a distant call on a loudspeaker. Max felt momentarily dizzy and his weight seemed to pulse. Then it stopped. Sam remarked, "They were a little slow synchronizing the field—or else this bucket of bolts has an unbalanced phaser." He clapped Max on the back. "We made it, kid."

They were in space.

E-009 was down one more deck and on the far side; they left Sam's gear there and started to look for lunch. Sam stopped a passing engineer's mate. "Hey, shipmate—we're fresh caught. Where's the crew's mess?"

"Clockwise about eighty and inboard, this deck." He looked them over. "Fresh caught, eh? Well, you'll find out."

"Like that, huh?"

"Worse. A madhouse squared. If I wasn't married, I'd 'a' stayed dirtside." He went on his way.

Sam said, "Ignore it, kid. All the oldtimers in a ship claim its the worst madhouse in space. A matter of pride." But their next experience seemed to confirm it; the serving window in the mess room had closed at noon, when the ship lifted; Max mournfully resigned himself to living with a tight belt until supper. But Sam pushed on into the galley and came out presently with two loaded trays. They found empty places and sat down.

"How did you do it?"

"Any cook will feed you if you let him explain first what a louse you are and how by rights he doesn't have to."

The food was good—real beef patties, vegetables from the ship's gardens, wheat bread, a pudding, and coffee. Max polished his platter and wondered if he dared ask for seconds. He decided against it. The talk flowed around him and only once was there danger that his tyro status might show up, that being when a computerman asked him a direct question as to his last trip.

Sam stalled it off. "Imperial survey," he answered briefly. "We're both still covered."

The computerman grinned knowingly. "Which jail were you in? The Imperial Council hasn't ordered a secret survey in years."

"This one was so secret they forgot to tell you about it. Write 'em a letter and burn them out about it," Sam stood up. "Finished, Max?"

On the way back to the Purser's Office Max worried as to his probable assignment, checking over in his mind the skills and experience he was alleged to have. He need not have worried; Mr. Kuiper, with a fine disregard for such factors, assigned him as stableman.

The *Asgard* was a combined passenger liner and freighter. She carried this trip Hereford breeding stock, two bulls and two dozen cows, and an assortrnent of other animals consigned for ecologic and economic reasons to colonies—pigs, chickens, sheep, a pair of Angora goats, a family of llamas. It was contrary to Imperial policy to plant most terrestrial fauna on other planets; the colonials were expected to establish economy with indigenous flora and fauna—but some animals have been bred for so many generations for the use of man that they are not easily replaced by exotic creatures. On Gamma Leonis VI (b), New Mars, the saurians known locally as "chuckleheads" or "chucks" could and did replace Percherons as draft animals with greater efficiency and economy—but men disliked them. There was never the familial trust that exists between horses and men; unless a strain of chucks should develop a degree of rapport with men (which seemed unlikely) they would eventually die out and be replaced by the horse, for the unforgivable sin of failing to establish a firm treaty with the most ravenous, intolerant, deadly, and successful of the animals in the explored universe, Man.

There was also a cage of English sparrows. Max never did find out where these noisy little scavengers were believed to be necessary, nor was he acquainted with the complex mathematical analysis by which such conclusions were reached. He simply fed them and tried to keep their quarters clean.

There were cats in the *Asgard*, too, but most of these were free citizens and crewmen, charged with holding down the rats and mice that had gone into space along with mankind. One of Max's duties was to change the sand boxes on each deck and take the soiled ones to the oxydizer for processing. The other cats were pets, property of passengers, unhappy prisoners in the kennel off the stables. The passengers' dogs lived there, too; no dogs were allowed to run free.

Max wanted to look back at Earth and see it as a shrinking globe in the sky, but that was a privilege reserved for passengers. He spent the short period when it would have been possible in hauling (by hand) green timothy hay from the hydroponics airconditioning plant to the stables and in cleaning said stables. It was a task he neither liked nor disliked; by accident he had been assigned to work that he understood.

His immediate boss was the Chief Ship's Steward, Mr. Giordano. Mr. "Gee" split the ship's housekeeping with Mr. Dumont, Chief Passengers' Steward; their domains divided at Charlie deck. Thus Mr. Dumont had passengers' quarters, officers' country, offices, and the control and communication stations, while Giordano was responsible for everything down (or aft) to but not including the engineering space—crew's quarters, mess, and galley, stores, stables and kennel, hydroponics deck, and cargo spaces. Both worked for the Purser, who in turn was responsible to the First Officer.

The organization of starships derived in part from that of military vessels, in part from ocean liners of earlier days, and in part from the circumstances of interstellar travel. The first officer was boss of the ship and a wise captain did not interfere with him. The captain, although by law monarch of his miniature world, turned his eyes outward; the first officer turned his inward. As long as all went well the captain concerned himself only with the control room and with astrogation; the first officer bossed everything else. Even astrogators, communicators, computermen, and chartsmen were under the first officer, although in practice he had nothing to do with them when they were on duty since they worked in the "worry hole" under the captain.

The chief engineer was under the first officer, too, but he was nearly an autonomous satrap. In a taut, well-run ship he kept his bailiwick in such shape that the first officer did not need to worry about it. The chief engineer was responsible not only for the power plant and the Horst-Conrad impellers but for all auxiliary engineering equipment wherever located—for example the pumps and fans of the hydroponics installations, even though the purser, through his chief ship's steward, took care of the farming thereof.

Such was the usual organization of starship liner-freighters and such was the *Asgard*. It was not identical with the organization of a man-of-war and very different from that of the cheerless transports used to ship convicts and paupers out to colonies that were being forced—in *those* ships, the purser's department was stripped to a clerk or two and the transportees did all the work, cooking, cleaning, handling cargo, everything. But the *Asgard* carried paid passengers, some of whom measured their wealth in megabucks; they expected luxury hotel service even lightyears out in space. Of the three main departments of the *Asgard*, astrogation, engineering, and housekeeping, the Purser's was by far the largest.

A first officer could reach that high status from chief astrogator, from chief engineer, or from purser, but only if he were originally an astrogator could he go on to captain. The three officer types were essentially mathematicians, business managers, or physicists; a captain necessarily had to be able to practice the mathematical skill of astrogation. First Officer Walther, as was usually the case with a liner, had formerly been a purser.

The *Asgard* was a little world, a tiny mobile planet. It had its monarch the captain, its useless nobility the passengers, its technical and governing class, and its hewers of wood and drawers of water. It contained flora and fauna in ecological balance; it carried its miniature sun in its power plant. Although its schedule contemplated only months in space, it was capable of staying in space indefinitely. The chef might run out of caviar, but there would be no lack of food, nor of air, nor of heat and light.

Max decided that he was lucky to be assigned to Mr. Giordano rather than to Chief Clerk Kuiper. Mr. Kuiper supervised his clerks minutely, but Mr. Gee did not often stir his fat frame out of his office-stateroom. He was a jovial boss—provided everything ran to suit him. Mr. Gee found it an effort to go all the way down to the stables; once he became convinced that Max was giving the animals proper care and keeping the place clean he gave up inspecting, merely requiring Max to report daily. This gave Giordano more time for his principal avocation, which was distilling a sort of vodka in a cubby in his stateroom, using materials grown in the hydroponds—also in his charge. He carried on a clandestine trade in his product with the crew. By keeping his mouth shut and his ears open Max learned that this was a usual prerogative of a chief ship's steward, ignored as long as the steward had the judgment to limit his operations. The ship, of course, had a wine mess and bar, but that was for the "beasts"—crewmen could not patronize it.

"I was once in a ship," Sam told Max, "where the First clamped down—busted up the still, busted the steward to cleaning decks, and generally threw the book." He stopped to puff on his cigar, a gift from the passenger steward; they were hiding out in Max's stables, enjoying a rest and a gab. "Didn't work out."

"Why not?"

"Use your head. Forces must balance, old son. For every market there is a supplier. That's the key to the nutshell. In a month there was a still in durn near every out-of-the-way compartment in the ship and the crew was so demoralized it wasn't fit to stuff vacuum. So the Captain had a talk with the First and things went back to normal."

Max thought it over. "Sam? Were you that ship's steward?"

"Huh? What gave you that idea?"

"Well… you've been in space before; you no longer make any bones about it. I just thought—well, you've never told me what your guild was, nor why you were on dirt, or why you had to fake it to get back to space again. I suppose it's none of my business."

Sam's habitual cynical smile gave way to an expression of sadness. "Max, a lot of things can happen to a man when he thinks he has the world by the tail. Take the case of a friend of mine, name of Roberts. A sergeant in the Imperial Marines, good record, half a dozen star jumps, a combat decoration or two. A smart lad, boning to make warrant officer. But he missed his ship once—hadn't been on Terra for some time and celebrated too much. Should have turned himself in right away, of course, taken his reduction in rank and lived it down. Trouble was he still had money in his pocket. By the time he was broke and sober it was too late. He never quite had the guts to go back and take his court martial and serve his sentence. Every man has his limits."

Max said presently, "You trying to say you used to be a marine?"

"Me? Of course not, I was speaking of this guy Richards, just to illustrate what can happen to a man when he's not looking. Let's talk of more pleasant things. Kid, what do you plan to do next?"

"What do you mean?"

"Well, what do you figure on doing after this jump?'

"Oh. More of the same, I guess. I like spacing. I suppose I'll try to keep my nose clean and work up to chief steward or chief clerk."

Sam shook his head. "Think it through, kid. What happens when your record in this ship is mailed to the guild? And another copy is mailed to the Department of Guilds and Labor?"

"*What*?"

"I'll tell you. Maybe nothing happens at first, maybe you can space for another cruise. But eventually the red tape unwinds, they compare notes and see that while your ship lists you as an experienced steward's mate, there isn't any Max Jones in their files. Comes the day you ground at Terra and a couple of clowns with sidearms are waiting at the foot of the lift to drag you off to the calabozo."

"But Sam! I thought it was all fixed?"

"Don't blow a gasket. Look at me, I'm relaxed—and it applies to me, too. More so, for I have other reasons we needn't go into to want to let sleeping dogs bury their own dead. As for it being 'all fixed,' it is —everything I promised. You're here, aren't you? But as for the files: old son, it would have taken ten times the money to tamper with guild files, and as for locating a particular microfilm in New Washington and substituting a fake that would show the record you are supposed to have—well, I wouldn't know how to start, though no doubt it could be done, with enough time, money, and finesse."

Max felt sensations almost identical with those he had experienced when Montgomery had announced that the farm was sold. Despite his menial position he liked it aboard ship, he had had no intention of ever doing anything else. He got along with his boss, he was making friends, he was as cozy as a bird in its nest. Now the nest was suddenly torn down. Worse, he was in a trap.

He turned white. Sam put a hand on his shoulder. "Stop spinning, kid! You're not in a jam."

"Jail—"

"Jail my aunt's Sunday hat! You're safe as dirt until we get back. You can walk away from the *Asgard* at Earthport with your wages in your pocket and have days at least, maybe weeks or months, before anyone will notice, either at the guild mother hall or at New Washington. You can lose yourself among four billion people. You won't be any worse off than you were when you first ran into me—you were trying to get lost then, remember?—and you'll have one star trip under your belt to tell your kids about. Or they may never look for you; some clerk may chuck your trip record into the file basket and leave it there until it gets lost rather than bother. Or you might be able to persuade a clerk in Mr. Kuiper's office to lose the duplicates, not mail them in. Nelson, for example; he's got a hungry look." Sam eyed him carefully, then added, "Or you might do what I'm going to do."

Only part of what Sam had said had sunk in. Max let the record play back and gradually calmed down as he began to understand that his situation was not entirely desperate. He was inclined to agree about Nelson, as Nelson had already suggested indirectly that sometimes the efficiency marks on the ship's books were not necessarily the ones that found their way into the permanent records —under certain circumstances. He put the idea aside, not liking it and having no notion anyhow of how to go about offering a bribe.

When he came, in his mental play back, to Sam's last remark, it brought him to attention. "What are *you* going to do?"

Sam eyed the end of his cigar stub. "I'm not going back."

This required no diagram to be understood. But, under Imperial decrees, the suggested offense carried even heavier punishment than faking membership in a guild. Deserting was almost treason. "Keep talking," Max said gruffly.

"Let's run over where we touch this cruise. Garson's Planet—domed colonies, like Luna and Mars. In a domed colony you do exactly what the powers-that-be say, or you stop breathing. You might hide out and have a new identity grafted on, but you would still be in the domes. No good, there's more freedom even back on Terra. Nu Pegasi VI, Halcyon—not bad though pretty cold at aphelion. But it is still importing more than it exports which means that the Imperials run the show and the locals will help dig out a wanted man. Now we come to Nova Terra, Beta Aquarü X—and that, old son, is what the doctor ordered and why the preacher danced."

"You've been there?"

"Once. I should have stayed. Max, imagine a place like Earth, but sweeter than Terra ever was. Better weather, broader richer lands… forests aching to be cut, game that practically jumps into the stew pot. If you don't like settlements, you move on until you've got no neighbors, poke a seed in the ground, then jump back before it sprouts. No obnoxious insects. Practically no terrestrial diseases and no native diseases that like the flavor of our breed. Gushing rivers. Placid oceans. Man, I'm telling you!"

"But wouldn't they haul us back from there?"

"Too big. The colonists *want* more people and they won't help the Imperials. The Imperial Council has a deuce of a time just collecting taxes. They don't even try to arrest a deserter outside the bigger towns." Sam grinned. "You know why?"

"Why?"

"Because it didn't pay. An Imperial would be sent to Back-and-Beyond to pick up someone; while he was looking he would find some golden-haired daughter of a rancher eyeing him—they run to eight or nine kids, per family and there are always lots of eligible fillies, husband-high and eager. So pretty quick he is a rancher with a beard and a new name and a wife. He was a bachelor and he hasn't been home lately—or maybe he's married back on Terra and doesn't want to go home. Either way, even the Imperial Council can't fight human nature."

"I don't want to get married."

"That's your problem. But best of all, the place still has a comfortable looseness about it. No property taxes, outside the towns. Nobody would pay one; they'd just move on, if they didn't shoot the tax collector instead. No guilds—you can plow a furrow, saw a board, drive a truck, or thread a pipe, all the same day and never ask permission. A man can do anything and there's no one to stop him, no one to tell him he wasn't born into the trade, or didn't start young enough, or hasn't paid his contribution. There's more work than there are men to do it and the colonists just don't care."

Max tried to imagine such anarchy and could not, he had never experienced it. "But don't the guilds object?"

"What guilds? Oh, the mother lodges back earthside squawked when they heard, but not even the Imperial Council backed them up. They're not fools—and you don't shovel back the ocean with a fork."

"And that's where you mean to go. It sounds lovely," Max said wistfully.

"I do. It is. There was a girl—oh, she'll be married now; they marry young—but she had sisters. Now here is what I figure on—and you, too, if you want to tag along. First time I hit dirt I'll make contacts. The last time I rate liberty, which will be the night before the ship raises if possible, I'll go dirtside, then in a front door and out the back and over the horizon so fast I won't even be a speck. By the time I'm marked 'late returning' I'll be hundreds of miles away, lying beside a chuckling stream in a virgin wilderness, letting my beard grow and memorizing my new name. Say the word and you'll be on the bank, fishing."

Max stirred uneasily. The picture aroused in him a hillbilly homesickness he had hardly been aware of. But he could not shuffle off his proud *persona* as a spaceman so quickly. "I'll think about it."

"Do that. It's a good many weeks yet, anyhow." Sam got to his feet. "I'd better hurry back before Ole Massa Dumont wonders what's keeping me. Be seeing you, kid—and remember: it's an ill wind that has no turning.

7 — ELDRETH

Max's duties did not take him above "C" deck except to service the cats' sand boxes and he usually did that before the passengers were up. He wanted to visit the control room but he had no opportunity, it being still higher than passengers' quarters. Often an owner of one of the seven dogs and three cats in Max's custody would come down to visit his pet. This sometimes resulted in a tip. At first his cross-grained hillbilly pride caused him to refuse, but when Sam heard about it, he swore at him dispassionately. "Don't be a fool! They can afford it. What's the sense?"

"But I would exercise their mutts anyhow. It's my job." He might have remained unconvinced had it not been that Mr. Gee asked him about it at the end of his first week, seemed to have a shrewd idea of the usual take, and expected a percentage—"for the welfare fund."

Max asked Sam about the fund, was laughed at. "That's a very interesting question. Are there any more questions?"

"I suppose not."

"Max, I like you. But you haven't learned yet that when in Rome, you shoot Roman candles. Every tribe has its customs and what is moral one place is immoral somewhere else. There are races where a son's first duty is to kill off his old man and serve him up as a feast as soon as he is old enough to swing it—civilized races, too. Races the Council recognizes diplomatically. What's your moral judgment on that?"

Max had read of such cultures—the gentle and unwarlike Bnathors, or the wealthy elephantine amphibians of Paldron who were anything but gentle, probably others. He did not feel disposed to pass judgment on nonhumans. Sam went on, "I've known stewards who would make Jelly Belly look like a philanthropist. Look at it from his point of view. He regards these things as prerogatives of his position, as rightful a part of his income as his wages. Custom says so. It's taken him years to get to where he is; he expects his reward."

Sam, Max reflected, could always out-talk him.

But he could not concede that Sam's thesis was valid; there were things that were right and others that were wrong and it was not just a matter of where you were. He felt this with an inner conviction too deep to be influenced by Sam's cheerful cynicism. It worried Max that he was where he was as the result of chicanery, he sometimes lay awake and fretted about it.

But it worried him still more that his deception might come to light. What to do about Sam's proposal was a problem always on his mind.

The only extraterrestrial among Max's charges was a spider puppy from the terrestrian planet Hespera. On beginning his duties in the *Asgard* Max found the creature in one of the cages intended for cats; Max looked into it and a sad, little, rather simian face looked back at him. "Hello, Man."

Max knew that some spider puppies had been taught human speech, after a fashion, but it startled him; he jumped back. He then recovered and looked more closely. "Hello yourself," he answered. "My, but you are a fancy little fellow." The creature's fur was a deep, rich green on its back, giving way to orange on the sides and blending to warm cream color on its little round belly.

"Want out," stated the spider puppy.

"I can't let you out. I've got work to do." He read the card affixed to the cage: "Mr. Chips" it stated, *Pseudocanis hexapoda hesperae,* Owner: Miss E. Coburn, A-092; there followed a detailed instruction as to diet and care. Mr. Chips ate grubs, a supply of which was to be found in freezer compartment H-118, fresh fruits and vegetables, cooked or uncooked, and should receive iodine if neither seaweed nor artichokes was available. Max thumbed through his mind, went over what he had read about the creatures, decided the instructions were reasonable.

"*Please* out!" Mr. Chips insisted.

It was an appeal hard to resist. No maiden fayre crying from a dungeon tower had ever put it more movingly. The compartment in which the cats were located was small and the door could be fastened; possibly Mr. Chips could be allowed a little run—but later; just now he had to take care of other animals.

When Max left, Mr. Chips was holding onto the bars and sobbing gently. Max looked back and saw that it was crying real tears; a drop trembled on the tip of its ridiculous little nose; it was hard to walk out on it. He had finished with the stables before tackling the kennel; once the dogs and cats were fed and their cages policed he was free to give attention to his new friend. He had fed it first off, which had stopped the crying. When he returned, however, the demand to be let out resumed.

"If I let you out, will you get back in later?"

The spider puppy considered this. A conditional proposition seemed beyond its semantic attainments, for it repeated, "Want out." Max took a chance.

Mr. Chips landed on his shoulder and started going through his pockets. "Candy," it demanded. "Candy?"

Max stroked it. "Sorry, chum. I didn't know."

"Candy?"

"No candy." Mr. Chips investigated personally, then settled in the crook of Max's arm, prepared to spend a week or more. It wasn't, Max decided, much like a puppy and certainly not like a spider, except that six legs seemed excessive. The two front ones had little hands; the middle legs served double duty. It was more like a monkey, but felt like a cat. It had a slightly spicy fragrance and seemed quite clean.

Max tried talking to it, but found its intellectual attainments quite limited. Certainly it used human words meaningfully but its vocabulary was not richer than that which might be expected of a not-too-bright toddler.

When Max tried to return it to its cage there ensued twenty minutes of brisk exercise, broken by stalemates. Mr. Chips swarmed over the cages, causing hysterics among the cats. When at last the spider puppy allowed itself to be caught it still resisted imprisonment, clinging to Max and sobbing. He ended by walking it like a baby until it fell asleep.

This was a mistake. A precedent had been set and thereafter Max was not permitted to leave the kennel without walking the baby.

He wondered about the "Miss Coburn" described on the tag as Mr. Chips' owner. All of the owners of cats and dogs had shown up to visit their pets, but Mr. Chips remained unvisited. He visualized her as a sour and hatchet-faced spinster who had received the pet as a going-away present and did not appreciate it. As his friendship with the spider puppy grew his mental picture of Miss E. Coburn became even less attractive.

The *Asgard* was over a week out and only days from its first spatial transition before Max had a chance to compare conception with fact. He was cleaning the stables, with Mr. Chips riding his shoulder and offering advice, when Max heard a shrill voice from the kennel compartment. "Mr. *Chips!* Chipsie! Where are you?"

The spider puppy sat up suddenly and turned its head. Almost immediately a young female appeared in the door; Mr. Chips squealed, "Ellie!" and jumped to her arms. While they were nuzzling each other Max looked her over. Sixteen, he judged, or seventeen. Or maybe even eighteen—shucks, how was a fellow to tell when womenfolk did such funny things to their faces? Anyhow she was no beauty and the expression on her face didn't help it any.

She looked up at him and scowled. "What were you doing with Chipsie? Answer me that!"

It got his back fur up. "Nothing," he said stiffly. "If you will excuse me, ma'am, I'll get on with my work." He turned his back and bent over his broom.

She grabbed his arm and swung him around. "Answer me! Or… or

—I'll tell the Captain, that's what I'll do!"

Max counted ten, then just to be sure, recalled the first dozen 7-place natural logarithms. "That's your privilege, ma'am," he said with studied calmness, "but first, what's your name and what is your business here? I'm in charge of these compartments and responsible for these animals—as the Captain's representative." This he knew to be good space law, although the concatenation was long.

She looked startled. "Why, I'm Eldreth Coburn," she blurted as if anyone should know.

"And your business?"

"I came to see Mr. Chips—of course!"

"Very well, ma'am. You may visit your pet for a reasonable period," he added, quoting verbatim from his station instruction sheet. "Then he goes back in his cage. Don't disturb the other animals and don't feed them. That's orders."

She started to speak, decided not to and bit her lip. The spider puppy had been looking from face to face and listening to a conversation far beyond its powers, although it may have sensed the emotions involved. Now it reached out and plucked Max's sleeve. "Max," Mr. Chips announced brightly. "Max!"

Miss Coburn again looked startled. "Is that your name?"

"Yes, ma'am. Max Jones. I guess he was trying to introduce me. Is that it, old fellow?"

"Max," Mr. Chips repeated firmly. "Ellie."

Eldreth Coburn looked down, then looked up at Max with a sheepish smile. "You two seem to be friends. I guess I spoke out of turn. Me and my mouth."

"No offense meant I'm sure, ma'am."

Max had continued to speak stiffly; she answered quickly, "Oh, but I was rude! I'm sorry—I'm always sorry afterwards. But I got panicky when I saw the cage open and empty and I thought I had lost Chipsie."

Max grinned grudgingly. "Sure. Don't blame you a bit. You were scared."

"That's it—I was scared." She glanced at him. "Chipsie calls you Max. May I call you Max?"

"Why not? Everybody does—and it's my name."

"And you call me Eldreth, Max. Or Ellie."

She stayed on, playing with the spider puppy, until Max had finished with the cattle. She then said reluctantly, "I guess I had better go, or they'll be missing me."

"Are you coming back?"

"Oh, of course!"

"Ummm… Miss Eldreth…"

"Ellie."

"—May I ask a question?" He hurried on, "Maybe it's none of my business, but what took you so long? That little fellow has been awful lonesome. He thought you had deserted him."

"Not 'he'—'she'."

"Huh?"

"Mr. Chips is a girl," she said apologetically. "It was a mistake anyone could make. Then it was too late, because it would confuse her to change her name."

The spider puppy looked up brightly and repeated, "'Mr. Chips is a girl.' Candy, Ellie?"

"Next time, honey bun."

Max doubted if the name was important, with the nearest other spider puppy lightyears away. "You didn't answer my question?"

"Oh. I was so mad about that I wanted to bite. They wouldn't let me."

"Who's 'they'? Your folks?"

"Oh, no! The Captain and Mrs. Dumont." Max decided that it was almost as hard to extract information from her as it was from Mr. Chips. "You see, I came aboard in a stretcher—some silly fever, food poisoning probably. It couldn't be much because I'm tough. But they kept me in bed and when the Surgeon did let me get up, Mrs. Dumont said I mustn't go below 'C' deck. She had some insipid notion that it wasn't proper."

Max understood the stewardess's objection; he had already discovered that some of his shipmates were a rough lot—though he doubted that any of them would risk annoying a girl passenger. Why, Captain Blaine would probably space a man for that.

"So I had to sneak out. They're probably searching for me right now. I'd better scoot."

This did not fit in with Mr. Chips' plans; the spider puppy clung to her and sobbed, stopping occasionally to wipe tears away with little fists. "Oh, dear!"

Max looked perturbed. "I guess I've spoiled him—her. Mr. Chips, I mean." He explained how the ceremony of walking the baby had arisen.

Eldreth protested, "But I must go. What'll I do?"

"Here, let's see if he—she—will come to me." Mr. Chips would and did. Eldreth gave her a pat and ran out, whereupon Mr. Chips took even longer than usual to doze off. Max wondered if spider puppies could be hypnotized; the ritual was getting monotonous.

Eldreth showed up next day under the stern eye of Mrs. Dumont. Max was respectful to the stewardess and careful to call Eldreth "Miss Coburn." She returned alone the next day. He looked past her and raised his eyebrows. "Where's your chaperone?"

Eldreth giggled. "La Dumont consulted her husband and he called in your boss—the fat one. They agreed that you were a perfect little gentleman, utterly harmless. How do you like that?"

Max considered it. "Well, I'm an ax murderer by profession, but I'm on vacation."

"That's nice. What have you got there?"

It was a three-dimensional chess set. Max had played the game with his uncle, it being one that all astrogators played. Finding that some of the chartsmen and computermen played it, he had invested his tips in a set from the ship's slop chest. It was a cheap set, having no attention lights and no arrangements for remote-control moving, being merely stacked transparent trays and pieces molded instead of carved, but it sufficed.

"It's solid chess. Ever seen it?"

"Yes. But I didn't know you played it."

"Why not? Ever play flat chess?"

"Some."

"The principles are the same, but there are more pieces and one more direction to move. Here, I'll show you.

She sat tailor-fashion opposite him and he ran over the moves. "These are robot freighters… pawns. They can be commissioned anything else if they reach the far rim. These four are starships; they are the only ones with funny moves, they correspond with knights. They have to make interspace transitions, always off the level they're on to some other level and the transition has to be related a certain way, like this—or this. And this is the Imperial flagship; it's the one that has to be checkmated. Then there is… " They ran through a practice game, with the help of Mr. Chips, who liked to move the pieces and did not care whose move it was.

Presently he said, "You catch on pretty fast."

"Thanks."

"Of course, the *real* players play four-dimensional chess."

"Do you?"

"Well, no. But I hope to learn some day. It's just a matter of holding in your mind one more spatial relationship. My uncle used to play it. He was going to teach me, but he died." He found himself explaining about his uncle. He trailed off without mentioning his own disappointment.

Eldreth picked up one of the starship pieces from a tray. "Say, Max, we're pretty near our first transition, aren't we?"

"What time is it?"

"Uh, sixteen twenty-one—say, I'd better get upstairs."

"Then it's, uh, about thirty-seven hours and seven minutes, according to the computer crew."

"Mmm… you seem to know about such things. Could you tell me just what it is we do? I heard the Astrogator talking about it at the table but I couldn't make head nor tail. We sort of duck into a space warp; isn't that right?"

"Oh no, not a space warp. That's a silly term—space doesn't 'warp' except in places where *pi* isn't exactly three point one four one five nine two six five three five eight nine seven nine three two three eight four six two six four three three eight three two seven, and so forth—like inside a nucleus. But we're heading out to a place where space is *really* flat, not just mildly curved the way it is near a star. Anomalies are always flat, otherwise they couldn't fit together—be congruent."

She looked puzzled. "Come again?"

"Look, Eldreth, how far did you go in mathematics?"

"Me? I flunked improper fractions. Miss Mimsey was very vexed with me."

"Miss Mimsey?"

"Miss Mimsey's School for Young Ladies, so you see I can listen with an open mind." She made a face. "But you told me that all you went to was a country high school and didn't get to finish at that. Huh?"

"Yes, but I learned from my uncle. He was a great mathematician. Well, he didn't have any theorems named after him—but a great one just the same, *I* think." He paused. "I don't know exactly how to tell you; it takes equations. Say! Could you lend me that scarf you're wearing for a minute?"

"Huh? Why, sure." She removed it from her neck.

It was a photoprint showing a stylized picture of the solar system, a souvenir of Solar Union Day. In the middle of the square of cloth was the conventional sunburst surrounded by circles representing orbits of solar planets, with a few comets thrown in. The scale was badly distorted and it was useless as a structural picture of the home system, but it sufficed. Max took it and said, "Here's Mars."

Eldreth said, "You read it. That's cheating."

"Hush a moment. Here's Jupiter. To go from Mars to Jupiter you have to go from here to here, don't you?"

"Obviously."

"But suppose I fold it so that Mars is on top of Jupiter? What's to prevent just stepping across?"

"Nothing, I guess. Except that what works for that scarf wouldn't work very well in practice. Would it?"

"No, not that near to a star. But it works fine after you back away from a star quite a distance. You see, that's just what an anomaly is, a place where space is folded back on itself, turning a long distance into no distance at all."

"Then space *is* warped."

"No, no, no! Look, I just folded your scarf. I didn't stretch it out of shape! I didn't even wrinkle it. Space is the same way; it's crumpled like a piece of waste paper—but it's not warped, just crumpled. Through some extra dimensions, of course."

"I don't see any 'of course' about it."

"The math of it is simple, but it's hard to talk about because you can't see it. Space—*our* space—may be crumpled up small enough to stuff into a coffee cup, all hundreds of thousands of lightyears of it. A four-dimensional coffee cup, of course."

She sighed. "I don't see how a four-dimensional coffee cup could even hold coffee, much less a whole galaxy."

"No trouble at all. You could stuff this sheer scarf into a thimble. Same principle. But let me finish. They used to think that nothing could go faster than light. Well, that was both right and wrong. It…"

"How can it be both?"

"That's one of the Horst anomalies. You can't go faster than light, not in our space. If you do, you burst out of it. But if you do it where space is folded back and congruent, you pop right back into our own space again—but a long way off. How far off depends on how it's folded. And that depends on the mass in the space, in a complicated fashion that can't be described in words but can be calculated."

"But suppose you do it just anywhere?"

"That's what happened to the first ones who tried it. They didn't come back. And that's why surveys are dangerous; survey ships go poking through anomalies that have been calculated but never tried. That's also why astrogators get paid so much. They have to head the ship for a place you can't see and they have to put the ship there just under the speed of light and they have to give it the gun at just the right world point. Drop a decimal point or use a short cut that covers up an indeterminancy and it's just too bad. Now we've been gunning at twenty-four gee ever since we left the atmosphere. We don't feel it of course because we are carried inside a discontinuity field at an artificial one gravity—that's another of the anomalies. But we're getting up close to the speed of light, up against the Einstein Wall; pretty soon we'll be squeezed through like a watermelon seed between your finger and thumb and we'll come out near Theta Centauri fifty-eight lightyears away. Simple, if you look at it right."

She shivered. "*If* we come out, you mean."

"Well… I suppose so. But it's not as dangerous as helicopters. And look at it this way: if it weren't for the anomalies, there never would have been any way for us to reach the stars; the distances are too great. But looking back, it is obvious that all that emptiness couldn't be real—there *had* to be the anomalies. That's what my uncle used to say."

"I suppose he must have been right, even if I don't understand it." She scrambled to her feet. "But I do know that I had better hoof it back upstairs, or Mrs. Dumont may change her mind." She hugged Mr. Chips and shoved the little creature into Max's arms. "Walk the baby—that's a pal."

8 — THREE WAYS TO GET AHEAD

Max intended to stay awake during the first transition, but he slept through it. It took place shortly after five in the morning, ship's time. When he was awakened by idlers' reveille at six it was all over. He jerked on his clothes, fuming at not having awakened earlier, and hurried to the upper decks. The passageways above Charlie deck were silent and empty; even the early risers among the passengers would not be up for another hour. He went at once to the Bifrost Lounge and crossed it to the view port, placed there for the pleasure of passengers.

The stars looked normal but the familiar, age-old constellations were gone. Only the Milky Way, our own galaxy, seemed as usual—to that enormous spiral of stars, some hundred thousand lightyears across, a tiny displacement of less than sixty lightyears was inconsequential.

One extremely bright yellow-white star was visible; Max decided that it must be Theta Centauri, sun of Garson's Planet, their first stop. He left shortly, not wanting to chance being found loafing in passengers' country. The sand boxes which constituted his excuse were then replaced with greater speed than usual and he was back in crew's quarters in time for breakfast.

The passage to Garson's Planet took most of a month even at the high boost possible to Horst-Conrad ship. Eldreth continued to make daily trips to see Mr. Chips—and to talk with and play 3-dee chess with Max. He learned that while she had not been born on Hespera, but in Auckland on Terra, nevertheless Hespera was her home. "Daddy sent me back to have them turn me into a lady, but it didn't take."

"What do you mean?"

She grinned. "I'm a problem. That's why I've been sent for. You're in check, Max. Chipsie! Put that back. I think the little demon is playing on your side."

He gradually pieced together what she meant. Miss Mimsey's school had been the third from which she had been expelled. She did not like Earth, she was determined to go home, and she had created a reign of terror at each institution to which she had been entrusted.

Her widower father had been determined that she must have a "proper" education, but she had been in a better strategic position to impose her will—her father's Earthside attorneys had washed their hands of her and shipped her home.

Sam made the mistake of joshing Max about Eldreth. "Have you gotten her to set the day yet, old son?"

"Who set what day?"

"Now, now! Everybody in the ship knows about it, except possibly the Captain. Why play dumb with your old pal?"

"I don't know what you are talking about!"

"I wasn't criticizing, I was admiring. I'd never have the nerve to plot so high a trajectory myself. But as grandpop always said, there are just three ways to get ahead; sweat and genius, getting born into the right family, or marrying into it. Of the three, marrying the boss's daughter is the best, because—Hey! Take it easy!" Sam skipped back out of range.

"Take that back!"

"I do, I do. I was wrong. But my remarks were inspired by sheer admiration. Mistaken, I admit. So I apologize and withdraw the admiration."

"But… " Max grinned in spite of himself. It was impossible to stay angry at Sam. Sure, the man was a scamp, probably a deserter, certainly a belittler who always looked at things in the meanest of terms, but—well, there it was. Sam was his friend.

"I knew you were joking. How could I be figuring on getting married when you and I are going to…"

"Keep your voice down." Sam went on quietly, "You've made up your mind?"

"Yes. It's the only way out, I guess. I don't want to go back to Earth."

"Good boy! You'll never regret it." Sam looked thoughtful. "We'll need money."

"Well, I'll have some on the books."

"Don't be silly. You try to draw more than spending money and they'll never let you set foot on dirt. But don't worry—save your tips, all that Fats will let you keep, and I'll get us a stake. It's my turn."

"How?"

"Lots of ways. You can forget it."

"Well… all right. Say, Sam, just what did you mean when you—I mean, well, suppose I did want to marry Ellie—I don't of course; she's just a kid and anyhow I'm not the type to marry—but just supposing? Why should anybody care?"

Sam looked surprised. "You don't know?"

"Why would I be asking?"

"You don't know who she is?"

"Huh? Her name's Eldreth Coburn and she's on her way home to Hespera, she's a colonial. What of it?"

"You poor boy! She didn't mention that she is the only daughter of His Supreme Excellency, General Sir John FitzGerald Coburn, O.B.E., K.B., O.S.U., and probably X.Y.Z., Imperial Ambassador to Hespera and Resident Commissioner Plenipotentiary?"

"*Huh?* Oh my gosh!"

"Catch on, kid? With the merest trifle of finesse you can be a remittance man, at least. Name your own planet, just as long as it isn't Hespera."

"Oh, go boil your head! She's a nice kid anyhow."

Sam snickered. "She sure is. As grandpop used to say, 'It's an ill wind that gathers no moss.'"

The knowledge disturbed Max. He had realized that Eldreth must be well to do—she was a passenger, wasn't she? But he had no awe of wealth. Achievement as exemplified by his uncle held much more respect in his eyes. But the notion that Eldreth came from such an impossibly high stratum—and that he, Maximilian Jones, was considered a fortune-hunter and social climber on that account—was quite upsetting.

He decided to put an end to it. He started by letting his work pile up so that he could say truthfully that he did not have time to play three-dee chess. So Ellie pitched in and helped him. While he was playing the unavoidable game that followed he attempted a direct approach. "See here, Ellie, I don't think you ought to stay down here and play three-dee chess with me. The other passengers come down to see their pets and they notice. They'll gossip."

"Pooh!"

"I mean it. Oh, you and I know it's all right, but it doesn't look right."

She stuck out her lower lip. "Am I going to have trouble with you? You talk just like Miss Mimsey."

"You can come down to see Chipsie, but you'd better come down with one of the other pet owners."

She started to make a sharp answer, then shrugged, "Okay, this isn't the most comfortable place anyhow. From now on we play in Bifrost Lounge, afternoons when your work is done and evenings."

Max protested that Mr. Giordano would not let him; she answered quickly, "Don't worry about your boss. I can twist him around my little finger." She illustrated by gesture.

The picture of the gross Mr. Gee in such a position slowed up Max's answer, but he finally managed to get out, "Ellie, crew members can't use the passenger lounge. It's..."

"They can so. More than once, I've seen Mr. Dumont having a cup of coffee there with Captain Blaine."

"You don't understand. Mr. Dumont is almost an officer, and if the Captain wants him as his guest, well, that's the Captain's privilege."

"You'd be my guest."

"No, I wouldn't be." He tried to explain to her the strict regulation that crew members were not to associate with passengers. "The Captain would be angry if he could see us right now—not at you, at me. If he caught me in the passengers' lounge he'd kick me all the way clown to 'H' deck."

"I don't believe it."

"But… " He shrugged. "All right. I'll come up this evening. He won't kick me, actually; that would be beneath him. He'll just send Mr. Dumont over to tell me to leave, then he'll send for me in the morning. I don't mind being fined a month's pay if that is what it takes to show you the way things are."

He could see that he had finally reached her. "Why, I think that's perfectly rotten! Everybody is equal. Everybody! That's the law."

"They are? Only from on top."

She got up suddenly and left. Max again had to soothe Mr. Chips, but there was no one to soothe him. He decided that the day that he and Sam disappeared over a horizon and lost themselves could not come too soon.

Eldreth returned next day but in company with a Mrs. Mendoza, the devoted owner of a chow who looked much like her. Eldreth treated Max with the impersonal politeness of a lady "being nice" to servants, except for a brief moment when Mrs. Mendoza was out of earshot.

"Max?"

"Yes, Miss?"

"I'll 'Yes, Miss' you! Look, Max, what was your uncle's name? Was it *Chester* Jones?"

"Why, yes, it was. But why…"

"Never mind." Mrs. Mendoza rejoined them. Max was forced to drop it.

The following morning the dry-stores keeper sought him out. "Hey, Max! The Belly wants you. Better hurry—I think you're in some sort of a jam."

Max worried as he hurried. He couldn't think of anything he had done lately; he tried to suppress the horrid fear that Ellie was involved.

It was clear that Mr. Giordano was not pleased but all that he said was, "Report to the Purser's Office. Jump." Max jumped.

The Purser was not there; Mr. Kuiper received him and looked him over with a cold eye. "Put on a clean uniform and make it quick. Then report to the Captain's cabin."

Max stood still and gulped. Mr. Kuiper barked, "Well? Move!"

"Sir," Max blurted, "I don't know where the Captain's cabin is."

"What? I'll be switched! Able deck, radius nine oh and outboard." Max moved.

The Captain was in his cabin. With him was Mr. Samuels the Purser, Mr. Walther the First Officer, and Dr. Hendrix the Astrogator. Max concluded that whatever it was he was about to be tried for, it could be nothing trivial. But he remembered to say, "Steward's Mate Third Class Jones reporting, sir."

Captain Blaine looked up. "Oh, yes. Find a chair." Max found one, sat down on the edge of it. The Captain said to the First Officer, "Under the circumstances, Dutch, I suppose it's the best thing to do—though it seems a little drastic. You agree, Hal?"

The Purser agreed. Max wondered just how drastic it was and whether he would live through it.

"We'll log it as an exception, then, Doc, and I'll write up an explanation for the board. After all, regulations were made to be broken. That's the end of it." Max decided that they were simply going to space him and explain it later.

The Captain turned back to his desk in a manner that signified that the meeting was over. The First Officer cleared his throat. "Captain… " He indicated Max with his eyes.

Captain Blaine looked up again. "Oh, yes! Young man, your name is Jones?"

"Yessir."

"I've been looking over your record. I see that you once tried out for chartsman for a short time in the *Thule?*"

"Uh, yes, Captain."

"Didn't you like it?"

"Well, sir." Max asked himself what Sam would say when confronted by such a ghost. "It was like this… to tell you the truth I didn't do much except empty ash trays in the Worry—in the control room." He held his breath.

The Captain smiled briefly. "It can sometimes work out that way. Would you be interested in trying it again?"

"What? Yes, *sir!*"

"Dutch?"

"Captain, ordinarily I see no point in a man striking twice for the same job. But there is this personal matter."

"Yes, indeed. You can spare him, Hal?"

"Oh, certainly, Captain. He's hardly a key man where he is." The Purser smiled. "Bottom deck valet."

The Captain smiled and turned to the Astrogator. "I see no objection, Doc. It's a guild matter, of course."

"Kelly is willing to try him. He's short a man, you know."

"Very well, then…"

"Just a moment, Captain." The Astrogator turned to Max. "Jones… you had a relative in my guild?"

"My uncle, sir. Chester Jones."

"I served under him. I hope you have some of his skill with figures."

"Uh, I hope so, sir."

"We shall see. Report to Chief Computerman Kelly."

Max managed to find the control room without asking directions, although he could hardly see where he was going.

9 — CHARTSMAN JONES

The change in Max's status changed the whole perspective of his life. His social relations with the other crew members changed not entirely for the better. The control room gang considered themselves the gentry of the crew, a status disputed by the power technicians and resented by the stewards. Max found that the guild he was leaving no longer treated him quite as warmly while the guild for which he was trying out did not as yet accept him.

Mr. Gee simply ignored him—would walk right over him if Max failed to jump aside. He seemed to regard Max's trial promotion as a personal affront.

It was necessary for him to hit the slop chest for dress uniforms. Now that his duty station was in the control room, now that he must pass through passengers' country to go to and from work, it was no longer permissible to slouch around in dungarees. Mr. Kuiper let him sign for them; his cash would not cover it. He had to sign as well for the cost of permission to work out of his guild, with the prospect of going further in debt to both guilds should he be finally accepted. He signed cheerfully.

The control department of the *Asgard* consisted of two officers and five men—Dr. Hendrix the Astrogator, his assistant astrogator Mr. Simes, Chief Computerman Kelly, Chartsman First Class Kovak, Chtsmn 2/C Smythe, and computermen Noguchi and Lundy, both second class. There was also "Sack" Bennett, communicator first class, but he was not really a part of the control gang, even though his station was in the Worry Hole; a starship was rarely within radio range of anything except at the very first and last parts of a trip.

Bennett doubled as Captain Blaine's secretary and factotum and owed his nickname to the often-stated belief of the others that he spent most of his life in his bunk.

Since the *Asgard* was always under boost a continuous watch was kept; not for them were the old, easy days of rocket ships, with ten minutes of piloting followed by weeks of free fall before more piloting was required. Since the *Asgard* carried no apprentice astrogator, there were only two officers to stand watches (Captain Blaine was necessarily an astrogator himself, but skippers do not stand watches); this lack was made up by Chief Computerman Kelly, who stood a regular watch as control officer-of-thewatch. The other ratings stood a watch in four; the distinction between a computerman and a chartsman was nominal in a control room dominated by "Decimal Point" Kelly—what a man didn't know he soon learned, or found another ship.

Easy watches for everyone but Max—he was placed on watch-and-watch for instruction, four hours on followed by four hours off in which he must eat, keep himself clean, relax, and—if he found time—sleep.

But he thrived on it, arriving early and sometimes having to be ordered out of the Worry Hole. Not until much later did he find out that this stiff regime was Kelly's way of trying to break him, discover his weakness and get rid of him promptly if he failed to measure up.

Not all watches were pleasant. Max's very first watch was under Mr. Simes. He crawled up the hatch into the control room and looked around him in wonderment. On four sides were the wonderfully delicate parallax cameras. Between two of them Lundy sat at the saddle of the main computer; he looked up and nodded but did not speak. Mr. Simes sat at the control console, facing the hatch; he must have seen Max but gave no sign of it.

There were other instruments crowded around the walls, some of which Max recognized from reading and from seeing pictures, some of which were strange—telltales and gauges from each of the ship's compartments, a screen to reproduce the view aft or "below," microphone and controls for the ship's announcing system, the "tank" or vernier stereograph in which plates from the parallax cameras could be compared with charts, spectrostellograph, dopplerscope, multipoint skin temperature recorder, radar repeater for landing, too many things to take in at once.

Overhead through the astrogation dome was the starry universe. He stared at it, mouth agape. Living as he had been, inside a steel cave, he had hardly seen the stars; the firmament had been more with him back home on the farm.

"Hey! You!"

Max shook his head and found Mr. Simes looking at him. "Come here." Max did so, the assistant astrogator went on, "Don't you know enough to report to the watch officer when you come on duty?"

"Uh—sorry, sir."

"Besides that, you're late." Max slid his eyes to the chronometer in the console; it still lacked five minutes of the hour. Simes continued, "A sorry state of affairs when crewmen relieve the watch later than the watch officer. What's your name?"

"Jones, sir."

Mr. Simes sniffed. He was a red-faced young man with thin, carroty hair and a sniff was his usual conversational embellishment, at least with juniors. "Make a fresh pot of coffee."

"Aye aye, sir." Max started to ask where and how, but Mr. Simes had gone back to his reading. Max looked helplessly at Lundy, who indicated a direction with his eyes. Behind the chart safe Max found a coffee maker and under it cups, saucers, sugar, and tins of cream.

He burned himself before getting the hang of the gear's idiosyncrasies. Mr. Simes accepted the brew without looking at him. Max wondered what to do next, decided to offer a cup to Lundy. The computerman thanked him quietly and Max decided to risk having one himself, since it seemed to be accepted. He took it over beside the computer to drink it.

He was still doing so when the watch officer spoke up. "What is this? A tea party? Jones!"

"Yes, sir?"

"Get the place policed up. Looks as if a herd of chucks had been wallowing in it."

The room seemed clean, but Max found a few scraps of paper to pick up and stuff down the chute, after which he wiped already-gleaming brightwork. He had started to go over things a second time when Lundy motioned him over. Max then helped Lundy change plates in the parallax cameras and watched him while he adjusted the electronic timer. Mr. Simes pushed the ready button himself, which seemed to be his sole work during the watch.

Lundy removed the plates and set them up in the tank for chart comparison, took the readings and logged them. Max gave him nominal help and gathered some notion of how it was done, after which he again wiped brightwork.

It was a long watch. He went to his bunk drained of the elation he had felt.

But watches with Dr. Hendrix and with Chief Kelly were quite different. The Worry Hole was a jolly place under Kelly; he ruled as a benevolent tyrant, shouting, cursing, slandering the coffee, slurring his juniors and being sassed back. Max never touched a polish rag when

Kelly was at control; he was kept too busy not merely helping but systematically studying everything in the room. "We haven't a condemned thing to do," Kelly shouted at him, "until we hit Carson's Folly. Nothing to do but to ride this groove down until we hit dirt. So you, my laddy buck, are going to do plenty. When we get there you are going to know this condemned hole better than your mother knew your father—or you can spend your time there learning what you've missed while your mates are dirtside getting blind. Get out the instruction manual for the main computer, take off the back plate and get lost in them wires. I don't want to see anything but your ugly behind the rest of this watch."

Within ten minutes Kelly was down on his knees with him, helping him trace the intricate circuits.

Max learned, greatly assisted by his photographic memory and still more by the sound grounding in theory he had gotten from his uncle. Kelly was pleased. "I reckon you exaggerated a mite when you said you hadn't learned anything in the *Thule*."

"Well, not much."

"Johansen have the Worry Hole when you were striking?"

"Uh, yes." Max hoped frantically that Kelly would not ask other names.

"I thought so. That squarehead wouldn't tell his own mother how old he was."

There came a watch when Kelly trusted him to do a dry run for a transition approach on the computer, with Noguchi handling the tables and Kelly substituting for the astrogator by following records of the actual transition the ship had last made. The programming was done orally, as is the case when the astrogator is working under extreme pressure from latest data, just before giving the crucial signal to boost past the speed of light.

Kelly took it much more slowly than would happen in practice, while Noguchi consulted tables and called out figures to Max. He was nervous at first, his fingers trembling so that it was hard to punch the right keys—then he settled down and enjoyed it, feeling as if he and the machine had been born for each other.

Kelly was saying, "—times the binary natural logarithm of zero point eight seven oh nine two." Max heard Noguchi's voice call back the datum while he thumbed for the page—but in his mind Max saw the page in front of his eyes long before Noguchi located it; without conscious thought he depressed the right keys.

"Correction!" sang out Kelly. "Look, meathead, you don't put in them figures; you wait for translation by Noggy here. How many times I have to tell you?"

"But I did—" Max started, then stopped. Thus far he had managed to keep anyone aboard the *Asgard* from learning of his embarrassingly odd memory.

"You did what?" Kelly started to clear the last datum from the board, then hesitated. "Come to think of it, you can't possibly feed decimal figures into that spaghetti mill. Just what *did* you do?"

Max knew he was right and hated to appear not to know how to set up a problem. "Why, I put in the figures Noguchi was about to give me."

"How's that again?" Kelly stared at him. "You a mind reader?"

"No. But I put in the right figures."

"Hmm… " Kelly bent over the keyboard. "Call 'em off, Noggy." The computerman reeled off a string of ones and zeroes, the binary equivalent of the decimal expression Kelly had given him; Kelly checked the depressed keys, his lips moving in concentration. He straightened up. "I once saw a man roll thirteen sevens with honest dice. Was it fool luck, Max?"

"No."

"Well! Noggy, gimme that book." Kelly went through the rest of the problem, giving Max raw data and the operations to be performed, but not translating the figures into the binary notation the computer required. He kept thumbing the book and glancing over Max's shoulder. Max fought off stage fright and punched the keys, while sweat poured into his eyes.

At last Kelly said, "Okay. Twist its tail." Max flipped the switch which allowed the computer to swallow the program and worry it for an instant; the answer popped out in lights, off or on—the machine's equivalent of binary figures.

Kelly translated the lights back into decimal notation, using the manual. He then glanced at the recorded problem. He closed the record book and handed it to Noguchi. "I think I'll have a cup of coffee," he said quietly and walked away.

Noguchi reopened it, looked at the lights shining on the board and consulted the manual, after which he looked at Max very oddly. Max saw Kelly staring at him over a cup with the same expression. Max reached up and cleared the board entirely; the lights went out. He got down out of the computerman's saddle. Nobody said anything.

Max's next watch was with Dr. Hendrix. He enjoyed watches with the Astrogator almost as much as those with Kelly; Dr. Hendrix was a friendly and soft-spoken gentleman and gave as much attention to training Max as Kelly did. But this time Kelly lingered on after being relieved—in itself nothing, as the Chief Computerman frequently consulted with, or simply visited with, the Astrogator at such times. But today, after relieving the watch, Dr. Hendrix said pleasantly, "Kelly tells me that you are learning to use the computer, Jones?"

"Uh, yes, sir."

"Very well, let's have a drill." Dr. Hendrix dug out an old astrogation log and selected a transition-approach problem similar to the one Max had set up earlier. Kelly took the manual, ready to act as his "numbers boy"—but did not call the translations. Max waited for the first one; when it did not come, he read the figures from the page shining in his mind and punched them in.

It continued that way. Kelly said nothing, but wet his lips and checked what Max did each time the doctor offered a bit of the problem. Kovak watched from nearby, his eyes moving from actor to actor.

At last Dr. Hendrix closed the book. "I see," he agreed, as if it were an everyday occurrence. "Jones, that is an extremely interesting talent. I've read of such cases, but you are the first I have met. You've heard of Blind Tom?"

"No, sir."

"Perhaps the ship's library has an account of him." The Astrogator was silent for a moment. "I don't mean to belittle your talent, but you are not to use it during an actual maneuver. You understand why?"

"Yes, sir. I guess I do."

"Better say that you are not to use it unless you think an error has been made—in which case you will speak up at once. But the printed tables remain the final authority."

"Aye aye, sir."

"Good. See me, please, in my room when you come off watch."

It was "day time" by the ship's clocks when he went off watch. He went to the passageway outside Dr. Hendrix's room and waited; there Ellie came across him. "Max!"

"Oh. Hello, Ellie." He realized uncomfortably that he had not seen her since his tentative promotion.

"Hello he says!" She planted herself in front of him. "You're a pretty sight—with your bloodshot eyes matching the piping on your shirt. Where have you been? Too good for your old friends? You haven't even been to see Chipsie."

He had been, once, although he had not run into Ellie. He had not repeated the visit because the shipmate who had replaced him had not liked being assigned as chambermaid to cows, sheep, llamas, *et al.*; he had seemed to feel that it was Max's fault. "I'm sorry," Max said humbly, "but I haven't had time."

"A feeble excuse. Know what you are going to do now? You're going straight to the lounge and I am going to trim your ears—I've figured out a way to box your favorite gambit that will leave you gasping."

Max opened his mouth, closed it, opened it again. "No."

"Speak louder. You used a word I don't understand."

"Look, Ellie, be reasonable. I'm waiting for Dr. Hendrix and as soon as he lets me go I've got to get some sleep. I'm about ten hours minus."

"You can sleep any time."

"Not when you're standing four hours on and four off. You nap anytime you get a chance."

She looked perplexed. "You don't mean you work every other watch? Why, that's criminal."

"Maybe so but that's how it is."

"But—I'll fix that! I'll speak to the Captain."

"Ellie! Don't you dare!"

"Why not? Captain Blaine is old sugar pie. Never you mind, I'll fix it."

Max took a deep breath, then spoke carefully. "Ellie, don't say anything to the Captain, not anything. It's a big opportunity for me and I don't mind. If you go tampering with things you don't understand, you'll ruin my chances. I'll be sent back to the stables."

"Oh, he wouldn't do that."

"You don't understand. He may be an 'old sugar pie' to you; to me he is the Captain. So don't."

She pouted. "I was just trying to help."

"I appreciate it. But don't. And anyhow, I can't come to the lounge, ever. It's off limits for me."

"But I thought—I think you're just trying to avoid me. You run around up here now and you dress in pretty clothes. Why not?"

They were interrupted by Dr. Hendrix returning to his room. "Morning, Jones. Good morning, Miss Coburn." He went on in.

Max said desperately, "Look, Ellie, I've got to go." He turned and knocked on the Astrogator's door.

Dr. Hendrix ignored having seen him with Ellie. "Sit down, Jones. That was a very interesting exhibition you put on." The Astrogator went on, "I'm curious to know how far your talent extends. Is it just to figures?"

"Why, I guess not, sir."

"Do you have to study hard to do it?"

"No, sir."

"Hmm… We'll try something. Have you read—let me see—any of the plays of Shakespeare?"

"Uh, we had *Hamlet* and *As You Like It* in school, and I read *A Winter's Tale*. But I didn't like it," he answered honestly.

"In that case I don't suppose you reread it. Remember any of it?"

"Oh, certainly, sir."

"Hmm—" Dr. Hendrix got down a limp volume.

"Let me see. Act two, scene three; Leontes says, 'Nor night nor day nor rest: it is but weakness... '"

Max picked it up. "... it is but weakness to bear the matter thus; mere weakness. If the cause were not in being... " He continued until stopped.

"That's enough. I don't care much for that play myself. Even the immortal Will had his off days. But how did you happen to have read that book of tables? Shakespeare at his dullest isn't that dull. I've never read them, not what one would call'reading.'"

"Well, sir, Uncle Chet had his astrogation manuals at home after he retired and he used to talk with me a lot. So I read them."

"Do I understand that you have memorized the entire professional library of an astrogator?"

Max took a deep breath. "Well, sir, I've read them."

Dr. Hendrix took from his shelves his own tools of his profession. He did not bother with the binary tables, that being the one Max had shown that he knew. He leafed through them, asked Max questions, finally identifying what he wanted only by page number. He closed the last of them. "Whew!" he commented, and blinked. "While I am aware that there are numerous cases of your talent in the history of psychology, I must admit it is disconcerting to encounter one." He smiled. "I wonder what Brother Witherspoon would think of this."

"Sir?"

"Our High Secretary. I'm afraid he would be shocked; he has conservative notions about protecting the'secrets' of our profession."

Max said uncomfortably, "Am I likely to get into trouble, sir? I didn't know it was wrong to read Uncle's books."

"What? Nonsense. There are no'secrets' to astrogation. You use these books on watch, so does every member of the 'Worry' gang. The passengers can read them, for all I care. Astrogation isn't secret; it is merely difficult. Few people are so endowed as to be able to follow accurately the mathematical reasoning necessary to plan a—oh, a transition, let us say. But it suits those who bother with guild politics to make it appear an arcane art—prestige, you know." Dr. Hendrix paused and tapped on his chair arm. "Jones, I want you to understand me. Kelly thinks you may shape up."

"Uh, that's good, sir."

"But don't assume that you know more than he does just because you have memorized the books."

"Oh, no, sir!"

"Actually, your talent isn't necessary in the control room. The virtues needed are those Kelly has—unflagging attention to duty, thorough knowledge of his tools, meticulous care for details, deep loyalty to his job and his crew and his ship and to those placed over him professionally. Kelly doesn't need eidetic memory, ordinary good memory combined with intelligence and integrity are what the job takes—and that's what I want in my control room."

"Yes, sir."

The Astrogator hesitated. "I don't wish to be offensive but I want to add this. Strange talents are sometimes associated with ordinary, or even inferior, mentality—often enough so that the psychologists use the term '*idiot savant.*' Sorry. You obviously aren't an idiot, but you are not necessarily a genius, even if you can memorize the Imperial Encyclopedia. My point is: I am more interested in your horse sense and your attention to duty than I am in your phenomenal memory."

"Uh, I'll try, sir."

"I think you'll make a good chartsman, in time." Dr. Hendrix indicated that the interview was over; Max got up. "One more thing."

"Yes, sir?"

"There are excellent reasons of discipline and efficiency why crew members do not associate with passengers."

Max gulped. "I know, sir."

"Mind your P's and Q's. The members of my department are careful about this point—even then it is difficult."

Max left feeling deflated. He had gone there feeling that he was about to be awarded something—even a chance to become an astrogator. He now felt sweated down to size.

10 — GARSON'S PLANET

Max did not see much of Sam during the weeks following; the stiff schedule left him little time for visiting. But Sam had prospered.

Like all large ships the *Asgard* had a miniature police force, experienced ratings who acted as the First Officer's deputies in enforcing ship's regulations. Sam, with his talent for politics and a faked certfication as steward's mate first class, managed during the reshuffle following Max's transfer to be assigned as master-at-arms for the Purser's department. He did well, treading on no toes, shutting his eyes to such violations as were ancient prerogatives and enforcing those rules of sanitation, economy, and behavior which were actually needed for a taut, happy ship… all without finding it necessary to haul offenders up before the First Officer for punishment—which suited both Mr. Walther and the crew. When Stores Clerk Maginnis partook too freely of Mr. Gee's product and insisted on serenading his bunk mates, Sam merely took him to the galley and forced black coffee down him—then the following day took him down to 'H' deck, laid his own shield of office aside, and gave Maginnis a scientific going over that left no scars but deeply marked his soul. In his obscure past Sam had learned to fight, not rough house, not in the stylized mock combat of boxing, but in the skilled art in which an unarmed man becomes a lethal machine.

Sam had selected his victim carefully. Had he reported him Maginnis would have regarded Sam as a snoop, a mere busybody to be outwitted or defied, and had the punishment been severe he might have been turned into a permanent discipline problem—not forgetting that reporting Maginnis might also have endangered a sacred cow, Chief Steward Giordano. As it was, it turned Maginnis into Sam's strongest supporter and best publicist, as Maginnis's peculiar but not unique pride required him to regard the man who defeated him as "the hottest thing on two feet, sudden death in each hand, a *real* man! No nonsense about old Sam—try him yourself and see how *you* make out. Go on, I want to lay a bet."

It was not necessary for Sam to set up a second lesson.

A senior engineer's mate was chief master-at-arms and Sam's nominal superior; these two constituted the police force of their small town. When the technician asked to go back to power room watchstanding and was replaced by an engineer's mate third, it was natural that Walther should designate Sam as Chief Master-at-Arms.

He had had his eye on the job from the moment he signed on. Any police chief anywhere has powers far beyond those set forth by law. As long as Sam stayed well buttered up with Mr. Kuiper, Mr. Giordano, and (to a lesser extent) with Mr. Dumont, as long as he was careful to avoid exerting his authority in either the engineering spaces or the Worry Hole, he was the most powerful man in the ship—more powerful in all practical matters than the First Officer himself since he was the First Officer's visible presence.

Such was the situation when the ship grounded at Garson's Planet.

Garson's Planet appears to us to be a piece of junk left over when the universe was finished. It has a surface gravity of one-and-a-quarter, too much for comfort, it is cold as a moneylender's heart, and it has a methane atmosphere unbreathable by humans. With the sky swarming with better planets it would be avoided were it not an indispensable way station. There is only one survey Horst congruency near Earth's Sun and transition of it places one near Theta Centauri—and of the thirteen planets of that sun, Carson's Planet possesses the meager virtue of being least unpleasant.

But there are half a dozen plotted congruencies accessible to Theta Centauri, which makes Carson's Planet the inevitable crossroads for trade of the Solar Union.

Max hit dirt there just once, once was plenty. The colony at the space port, partly domed, partly dug in under the domes, was much like the Lunar cities and not unlike the burrows under any major Earth city, but to Max it was novel since he had never been on Luna and had never seen a big city on Terra other than Earthport. He went dirtside with Sam, dressed in his best and filled with curiosity. It was not necessary to put on a pressure suit; the port supplied each passenger liner with a pressure tube from ship's lock to dome lock.

Once inside Sam headed down into the lower levels. Max protested, "Sam, let's go up and look around."

"Huh? Nothing there. A hotel and some expensive shops and clip joints for the pay passengers. Do you want to pay a month's wages for a steak?"

"No. I want to see *out*. Here I am on a strange planet and I haven't *seen* it at all. I couldn't see it from the control room when we landed and now I haven't seen anything but the inside of a trans tube and this." He gestured at the corridor walls.

"Nothing to see but a dirty, thick, yellow fog that never lifts. Worse than Venus. But suit yourself. I've got things to do, but if you don't want to stick with me you certainly don't have to."

Max decided to stick. They went on down and came out in a wide, lighted corridor not unlike that street in Earthport where Percy's restaurant was located, save that it was roofed over. There were the same bars, the same tawdry inducements for the stranger to part with cash, even to the tailor shop with the permanent "CLOSING OUT" sale. Several other ships were in and the sector was crowded. Sam looked around. "Now for a place for a quiet drink and a chat."

"How about there?" Max answered, pointing to a sign reading THE BETTER 'OLE. "Looks clean and cheerful."

Sam steered him quickly past it. "It is," he agreed, "but not for us."

"Why not?"

"Didn't you notice the customers? Imperial Marines."

"What of that? I've got nothing against the Imperials."

"Mmm… no," Sam agreed, still hurrying, "but those boys stick together and they have a nasty habit of resenting a civilian who has the bad taste to sit down in a joint they have staked out. Want to get your ribs kicked in?"

"Huh? That wouldn't happen if I minded my own business, would it?"

"Maybe. Maybe not. Suppose a hostess decides that you're 'cute'—and the spit-and-polish boy she was with wants to make something of it? Max, you're a good boy—but there just ain't no demand for good boys. To stay out of trouble you have to stay away from it."

They threaded their way through the crowd for another hundred yards before Sam said, "Here we are—provided Lippy is still running the place." The sign read THE SAFE LANDING; it was larger but not as pleasant as THE BETTER 'OLE.

"Who's Lippy?"

"You probably won't meet him." Sam led the way in and picked out a table.

Max looked around. It looked like any other fifth-rate bar grille. "Could I get a strawberry soda here? I've had a hankering for one for ages—I used always to get one Saturdays when I went to the Corners."

"They can't rule you out for trying."

"Okay. Sam, something you said—you remember the story you told me about your friend in the Imperials? Sergeant Roberts?"

"Who?"

"Or Richards. I didn't quite catch it."

"Never heard of the guy."

"But..."

"Never heard of him. Here's the waiter."

Nor had the humanoid Sirian waiter heard of strawberry soda. He had no facial muscles but his back skin crawled and rippled with embarrassed lack of comprehension. Max settled for something called "Old Heidelberg" although it had never been within fifty lightyears of Germany. It tasted to Max like cold soap suds, but since Sam had paid for it he nursed it along and pretended to drink it.

Sam bounced up almost at once. "Sit tight, kid. I won't be long." He spoke to the barman, then disappeared toward the back. A young woman came over to Max's table.

"Lonely, spaceman?"

"Uh, not especially."

"But *I* am. Mind if I sit down?" She sank into the chair that Sam had vacated.

"Suit yourself. But my friend is coming right back."

She didn't answer but turned to the waiter at her elbow. "A brown special, Giggles."

Max made an emphatic gesture of denial. "No!"

"What's that, dear?"

"Look," Max answered, blushing, "I may look green as paint—I am, probably. But I don't buy colored water at house prices. I don't have much money."

She looked hurt. "But you have to order or I can't sit here."

"Well... " He glanced at the menu. "I could manage a sandwich, I guess."

She turned again to the waiter. "Never mind the special, Giggles. A cheese on rye and plenty of mustard." She turned back to Max. "What's your name, honey?"

"Max."

"Mine's Dolores. Where are you from?"

"The Ozarks. That's Earthside."

"Now isn't that a coincidence! I'm from Winnipeg—we're neighbors!"

Max decided that it might appear so, from that distance. But as Dolores babbled on it became evident that she knew neither the location of the Ozarks nor that of Winnipeg, had probably never been on Terra in her life. She was finishing the sandwich while telling Max that she just adored spacemen, they were so romantic, when Sam returned.

He looked down at her. "How much did you take him for?"

Dolores said indignantly, "That's no way to talk! Mr. Lipski doesn't permit…"

"Stow it, kid," Sam went on, not unkindly. "You didn't know that my partner is a guest of Lippy. Get me? No'specials,' no 'pay-me's'—you're wasting your time. Now how much?"

Max said hastily, "It's okay, Sam. All I bought her was a sandwich."

"Well… all right. But you're excused, sister. Later, maybe."

She shrugged and stood up. "Thanks, Max."

"Not at all, Dolores. I'll say hello to the folks in Winnipeg."

"Do that."

Sam did not sit down. "Kid, I have to go out for a while."

"Okay."

Max started to rise, Sam motioned him back. "No, no. This I'd better do by myself. Wait here, will you? They won't bother you again—or if they do, ask for Lippy."

"I won't have any trouble."

"I hope not." Sam looked worried. "I don't know why I should fret, but there is something about you that arouses the maternal in me. Your big blue eyes I guess."

"Huh? Oh, go sniff space! Anyway, my eyes are brown."

"I was speaking," Sam said gently, "of the eyes of your dewy pink soul. Don't speak to strangers while I'm gone."

Max used an expression he had picked up from Mr. Gee; Sam grinned and left.

But Sam's injunction did not apply to Mr. Simes. Max saw the assistant astrogator appear in the doorway. His face was redder than usual and his eyes looked vague. He let his body revolve slowly as he surveyed the room. Presently his eyes lit on Max and he grinned unpleasantly.

"Well, well, well!" he said as he advanced toward Max. "If it isn't the Smart Boy."

"Good evening, Mr. Simes." Max stood up.

"So it's 'good evening, Mr. Simes'! But what did you say under your breath?'

"Nothing, sir."

"Humph! I know! But I think the same thing about you, only worse." Max did not answer, Simes went on, "Well, aren't you going to ask me to sit down?"

"Have a seat, sir," Max said without expression.

"Well, what do you know? The Smart Boy wants me to sit with him." He sat, called the waiter, ordered, and turned back to Max. "Smart Boy, do you know why I'm sitting with you?"

"No, sir."

"To put a flea in your ear, that's why. Since you pulled that hankypanky with the computer, you've been Kelly's hair-faired—fair-haired—boy. Fair-haired boy," he repeated carefully. "That gets you nowhere with me. Get this straight: you go sucking around the Astrogator the way Kelly does and I'll run you out of the control room. Understand me?"

Max felt himself losing his temper. "What do you mean by 'hankypanky,' Mr. Simes?"

"You know. Probably memorized the last half dozen transitions—now you've got Kelly and the Professor thinking you've memorized the book. A genius in our midst! You know what that is? That's a lot of…"

Fortunately for Max they were interrupted; he felt a firm hand on his shoulder and Sam's quiet voice said, "Good evening, Mr. Simes."

Simes looked confused, then recognized Sam and brightened. "Well, if it isn't the copper. Sit down, Constable. Have a drink."

"Don't mind if I do." Sam pulled up another chair.

"Do you know Smart Boy here?"

"I've seen him around."

"Keep your eye on him. That's an order. He's very, very clever. Too clever. Ask him a number. Pick a number between one and ten."

"Seven."

Mr. Simes pounded the table. "What did I tell you? He memorized it before you got here. Someday he's going to memorize one and they'll stencil it across his chest. You know what, Constable? I don't trust smart boys. They get ideas."

Reinforced by Sam's calming presence Max kept quiet. Giggles had come to the table as soon as Sam joined them; Max saw Sam write something on the back of a menu and pass it with money to the humanoid. But Mr. Simes was too busy with his monologue to notice. Sam let him ramble on, then suddenly interrupted. "You seem to have a friend here, sir."

"Huh? Where?"

Sam pointed. At the bar Dolores was smiling and gesturing at the assistant navigator to join her. Simes focused his eyes, grinned and said, "Why, so I do! It's my Great Aunt Sadie." He got up abruptly.

Sam brushed his hands together. "That disposes of that. Give you a bad time, kid?"

"Sort of. Thanks, Sam. But I hate to see him dumped on Dolores. She's a nice kid."

"Don't worry about her. She'll roll him for every thin he has on him—and a good job, too." His eyes became hard. "I like an officer who acts like an officer. If he wants to pin one on, he should do it in his own part of town. Oh, well." Sam relaxed. "Been some changes, eh, kid? Things are different from the way they were when we raised ship at Terra."

"I'll say they are!"

"Like it in the Worry gang?"

"It's more fun than I ever had in my life. And I'm learning fast—so Mr. Kelly says. They're a swell bunch—except for *him*." He nodded toward Simes.

"Don't let him worry you. The best soup usually has a fly in it. Just don't let him get anything on you."

"I sure don't intend to."

Sam looked at him, then said softly, "Ready to take the dive?"

"Huh?"

"I'm getting our stake together. We'll be all set."

Max found it hard to answer. He had known that his transfer had not changed anything basic; he was still in as much danger as ever. But he had been so busy with the joy of hard, interesting work, so dead for sleep when he was not working, that the subject had been pushed back in his mind. Now he drew patterns on the table in the sweat from the glasses and thought about it. "I wish," he said slowly, "that there was some way to beat it."

"There is a way, I told you. Your record gets lost."

Max raised his eyes. "What good would that do? Sure, it would get me another trip. But I don't want just another trip; I want to stay with it." He looked down at the table top and carefully sketched an hyperboloid. "I'd better go with you. If I go back to Terra, it's the labor companies for me—even if I stay out of jail."

"Nonsense."

"What?"

"Understand me, kid. I'd like to have you with me. A time like that, having a partner at your elbow is the difference between—well, being down in the dumps and being on top. But you can stay in space, with a record as clean as a baby's."

"Huh? How?"

"Because you are changing guilds. Now only *one* paper has to get lost—your strike-out record with the stewards, cooks, and clerks. And they will never miss it because you aren't on their books, anyhow. You start fresh with the chartsmen and computers, all neat and legal."

Max sat still and was tempted. "How about the report to the Department of Guilds and Labor?"

"Same thing. Different forms to different offices. I checked. One form gets lost, the other goes in—and Steward's Mate Jones vanishes into limbo while Apprentice Chartsman Jones starts a clean record."

"Sam, why don't *you* do it? With the drag you've got now you could switch to... uh, well, to..."

"To what?" Sam shook his head sadly. "No, old son, there is nothing I can switch to. Besides, there are reasons why I had better be buried deep." He brightened. "Tell you what—I'll pick my new name before I take the jump and tell you. Then some day, two years, ten, twenty, you'll lay over at Nova Terra and look me up. We'll split a bottle and talk about when we were young and gay. Eh?"

Max smiled though he did not feel happy. "We will, Sam. We surely will." Then he frowned. "But, Sam, I don't know how to wangle the deal—and you'll be gone."

"I'll fix it before I leave. I've got Nelson eating out of my hand now. Like this: half cash down and half on delivery—and I'll fix it so that you have something on him—never mind what; you don't need to know yet. When you ground at Earthport, he asks you to mail the reports because you are going dirtside and he has work to finish. You check to see that the two reports you want are there, then you give him his pay off. Done."

Max said slowly, "I suppose that's best."

"Quit fretting. Everybody has a skeleton in the closet; the thing is to keep 'em there and not at the feast." He pushed an empty glass aside. "Kid, would you mind if we went back to the ship? Or had you planned to make a night of it?"

"No, I don't mind." Max's elation at setting foot on his first strange planet was gone—Garson's Hole was, he had to admit, a sorry sample of the Galaxy.

"Then let's get saddled up. I've got stuff to carry and I could use help."

It turned out to be four fairly large bundles which Sam had cached in public lockers. "What are they?" Max asked curiously.

"Tea cozies, old son. Thousands of them. I'm going to sell 'em to Procyon pinheads as skull caps." Somewhat affronted, Max shut up.

Everything coming into the ship was supposed to be inspected, but the acting master-at-arms on watch at the lock did not insist on examining the items belonging to the Chief Master-at-Arms any more than he would have searched a ship's officer. Max helped Sam carry the bundles to the stateroom which was the prerogative of the ship's chief of police.

11 — "THROUGH THE CARGO HATCH"

From Garson's Planet to Halcyon around Nu Pegasi is a double dogleg of three transitions, of 105, 487, and 19 lightyears respectively to achieve a "straight line" distance of less than 250 lightyears. But neither straight-line distance nor pseudo-distance of transition is important; the *Asgard* covered less than a lightyear between gates. A distance "as the crow flies" is significant only to crows.

The first transition was barely a month out from Carson's Planet. On raising from there Kelly placed Max on a watch in three, assigning him to Kelly's own watch, which gave Max much more sleep, afforded him as much instruction (since the watch with Simes was worthless, instruction-wise), and kept Max out of Simes' way, to his enormous relief. Whether Kelly had planned that feature of it Max never knew—and did not dare ask.

Max's watch was still an instruction watch, he had no one to relieve nor to be relieved by. It became his habit not to leave the control room until Kelly did, unless told to do so. This resulted in him still being thrown into the company of Dr. Hendrix frequently, since the Astrogator relieved the Chief Computerman and Kelly would usually hang around and chat... during which time the Astrogator would sometimes inquire into Max's progress.

Occasionally the Captain would show up on Dr. Hendrix's watch. Shortly after leaving Garson's Planet Dr. Hendrix took advantage of one such occasion to have Max demonstrate for Captain Blaine and First Officer Walther his odd talent. Max performed without a mistake although the Captain's presence made him most selfconscious. The Captain watched closely with an expression of gentle surprise. Afterwards he said, "Thank you, lad. That was amazing. Let me see—what is your name?"

"Jones, sir."

"Jones, yes." The old man blinked thoughtfully. "It must be terrifying not to be able to forget—especially in the middle of the night. Keep a clear conscience, son."

Twelve hours later Dr. Hendrix said to him, "Jones, don't go away. I want to see you."

"Yes, sir."

The Astrogator spoke with Kelly for a few moments, then again spoke to Max. "The Captain was impressed by your vaudeville act, Jones. He is wondering whether you have any parallel mathematical ability."

"Well—no, sir. I'm not a lightning calculator, that is. I saw one in a sideshow once. He could do things I couldn't."

Hendrix brushed it aside. "Not important. I believe you told me that your uncle taught you some mathematical theory?"

"Just for astrogation, sir."

"What do you think I am talking about? Do you know how to compute a transition approach?"

"Uh, I think so, sir."

"Frankly, I doubt it, no matter how much theoretical drill Brother Jones gave you. But go ahead."

"*Now,* sir?"

"Try it. Pretend you're the officer of the watch. Kelly will be your assistant. I'll just be audience. Work the approach we are on. I realize that we aren't close enough for it to matter—but you are to assume that the safety of the ship depends on it."

Max took a deep breath. "Aye aye, sir." He started to get out fresh plates for the cameras.

Hendrix said, "No!"

"Sir?"

"If you have the watch, where's your crew? Noguchi, help him."

"Aye aye, sir." Noguchi grinned and came over. While they were bending over the first camera, Noguchi whispered, "Don't let him rattle you, pal. We'll give him a good show. Kelly will help you over the humps."

But Kelly did not help; he acted as "numbers boy" and nothing else, with no hint to show whether Max was right, or wildly wrong. After Max had his sights and had taken his comparison data between plates and charts he did not put the problem through the computer himself, but let Noguchi man the machine, with Kelly translating. After a long time and much sweat the lights blinked what he hoped was the answer.

Dr. Hendrix said nothing but took the same plates to the tank and started to work the problem again, with the same crew. Very quickly the lights blinked on again; the Astrogator took the tables from Kelly and looked up the translation himself. "We differ only in the ninth decimal place. Not bad."

"I was wrong only in the ninth place, sir?"

"I didn't say that. Perhaps I was more in error."

Max started to grin, but Dr. Hendrix frowned. "Why didn't you take doppler spectra to check?"

Max felt a cold chill. "I guess I forgot, sir."

"I thought you were the man who never forgot?"

Max thought intuitively—and correctly—that two kinds of memory were involved, but he did not have a psychologist's jargon with which to explain. One sort was like forgetting one's hat in a restaurant, that could happen to anyone; the other was being unable to recall what the mind had once known.

Hendrix went on, "A control room man must not forget things necessary to the safety of the ship. However as an exercise you solved it very well—except that you have no speed. Had we been pushing close to the speed of light, ready to cross, your ship would have been in Hades and crashed in the River Styx before you got the answer. But it was a good first try."

He turned away. Kelly jerked his head toward the hatch and Max went below.

As he was falling asleep Max turned over in his mind the notion that Dr. Hendrix might even be thinking of him for—Oh no! He put the thought aside. After all, Kelly could have done it; he had seen him do early approaches many times, and faster, too. Probably Noguchi could have done it.

Certainly Noguchi could have done it, he corrected. After all, there weren't any "secrets."

As they approached the first anomaly the easy watch in three for officers and watch in four for the men changed to watch-and-watch, with an astrogator, an assistant, a chartsman, and a computerman on each watch. Max was at last assigned to a regular watch; the first watch was Dr. Hendrix assisted by Chartsman 1/c Kovak, Max as chartsman of the watch and Noguchi on the computer; the other watch was Mr. Simes assisted by Chief Kelly, Smythe as chartsman and Lundy as computerman. Max noticed that Dr. Hendrix had assigned his "first team" to Simes and had taken the less experienced technicians himself. He wondered why, but was pleased not to be working for Simes.

He learned at last why they called it the "Worry Hole." Dr. Hendrix became a frozen-masked automaton, performing approach correction after correction and demanding quick, accurate, and silent service. During the last twenty hours of the approach the Astrogator never left the control room, nor did anyone else other than for short periods when nominally off watch. Simes continued to take his regular watch but Dr. Hendrix hung over him, checking everything that he did. Twice he required the junior astrogator to reperform portions of his work and once elbowed him aside and did it himself. The first time it happened Max stared—then he noticed that the others were careful to be busy doing something else whenever Dr. Hendrix spoke privately to Simes.

The tension grew as the critical instant approached. The approach to an anomalous intraspatial transition can hardly be compared to any other form of piloting ever performed by human beings, though it might be compared to the impossible trick of taking off in an atmosphere plane, flying a thousand miles blind—while performing dead reckoning so perfectly as to fly through a narrow tunnel at the far end, without ever seeing the tunnel. A Horst congruency cannot be seen, it can only be calculated by abstruse mathematics of effects of mass on space; a "gateway" is merely unmarked empty space in vaster emptiness. In approaching a planet an astrogator can see his destination, directly or by radar, and his speed is just a few miles per second. But in making a Horstian approach the ship's speed approaches that of light—and reaches it, at the last instant. The nearest landmarks are many billions of miles away, the landmarks themselves are moving with stellar velocities and appear to be crowding together in the exaggerated parallax effects possible only when the observer is moving almost as fast as is his single clue to location and speed—the wave fronts of the electromagnetic spectrum.

Like searching at midnight in a dark cellar for a black cat that isn't there.

Toward the last Kelly himself was on the computer with Lundy at his ear. Smythe and Kovak were charting, passing new data to Dr. Hendrix, who was programming orally to the computer crew, setting up the problems in his head and feeding them to the electronic brain almost without delay. The power room was under his direct control now; he had a switch led out from the control console in each hand, one to nurse the ship along just below speed of light, the other to give the *Asgard* the final kick that would cause her to burst through.

Max was pushed aside, no task remained in which there was not someone more experienced. On a different level, Simes too had been pushed aside; there was place for only one astrogator at the moment of truth.

Of all those in the Worry Hole only Captain Blaine seemed to be relaxed. He sat in the chair sacred to him, smoking quietly and watching Hendrix. The Astrogator's face was gray with fatigue, greasy with unwashed sweat. His uniform was open at the collar and looked slept in, though he certainly had not slept. Max looked at him and wondered why he had ever longed to be an astrogator, ever been foolish enough to wish to bear this undivided and unendurable burden.

But the doctor's crisp voice showed no fatigue; the endless procession of numbers marched out, sharp as print, each spoken so that there could be no mistake, no need to repeat, "nine" always sounded as one syllable, "five" always stretched into two. Max listened and learned and wondered.

He glanced up through the dome, out into space itself, space shown distorted by their unthinkable speed. The stars ahead, or above, had been moving closer together for the past several watches, the huge parallax effect displacing them to the eye so that they seemed to be retreating in the very sector of the sky they were approaching. They were seeing by infrared waves now, ploughing into oncoming wave trains so fast that doppler effect reduced heat wave lengths to visible light.

The flood of figures stopped. Max looked down, then looked up hastily as he heard Dr. Hendrix say, "Stand by!"

The stars seemed to crawl together, then instantly they were gone to be replaced without any lapse of time whatever by another, new and totally different starry universe.

Hendrix straightened up and sighed, then looked up. "There's the Albert Memorial," he said quietly. "And there is the Hexagon. Well, Captain, it seems we made it again." He turned to Simes. "Take it, Mister." He let the Captain go first, then followed him down the hatch.

The control gang went back to easy watches; the next transition was many days away. Max continued as chartsman-of -thewatch in place of Kovak, who temporarily replaced Dr. Hendrix while the Astrogator got a week of rest: There was truly not much to do during the early part of a leg and the doctor's superb skill was not needed. But Max greatly enjoyed the new arrangements; it made him proud to sign the rough log "M. Jones, Chtsmn o/W." He felt that he had arrived—even though Simes found fault with him and Kelly continued to drill him unmercifully in control room arts.

He was surprised but not apprehensive when he was told, during an offwatch period, to report to the Astrogator. He put on a fresh uniform, slicked his hair clown, and went above "C" deck. "Apprentice Chartsman Jones reporting, sir."

Kelly was there, having coffee with the Astrogator. Hendrix acknowledged Max's salutation but left him standing. "Yes, Jones." He turned to Kelly. "Suppose you break the news."

"If you say so, sir." Kelly looked uncomfortable. "Well, Jones, it's like this—you don't really belong in my guild."

Max was so shocked that he could not answer. He was about to say that he had thought—he had understood—he hadn't known—But he got nothing out; Kelly continued, "The fact is, you ought to buck for astrogator. The Doctor and I have been talking it over."

The buzzing in his head got worse. He became aware that Dr. Hendrix was repeating, "Well, Jones? Do you want to try it? Or don't you?"

Max managed to say, "Yes. Yes, sir."

"Good. Kelly and I have been watching you. He is of the opinion and so am I that you may, just possibly, have the latent ability to develop the skill and speed necessary. The question is: do *you* think so?"

"Uh… that is—I hope so, sir!"

"So do I," Hendrix answered dryly. 'We shall see. If you haven't, you can revert to your own guild and no harm is done. The experience will make you a better chartsman." The Astrogator turned to Kelly. "I'll quiz Jones a bit, Kelly. Then we can make up our minds."

"Very good, sir." Kelly stood up.

When the Chief Computerman had gone Hendrix turned to his desk, hauled out a crewman's personal record. To Max he said harshly, "Is this yours?"

Max looked at it and gulped. "Yes, sir."

Dr. Hendrix held his eye. "Well? How good a picture is it of your career thus far? Any comment you want to make?"

The pause might have been a dozen heart beats, though to Max it was an endless ordeal. Then a catharsis came bursting up out of him and he heard himself answering, "It's not a good picture at all, sir. It's phony from one end to the other."

Even as he said it, he wondered why. He felt that he had kicked to pieces his one chance to achieve his ambition. Yet, instead of feeling tragic, he felt oddly relaxed.

Hendrix put the personal record back on his desk. "Good," he answered. "Very good. If you had given any other answer, I would have run you out of my control room. Now, do you want to tell me about it? Sit down."

So Max sat down and told him. All that he held back was Sam's name and such details as would have identified Sam. Naturally Dr Hendrix noticed the omission and asked him point blank.

"I won't tell you, sir."

Hendrix nodded. "Very well. Let me add that I shall make no attempt to identify this, ah, friend of yours—if by chance he is in this ship."

"Thank you, sir."

There followed a considerable silence. At last Hendrix said, "Son, what led you to attempt this preposterous chicanery? Didn't you realize you would be caught?"

Max thought about it. "I guess I knew I would be, sir—eventually. But I wanted to space and there wasn't any other way to do it." When Hendrix did not answer Max went on. After the first relief of being able to tell the truth, he felt defensive, anxious to justify himself—and just a little bit irked that Dr. Hendrix did not see that he had simply done what he *had* to do—so it seemed to Max. "What would you have done, sir?"

"Me? How can I answer that? What you're really asking is: do I consider your actions morally wrong, as well as illegal?"

"Uh, I suppose so, sir."

"Is it wrong to lie and fake and bribe to get what you want? It's worse than wrong, it's undignified!"

Dr. Hendrix chewed his lip and continued. "Perhaps that opinion is the sin of the Pharisees... my own weakness. I don't suppose that a young, penniless tramp, such as you described yourself to be, can afford the luxury of dignity. As for the rest, human personality is a complex thing, nor am I a judge. Admiral Lord Nelson was a liar, a libertine, and outstandingly undisciplined. President Abraham Lincoln was a vulgarian and nervously unstable. The list is endless. No, Jones, I am not going to pass judgment; you must do that yourself. The authorities having jurisdiction will reckon your offenses; I am concerned only with whether or not you have the qualities I need."

Max's emotions received another shock. He had already resigned himself to the idea that he had lost his chance. "Sir?"

"Don't misunderstand me." Hendrix tapped the forged record. "I don't like this. I don't like it at all. But perhaps you can live down your mistake. In the meantime, I badly need another watch officer; if you measure up, I can use you. Part of it is personal, too; your uncle taught me, I shall try to teach you."

"Uh, I'll try, sir. Thank you."

"Don't thank me. I'm not even feeling particularly friendly to you, at the moment. Don't talk with anyone. I'll ask the Captain to call a guild meeting and he and Mr. Simes and I will vote on you. We'll make you a probationary apprentice which will permit the Captain to appoint you to the temporary rank of merchant cadet. The legalities are a bit different from those of the usual route as you no doubt know."

Max did not know, though he was aware that officers sometimes came up "through the cargo hatch"—but another point hit him. "Mr. Simes, sir?"

"Certainly. By this procedure, all the astrogators you serve with must pass on you."

"Uh, does it have to unanimous, sir?"

"Yes."

"Then—Well, sir, you might as well forget it. I mean, I appreciate your willingness to, uh, but… " His voice trailed off.

Dr. Hendrix smiled mirthlessly. "Hadn't you better let me worry about that?"

"Oh. Sorry, sir."

"When it has been logged, I'll notify you. Or 'when and if,' if you prefer."

"Yes, sir." Max stood up. "Sir? There were, uh, a couple of other things I wondered about."

Hendrix had turned back to his desk. He answered, "Well?" somewhat impatiently.

"Would you mind telling me—just for my curiosity—how you caught me?"

"Oh, that. No doubt you've given yourself away to several people. I'm sure Kelly knows, from the subjects he avoided. For example, I once heard Lundy mention to you Kiefer's Ritz on Luna. Your answer, though noncommittal, implied that you did not really know what dive he was talking about—and it is impossible for a spaceman not to know that place, its entrance faces the east lock to the space port."

"Oh."

"But the matter came to the top of my mind in connection with this." He again indicated the false record. "Jones, I deal in figures and my mind can no more help manipulating them for all the information they contain than I can help breathing. This record says that you went to space a year before your uncle retired—I remember what year that was. But you told me that your uncle had trained you at home and your performance bore out that statement. Two sets of alleged facts were contradictory; need I add that I was fairly sure of the truth?"

"Oh. I guess I wasn't very smart?'

"No, you weren't. Figures are sharp things, Jones. Don't juggle them, you'll get cut. What was the other matter?"

"Well, sir, I was kind of wondering what was going to happen to me. I mean about *that.*"

"Oh," Hendrix answered indifferently, "that's up to the Stewards & Clerks. My guild won't take action concerning a disciplinary matter of another guild. Unless, of course, they call it 'moral turpitude' and make it stick."

With that faint comfort Max left, Nevertheless he felt easier than he had at any time since he had signed on. The prospect of punishment seemed less a burden than constantly worrying about getting caught. Presently he forgot it and exulted in the opportunity—at last!—to take a crack at astrogator.

He wished he could tell Sam… or Ellie.

12 — HALCYON

The probationary appointment was logged later that same day. The Captain called him in, swore him in, then congratulated him and called him "Mister" Jones. The ceremony was simple, with no spectator but Hendrix and the Captain's secretary.

The commonplaces attendant on the change were, for a while, more startling to Max than the promotion itself. They started at once. "You had better take the rest of the day to shake down, Mr. Jones," the Captain said, blinking vaguely. "Okay, Doc?"

"Certainly, sir."

"Good. Bennett, will you ask Dumont to step in?"

The Chief Passengers' Steward was unblinkingly unsurprised to find the recent steward's mate third a ship's officer. To the Captain's query he said, "I was planning to put Mr. Jones in stateroom B-014, sir. Is that satisfactory?"

"No doubt, no doubt."

"I'll have boys take care of his luggage at once."

"Good. You trot along with Dumont, Mr. Jones. No, wait a moment. We must find you a cap." The Captain went to his wardrobe, fumbled around. "I had one that would do here somewhere."

Hendrix had been standing with his hands behind him. "I fetched one, Captain. Mr. Jones and I wear the same size, I believe."

"Good. Though perhaps his head has swelled a bit in the past few minutes. Eh?"

Hendrix grinned savagely. "If it has, I'll shrink it." He handed the cap to Max. The wide gold strap and sunburst the Astrogator had removed; substituted was a narrow strap with tiny sunburst surrounded by the qualifying circle of the apprentice. Max thought it must be old insignia saved for sentimental reasons by Hendrix himself. He choked up as he mumbled his thanks, then followed Dumont out of the Captain's cabin, stumbling over his feet.

When they reached the companionway Dumont stopped. "There is no need to go down to the bunkroom, sir. If you will tell me the combination of your locker, we'll take care of everything."

"Oh, gee, Mr. Dumont! I've got just a small amount of truck. I can carry it up myself."

Dumont's face had the impassivity of a butler's. "If I may make a suggestion, sir, you might like to see your stateroom while I have the matter taken care of." It was not a question; Max interpreted it correctly to mean: "*Look, dummy, I know the score and you don't. Do what I tell you before you make a terrible break*!"

Max let himself be guided. It is not easy to make the jump from crewman to officer while remaining in the same ship. Dumont knew this, Max did not. Whether his interest was fatherly, or simply a liking for correct protocol—or both—Dumont did not intend to allow the brand-new junior officer to go lower than "C" deck until he had learned to carry his new dignity with grace. So Max sought out stateroom B-014.

The bunk had a real foam mattress and a spread. There was a tiny wash basin with running water and a mirror. There was a bookshelf over the bunk and a wardrobe for his uniforms. There was even a shelf desk that let down for his convenience. There was a telephone on the wall, a buzzer whereby he could summon the steward's mate on watch! There was a movable chair all his own, a wastebasket, and—yes!—a little rug on the deck. And best of all, there was a door with a lock.

The fact that the entire room was about as large as a piano box bothered him not at all.

He was opening drawers and poking into things when Dumont returned. Dumont was not carrying Max's meager possessions himself; that task was delegated to one of his upper-decks staff. The steward's mate followed Dumont in and said, "Where shall I put this, sir?"

Max realized with sudden embarrassment that the man waiting on him had eaten opposite him for past months. "Oh! Hello, Jim. Just dump it on the bunk. Thanks a lot."

"Yes, sir. And congratulations!"

"Uh, thanks!" They shook hands. Dumont let that proper ceremony persist for a minimum time, then said, "That's all now, Gregory. You can go back to the pantry." He turned to Max. "Anything else, sir?"

"Oh, no, everything is fine."

"May I suggest that you probably won't want to sew insignia on these uniforms yourself? Unless you are better with a needle than I am," Dumont added with just the right chuckle.

"Well, I guess I could."

"Mrs. Dumont is handy with a needle, taking care of the lady passengers as she does. Suppose I take this one? It can be ready and pressed in time for dinner."

Max was happy to let him. He was suddenly appalled by a terrifying notion—he was going to have to eat in the Bifrost Lounge!

But there were further disturbances before dinner. He was completing the small task of stowing his possessions when there came a knock on the door, followed immediately by someone coming in. Max found himself nose to nose with Mr. Simes.

Simes looked at the cap on his head and laughed. "Take that thing off before you wear out your ears."

Max did not do so. He said, "You wanted me, sir?"

"Yes. Just long enough, Smart Boy, to give you a word of advice."

"Yes?"

Simes tapped himself on the chest. "Just this. There is only one assistant astrogator in this ship—and I'm it. Remember that. I'll still be it long after you've been busted back to sweeping up after cows. Which is where you belong."

Max felt a flush crawl up his neck and burn his cheeks. "Why," he asked, "if you think that, didn't you veto my appointment?"

Simes laughed again. "Do I look like a fool? The Captain says yes, the Astrogator says yes—should I stick my neck out? It's easier to wait and let you stick your neck out—which you will. I just wanted to let you know that a dinky piece of gold braid doesn't mean a thing. You're still junior to me by plenty. Don't forget it."

Max clenched his jaw and did not answer. Simes went on, "Well?"

"'Well' what?"

"I just gave you an order."

"Oh. Aye aye, Mr. Simes. I won't forget it. I certainly won't."

Simes looked at him sharply, said, "See that you don't," and left. Max was still facing his door, clenching his fists, when Gregory tapped on the door. "Dinner, sir. Five minutes."

Max delayed as long as he could, wishing mightily that he could slide down to Easy deck and take his usual place in the warm, noisy, relaxed comfort of the crew's mess. He hesitated in the lounge doorway, paralyzed with stage fright. The beautiful room was blazing with light and looked unfamiliar; he had never been in it save in early morning, to change the sandbox located down the pantry passage—at which times only standing lights were burning.

He was barely in time; some of the ladies were seated but the Captain was still standing. Max realized that he should be near his chair, ready to sit down when the Captain did—or as soon as the ladies were seated, he amended—but where should he go? He was still jittering when he heard his name shouted. "Max!"

Ellie came running up and threw her arms around his neck. "Max! I just heard. I think it's *wonderful!"* She looked at him, her eyes shining, then kissed him on both cheeks.

Max blushed to his ears. He felt as if every eye was turned on him—and he was right. To add to his embarrassment Ellie was dressed in formal evening dress of Hesperan high style, which not only made her look older and much more female, but also shocked his puritanical hillbilly standards.

She let go of him, which was well but left him in danger of collapsing at the knees. She started to babble something, Max did not know what, when Chief Steward Dumont appeared at her elbow. "The Captain is waiting, Miss," he said firmly.

"Bother to the Captain! Oh, well—see you after dinner, Max." She headed for the Captain's table. Dumont touched Max's sleeve and munnured, "This way, sir."

His place was at the foot of the Chief Engineer's table. Max knew Mr. Compagnon by sight but had never spoken to him. The Chief glanced up and said, "Evening, Mr. Jones. Glad to have you with us. Ladies and gentlemen, our new astrogation officer, Mr. Jones. On your right, Mr. Jones, is Mrs. Daigler. Mr. Daigler on her right, then—" and so on, around the table: Dr. and Mrs. Weberbauer and their daughter Rebecca, Mr. and Mrs. Scott, a Mr. Arthur, Senhor and Senhora Vargas.

Mrs. Daigler thought it was *lovely*, his being promoted. And so *nice* to have more young people at the table. She was much older than Max but young enough to be handsome and aware of it. She wore more jewels than Max had ever seen and her hair was lacquered into a structure a foot high and studded with pearls. She was as perfectly finished and as expensive as a precision machine and she made Max uncomfortable.

But he was not yet as uncomfortable as he could be. Mrs. Daigler produced a wisp of a handkerchief from her bosom, moistened it and said, "Hold still, Mr. Jones." She scrubbed his cheek. "Turn your head." Blushing, Max complied.

"There, that's better," Mrs. Daigler announced. "Mama fixed." She turned away and said, "Don't you think, Mr. Compagnon, that science, with all the wonderful things they do these days, could discover a lip paint that wouldn't come off?"

"Stop it, Maggie," her husband interrupted. "Pay no attention, Mr. Jones. She's got a streak of sadism as wide as she is."

"George, you'll pay for that. Well, Chief?"

The Chief Engineer patted his lips with snowy linen. "I think it must already have been invented, but there was no market. Women like to brand men, even temporarily."

"Oh, bosh!"

"It's a woman's world, ma'am."

She turned to Max. "Eldreth is a dear, isn't she? I suppose you knew her 'dirtside'?—as Mr. Compagnon calls it."

"No, ma'am."

"Then how? I mean, after all, there isn't much opportunity. Or is there?"

"Maggie, stop pestering him. Let the man eat his dinner."

Mrs. Weberbauer on his other side was as easy and motherly as Mrs. Daigler was difficult. Under her soothing presence Max managed to start eating. Then he noticed that the way he grasped a fork was not the way the others did, tried to change, made a mess of it, became aware of his untidy nails, and wanted to crawl under the table. He ate about three hundred calories, mostly bread and butter.

At the end of the meal Mrs. Daigler again gave her attention to him, though she addressed the Chief Engineer. "Mr. Compagnon, isn't it customary to toast a promotion?"

"Yes," the Chief conceded. "But he must pay for it. That's a requirement."

Max found himself signing a chit presented by Dumont. The price made him blink—his first trip might be a professional success, but so far it had been financial disaster. Champagne, iced in a shiny bucket, accompanied the chit and Dumont cut the wires and drew the cork with a flourish.

The Chief Engineer stood up. "Ladies and gentlemen—I give you Astrogator Jones. May he never misplace a decimal point!"

"Cheers!"—"Bravo!"—"Speech, speech!"

Max stumbled to his feet and muttered, "Thank you."

His first watch was at eight o'clock the next morning. He ate breakfast alone and reflected happily that as a watch stander he would usually eat either before or after the passengers. He was in the control room a good twenty minutes early.

Kelly glanced up and said, "Good morning, sir."

Max gulped. "Er—good morning, Chief!" He caught Smythe grinning behind the computer, turned his eyes hastily away.

"Fresh coffee, Mr. Jones. Will you have a cup?" Max let Kelly pour for him; while they drank Kelly quietly went over the details—acceleration schedule, position and vector, power units in use, sights taken, no special orders, *etc.* Noguchi relieved Smythe, and shortly before the hour Dr. Hendrix appeared.

"Good morning, sir."

"Good morning, Doctor."

"Morning." Hendrix accepted coffee, turned to Max. "Have you relieved the officer of the watch?"

"Uh, why no, sir."

"Then do so. It lacks less than a minute of eight."

Max turned to Kelly and shakily saluted. "I relieve you, sir."

"Very well, sir." Kelly went below at once. Dr. Hendrix sat down, took out a book and started to read. Max realized with a chilly feeling that he had been pushed in, to swim or not. He took a deep breath and went over to Noguchi. "Noggy, let's get the plates ready for the middle o' watch sights."

Noguchi glanced at the chronometer. "As you say, sir."

"Well… I guess it is early. Let's take a few dopplers."

"Aye aye, sir." Noguchi climbed out of the saddle where he had been loafing.

Max said in a low voice, "Look, Noggy, you don't have to say'sir' to me."

Noguchi answered just as quietly. "Kelly wouldn't like it if I didn't. Better let it ride."

"Oh." Max frowned. "Noggy? How does the rest of the Worry gang feel about it?"

Noguchi did not pretend not to understand. He answered, "Shucks, they're all rooting for you, if you can swing it."

"You're sure?"

"Certain. Just as long as you don't try to make a big hairy thing out of yourself like—well, like some I could mention." The computerman added, "Maybe Kovak isn't exactly cheering. He's been having a watch of his own, you know—for the first time."

"He's sore?"

"Not exactly. He couldn't expect to keep it long anyhow, not with a transition coming up. He won't go out of his way to give you trouble, he'll be fair."

Max made a mental note to see what he could do to swing Kovak over to his side. The two manned the dopplerscope, took readings on stars forward of vector, checked what they found by spectrostellograph, and compared both with standard plates from the chart safe. At first Max had to remember that he was in charge; then he got so interested in fussy details of measurements that he was no longer selfconscious. At last Noguchi touched his sleeve. "Pushing ten o'clock, sir. I'd better get set up."

"Huh? Sure, go ahead." He reminded himself not to help Noggy; the chartsman has his prerogatives, too. But he checked the set up just as Hendrix always did, as Simes rarely did, and as Kelly sometimes did, depending on who had made it.

After they had gotten the new data Max programmed the problem on paper (there being plenty of time), then called it off to Noguchi at the computer. He thumbed the book himself, there being no "numbers boy" available. The figures were as clear in his recollection as ever, but he obeyed Hendrix's injunction not to depend on memory.

The result worried him. They were not "in the groove." Not that the *Asgard* was far out, but the discrepancy was measurable. He checked what he had done, then had Noguchi run the problem again, using a different programming method. The result came out the same.

Sighing, he computed the correction and started to take it to Hendrix for approval. But the Astrogator still paid no attention; he sat at the console, reading a novel from the ship's library.

Max made up his mind. He went to the console and said, "Excuse me, sir. I need to get there for a moment." Hendrix got up without answering and found another seat. Max sat down and called the power room. "Control officer speaking. I intend to increase boost at eleven o'clock. Stand by for time check."

Hendrix must have heard him, he thought, but the Astrogator gave no sign. Max fed in the correction, set the control chronometer to execute his wishes at eleven plus-or-minus nothing.

Shortly before noon Simes showed up. Max had already written his own log, based on Noguchi's log, and had signed it "M. Jones." He had hesitated, then added "C. O. o/W." Simes went to Dr. Hendrix, saluted, and said, "Ready to relieve you, sir."

Hendrix spoke his first word since eight o'clock. "He's got it."

Simes looked non-plussed, then went to Max. "Ready to relieve you." Max recited off the situation data while Simes read the log and the order book. Simes interrupted him while he was still listing minor ship's data. "Okay, I relieve you. Get out of my control room, Mister." Max got out. Dr. Hendrix had already gone down.

Noguchi had loitered at the foot of the ladder. He caught Max's eye, made a circle with thumb and finger and nodded. Max grinned at him, started to ask a question; he wanted to know if that discrepancy was a booby trap, intentionally left in by Kelly. Then he decided that it would not be fitting; he'd ask Kelly himself, or figure it from the records. "Thanks, Noggy."

That watch turned out to be typical only in the one respect that Dr. Hendrix continued to require Max to be officer of the watch himself. He did not again keep quiet but rode Max steadily, drilling him hour after hour, requiring him to take sights and set up problems continuously, as if the *Asgard* were actually close to transition. He did not permit Max to program on paper but forced him to pretend that time was too short and that data must immediately go into the computer, be acted on at once. Max sweated, with remote controls in each fist and with Hendrix himself acting as "numbers boy." The Astrogator kept pushing him for speed, speed, and more speed—never at the sacrifice of accuracy, for any error was unforgivable. But the goal was always greater speed.

Once Max objected. "Sir, if you would let me put it right into the machine, I could cut it down a lot."

Hendrix snapped, "When you have your own control room, you can do that, if you think it wise. Now you'll do it *my* way."

Occasionally Kelly would take over as his supervisor. The Chief Computerman was formal, using such phrases as, "May I suggest, sir —" or "I think I'd do it this way, sir." But once he broke out with, "Confound it, Max! Don't ever pull a dumb stunt like that!"

Then he started to amend his remarks. Max grinned. "Please, Chief. For a moment you made me feel at home. Thanks."

Kelly looked sheepish. "I'm tired, I guess. I could do with a smoke and some java."

While they were resting Max noted that Lundy was out of earshot and said, "Chief? You know more than I'll ever learn. Why didn't *you* buck for astrogator? Didn't you ever get a chance?"

Kelly suddenly looked bleak. "I once did," he said stiffly. "Now I know my limitations." Max shut up, much embarrassed. Thereafter Kelly reverted to calling him Max whenever they were alone.

Max did not see Sam for more than a week after he moved up to Baker deck. Even then the encounter was chance; he ran across him outside the Purser's office. "Sam!"

"Good morning, sir!" Sam drew up in a smart salute with a broad grin on his face.

"Huh? 'Good morning, sir' my foot! How's it going, Sam?"

"Aren't you going to return my salute? In my official capacity I can report you, you know. The Captain is very, very fussy about ship's etiquette."

Max made a rude noise. "You can hold that salute until you freeze, you clown."

Sam relaxed. "Kid, I've been meaning to get up and congratulate you—but every time I find you're on watch. You must live in the Worry Hole."

"Pretty near. Look, I'll be off this evening until midnight. What do you say I stop down to see you?"

Sam shook his head. "I'll be busy."

"Busy how? You expecting a jail break? Or a riot, maybe?"

Sam answered soberly, "Kid, don't get me wrong—but you stick to your end of the ship and I'll stick to mine. No, no, keep quiet and listen. I'm as proud as if I had invented you. But you can't fraternize in crew's quarters, not even with the Chief Master-at-Arms. Not yet."

"Who'll know? Who's to care?"

"You know blamed well that Giordano would love to tell Kuiper that you didn't know how to behave like an officer—and Old Lady Kuiper would pass it along to the Purser. Take my advice. Have I ever thrown you a curve?"

Max dropped the matter, though he badly wanted a chin with Sam. He needed to tell him that his faked record had been breached and to consult with him as to probable consequences.

Of course, he considered as he returned to his stateroom, there wasn't a thing to keep him from carrying out his orginal intention of jumping ship with Sam at Nova Terra—except that it was now no longer possible to imagine it. He was an officer.

They were approaching the middle transition; the control room went on watch-and-watch. But still Dr. Hendrix did not take the watch; Simes and Jones alternated. The Astrogator stood every watch with Max but required him to do the work and carry the responsibility himself. Max sweated it out and learned that practice problems and study of theory were nothing like having it matter when he had no way and no time to check. You had to be *right*, every time—and there was always doubt.

When, during the last twenty-four hours, the Worry gang went on continuous watch, Max thought that Dr. Hendrix would push him aside. But he did not. Simes was pushed aside, yes, but Max took the worry seat, with Hendrix bending over him and watching everything he did, but not interfering. "Great heavens!" Max thought. "Surely he isn't going to let me make this transition? I'm not ready for it, not yet. I'll never keep up."

But data was coming too fast for further worry; he had to keep processing it, see the answers, and make decisions. It was not until twenty minutes before transition that Hendrix pushed him aside without a word and took over. Max was still recovering when they burst through into a new sky.

The last approach-and-transition before Halcyon was much like the second. There were a couple of weeks of easy watches, headed by Simes, Jones, and Kovak, with both Kelly and Hendrix getting a little rest. Max liked it, both on and off watch. On watch he continued to practice, trying to achieve the inhuman speed of Dr. Hendrix. Off watch he slept and enjoyed himself. The Bifrost Lounge no longer terrified him. He now played three-dee with Ellie there, with Chipsie on his shoulder, giving advice. Ellie had long since waved her eyes at Captain Blaine and convinced him that a pet so well behaved, so well housebroken, and in particular so well mannered (she had trained the spider puppy to say, "Good morning, Captain," whenever it saw Blaine)—in all respects so civilized should not be forced to live in a cage.

Max had even learned to swap feeble repartee with Mrs. Daigler, thinking up remarks and waiting for a chance. Ellie was threatening to teach him to dance, although he managed to stall her until resumption of watch-and-watch before transition made it impossible.

Again he found himself shoved into the worry seat for the last part of the approach. This time Dr. Hendrix did not displace him until less than ten minutes before burst through.

On the easy drop down to Halcyon Ellie's determination won out. Max learned to dance. He found that he liked it. He had good rhythm, did not forget her instructions, and Ellie was a fragrant, pleasant armful. "I've done all I can," she announced at last. "You're the best dancer with two left feet I've ever met." She required him to dance with Rebecca Weberbauer and with Mrs. Daigler. Mrs. Daigler wasn't so bad after all, as long as she kept her mouth shut—and Rebecca was cute. He began to look forward to the fleshpots of Halcyon, that being Ellie's stated reason for instructing him; he was to be conscripted as her escort.

Only one thing marred the final leg; Sam was in trouble. Max did not find out about it until after the trouble broke. He got up early to go on watch and found Sam cleaning decks in the silent passages of passenger quarters. He was in dungarees and wearing no shield. "Sam!"

Sam looked up. "Oh. Hi, kid. Keep your voice down, you'll wake people."

"But Sam, what in Ned are you doing?"

"Me? I seem to be manicuring this deck."

"But why?"

Sam leaned on his broom. "Well, kid, it's like this. The Captain and I had a difference of opinion. He won."

"You've been busted?"

"Your intuition is dazzling."

"What happened?"

"Max, the less you know about it the better. Don't fret. *Sic transit gloria mundi*—Tuesday is usually worse."

"But—See here, I've got to grab chow and go on watch. I'll look you up later."

"Don't."

Max got the story from Noguchi. Sam, it appeared, had set up a casino in an empty storeroom. He might have gotten away with it indefinitely had it remained a cards-and-dice set up, with a rake off for the house—the "house" being the Chief Master-at-Arms. But Sam had added a roulette wheel and that had been his downfall; Giordano had come to suspect that the wheel had less of the element of chance than was customary in better-run gambling halls—and had voiced his suspicion to Chief Clerk Kuiper. From there events took an inevitable course.

"When did he put in this wheel?"

"Right after we raised from Garson's Planet." Max thought uncomfortably of the "tea cozies" he had helped Sam bring aboard there. Noguchi went on, "Uh, didn't you know, sir? I thought you and him were pretty close before—you know, before you moved up decks."

Max avoided an answer and dug into the log. He found it under the previous day, added by Bennett to Simes' log. Sam was restricted to the ship for the rest of the trip, final disciplinary action postponed until return to Terra.

That last seemed to mean that Captain Blaine intended to give Sam a chance to show good behavior before making his recommendation to the guilds—the Captain was a sweet old guy, he certainly was. But "restricted"? Then Sam would never get his chance to run away from whatever it was he was running away from. He located Sam as soon as he was off watch, digging him out of his bunkroom and taking him out into the corridor.

Sam looked at him sourly. "I thought I told you not to look me up?"

"Never mind! Sam, I'm worried about you. This'restricted' angle... it means you won't have a chance to—"

"*Shut up!"* It was a whisper but Max shut up. "Now look here," Sam went on, "Forget it. I got my stake and that's the important point."

"But..."

"Do you think they can seal this ship tight enough to keep me in when I decide to leave? Now stay away from me. You're teacher's pet and I want to keep it that way. I don't want you lectured about bad companions, meaning me."

"But I want to help, Sam. I..."

"Will you kindly get up above 'C' deck where you belong?"

He did not see Sam again that leg; presently he stopped worrying about it. Hendrix required him to compute the planetary approach—child's play compared with a transition—then placed Max at the conn when they grounded. This was a titulary responsibility since it was precomputed and done on radar-automatic. Max sat with the controls under his hands, ready to override the autopilot—and Hendrix stood behind him, ready to override him—but there was no need; the *Asgard* came down by the plotted curve as easy as descending stairs. The thrust beams bit in and Max reported, "Grounded, sir, on schedule."

"Secure."

Max spoke into the ship's announcers. "Secure power room. Secure all space details. Dirtside routine, second section."

Of the four days they were there he spent the first three nominally supervising, and actually learning from, Kovak in the routine ninety-day inspection and overhaul of control room instruments. Ellie was vexed with him, as she had had different plans. But on the last day he hit dirt with her, chaperoned by Mr. and Mrs. Mendoza.

It was a wonderful holiday. Compared with Terra, Halcyon is a bleak place and Bonaparte is not much of a city. Nevertheless Halcyon is an earth-type planet with breathable air, and the party from the *Asgard* had not set foot outdoors since Earthport, months of time and unthinkable lightyears behind. The season was postaphelion, midsummer, Nu Pegasi burned warm and bright in blue sky. Mr. Mendoza hired a carriage and they drove out into green, rolling countryside behind four snuffling little Halcyon ponies. There they visited a native pueblo, a great beehive structure of mud, conoid on conoid, and bought souvenirs—two of which turned out to have "Made in Japan" stamped inconspicuously on them.

Their driver, Herr Eisenberg, interpreted for them. The native who sold the souvenirs kept swiveling his eyes, one after another, at Mrs. Mendoza. He twittered some remarks to the driver, who guffawed. "What does he say?" she asked.

"He was complimenting you."

"So? But how?"

"Well… he says you are for a slow fire and no need for seasoning; you'd cook up nicely. And he'd do it, too," the colonist added, "if you stayed here after dark."

Mrs. Mendoza gave a little scream. "You didn't tell us they were *cannibals*. Josie, take me back!"

Herr Eisenberg looked horrified. "Cannibals? Oh, no, lady! They don't eat each other, they just eat us—when they can get us, that is. But there hasn't been an incident in twenty years."

"But that's worse!"

"No, it isn't, lady. Look at it from their viewpoint. They're civilized. This old fellow would never break one of their laws. But to them we are just so much prime beef, unfortunately hard to catch."

"Take us back at once! Why, there are hundreds of them, and only five of us."

"Thousands, lady. But you are safe as long as Gneeri is shining." He gestured at Nu Pegasi. "It's bad juju to kill meat during daylight. The spirit stays around to haunt."

Despite his reassurances the party started back. Max noticed that Eldreth had been unfrightened. He himself had wondered what had kept the natives from tying them up until dark.

They dined at the Josephine, Bonaparte's best (and only) hotel. But there was a real three-piece orchestra, a dance floor, and food that was at least a welcome change from the menus of the Bifrost Lounge. Many ship's passengers and several officers were there; it made a jolly party. Ellie made Max dance between each course. He even got up his nerve to ask Mrs. Daigler for a dance, once she came over and suggested it.

During the intermission Eldreth steered him out on the adjacent balcony. There she looked up at him. "You leave that Daigler hussy alone, hear me?"

"Huh? I didn't do anything."

She suddenly smiled warmly. "Of course not, you big sweet ninny. But Ellie has to take care of you." She turned and leaned on the rail. Halcyon's early night had fallen, her three moons were chasing each other. The sky blazed with more stars than can be seen in Terra's lonely neighborhood. Max pointed out the strange constellations and showed her the departure direction they would take tomorrow to reach transition for Nova Terra. He had learned four new skies so far, knew them as well as he knew the one that hung over the Ozarks—and he would learn many more. He was already studying, from the charts, other skies they would be in this trip.

"Oh, Max, isn't it *lovely!*"

"Sure is. Say, there's a meteor. They're scarce here, mighty scarce."

"Make a wish! Make a wish quick!"

"Okay." He wished that he would get off easy when it came to the showdown. Then he decided that wasn't right; he ought to wish old Sam out of his jam—not that he believed in it, either way.

She turned and faced him. "What did you wish?"

"Huh?" He was suddenly selfconscious. "Oh, mustn't tell, that spoils it."

"All right. But I'll bet you get your wish," she added softly.

He thought for a moment that he could have kissed her, right then, if he had played his cards right. But the moment passed and they went inside. The feeling stayed with him on the ride back, made him elated. It was a good old world, even if there were some tough spots. Here he was, practically a junior astrogator on his first trip—and it hadn't been more than weeks since he was borrowing McAllister's mules to work the crop and going barefooted a lot to save shoes.

And yet here he was in uniform, riding beside the best-dressed girl in four planets.

He fingered the insignia on his chest. Marrying Ellie wasn't such an impossible idea now that he was an officer—if he ever decided to marry. Maybe her old man wouldn't consider an officer—and an astrogator at that—completely ineligible. Ellie wasn't bad; she had spunk and she played a fair game of three-dee—most girls wouldn't even be able to learn the rules.

He was still in a warm glow when they reached the ship and were hoisted in.

Kelly met him at the lock. "Mr. Jones—the Captain wants to see you."

"Huh? Oh. G'night, Ellie—I'll have to run." He hurried after Kelly.

"What's up?"

"Dr. Hendrix is dead."

13 — TRANSITION

Max questioned Kelly as they hurried up to the Captain's cabin.

"I don't know. I just don't know, Max." Kelly seemed close to tears. "I saw him before dinner—he came into the Hole to check what you and Kovak have been doing. He seemed all right. But the Purser found him dead in his bunk, the middle of the evening." He added worriedly, "I don't know what is going to happen now."

"What do you mean?"

"Well... if I was captain, I'd lay over and send for a relief. But I don't know."

For the first time Max realized that this change would make Mr. Simes the astrogator. "How long would it take to get a relief?"

"Figure it out. The *Dragon* is about three months behind us; she'd pick up our mail. A year about." In the contradictions of interstellar travel the ships themselves were the fastest method of communication; a radio message (had such a silly thing been attempted) would have taken more than two centuries to reach Earth, a like time for a reply.

Max found the Captain's cabin open and crowded with officers, all standing around, saying nothing, and looking solemn; he slipped inside without announcing himself and tried to be inconspicuous. Kelly did not go in. Captain Blaine sat at his desk with head bent. Several stragglers, members of the gay party at the Josephine, arrived after Max; First Officer Walther checked them off with his eyes, then said quietly to Blaine, "Ship's officers all present, sir."

Captain Blaine raised his head and Max was shocked to see how old he looked. "Gentlemen," he said in a low voice, "you know the sad news. Dr. Hendrix was found dead in his room this evening. Heart attack. The Surgeon tells me that he passed on about two hours before he was found—and that his death was probably almost painless."

His voice broke, then he continued. "Brother Hendrix will be placed in his last orbit two hours after we raise ship tomorrow. That is how he would have wished it, the Galaxy was his home. He gave unstintingly of himself that men should ride safely among the stars."

He paused so long that Max thought that the old man had forgotten that others were present. But when he resumed his voice was almost brisk. "That is all, gentlemen. Astrogators will please remain."

Max was not sure that he counted as an astrogator but the use of the plural decided him. First Officer Walther started to leave; Blaine called him back. When the four were alone, the Captain said, "Mr. Simes, you will take over head-of-department duties at once. Mr., uh… "; his eyes rested on Max.

"Jones, sir."

"Mr. Jones will assume your routine duties, of course. This tragedy leaves you shorthanded; for the rest of this trip I will stand a regular watch."

Simes spoke up. "That isn't necessary, Captain. We'll make out."

"Perhaps. But those are my wishes."

"Aye aye, sir."

"Prepare to lift on schedule. Any questions?"

"No, sir."

"Goodnight, gentlemen. Dutch, stay a moment, please?"

Outside the door Simes started to turn away; Max stopped him. "Mr. Simes?"

"Huh? Yes?"

"Any instructions for me, sir?"

Simes looked him over. "You stand your watch, Mister. I'll handle everything else."

The next morning Max found a crepe armband on his desk and a notice from the First Officer that mourning would continue for one week. The *Asgard* raised on schedule, with the Captain sitting quietly in his chair, with Simes at the control console. Max stood near the Captain, with nothing to do. Aside from the absence of Hendrix all was routine—except that Kelly was quite bad-tempered. Simes, Max admitted, handled the maneuver smartly—but it was precomputed, anyone could have done it; shucks, Ellie could have been sitting there. Or Chipsie.

Max had the first watch. Simes left him after enjoining him not to deviate from schedule without phoning him first. An hour later Kovak relieved Max temporarily and Max hurried to the passenger lock. There were five honorary pall bearers, the Captain, Mr. Walther, Simes, Max, and Kelly. Behind them, crowding the passageways, were officers and most of the crew. Max saw no passengers.

The inner door of the lock was opened; two steward's mates carried the body in and placed it against the outer door. Max was relieved to see that it had been wrapped in a shroud covering it completely. They closed the inner door and withdrew.

The Captain stood facing the door, with Simes and the First Officer standing guard on one side of the door and, on the other side facing them, Max and Kelly. The Captain flung one word over his shoulder: "Pressure!"

Behind stood Bennett wearing a portable phone; he relayed the word to the power room. The pressure gauge over the lock door showed one atmosphere; now it started to crawl upward. The Captain took a little book from his pocket and began to read the service for the dead. Feeling that he could not stand to listen Max watched the pressure gauge. Steadily it climbed. Max reflected that the ship had already passed escape speed for the Nu Pegasi system before he had been relieved; the body would take an open orbit.

The gauge reached ten atmospheres; Captain Blaine closed his book. "Warn the passengers," he said to Bennett.

Shortly the loudspeakers sounded: "All hands! All passengers! The ship will be in free fall for thirty seconds. Anchor yourselves and do not change position." Max reached behind him, found one of the many hand holds always present around an airlock and pulled down so that his grip would keep his feet in contact with the deck. A warning siren howled—then suddenly he was weightless as the ship's boost and the artificial anomalous gravity field were both cut out.

He heard the Captain say loudly and firmly, "'Ashes to ashes, dust to dust.' Let the body be cast forth."

The pressure gauge dropped suddenly to zero and Dr. Hendrix was launched into space, there to roam the stars for all eternity.

Max felt weight again as the power room brought them back to ship-normal. The pressure gauge showed gradually building pressure. People turned away and left, their voices murmuring low. Max went up and relieved the watch.

The following morning Simes moved into Dr. Hendrix's cabin. There was trouble with First Officer Walther about it—Max heard only third-hand reports—but the Captain upheld Simes; he stayed in the Astrogator's quarters. The Worry Hole settled into routine not much different from what had gone before, except that Simes' personality spread through everything. There had never been a posted watch list before; Kelly had always assigned the crewmen and the Doctor had simply informed the topwatch standers orally of his wishes. Now a typed list appeared:

FIRST WATCH Randolph Simes, Astrogator
SECOND WATCH Captain Blaine
(M. Jones, acting apprentice, under instruction)
THIRD WATCH Kelly, Ch. Cmptrmn.
(*signed*) Randolph Simes, Astrogator

Below was a four-watch list for crewmen, also signed by Simes.

Max looked at it and shrugged it off. It was obvious that Simes had it in for him, though he could not figure out why. It was equally obvious that Simes did not intend to let him do any astrogation and that Max's chances of being accepted in time as a fullfledged brother had now, with the death of Dr. Hendrix, sunk to zero. Unless, of course, Captain Blaine overrode Simes and forced a favorable report, which was extremely unlikely. Max again began to think of going along with Sam at Nova Terra.

Well, in the meantime he'd stand his watches and try to stay out of trouble. That was that.

There was only one transition to be made between Halcyon and Nova Terra, a leap of ninety-seven lightyears three weeks out from Halcyon at a boost of seventeen gravities—the boost always depended on the distance from the star to the gateway, since the purpose was to arrive there just under the speed of light. The Worry Hole stayed on a watch in three for the officers and one in four for crewmen for the first two weeks. Captain Blaine showed up each watch but seemed quite willing for Max to carry out the light duties of that portion of the leg. He gave little instruction—when he did, he was likely to wander off into anecdotes, amusing but not useful.

Max tried to continue his own drill, carrying out the routine middle o' watch computation as if it were the frantic matter it would have been near transition. Captain Blaine watched him, then said mildly, "Don't get yourself into a state, son. Always program on paper when possible—always. And take time to check. Hurrying causes mistakes." Max said nothing, thinking of Dr. Hendrix, but carried out the orders.

At the end of his first watch under the Captain Max signed the log as usual. When Simes came on watch four hours later, Max was dug out of bed and required to report to the control room. Simes pointed to the log. "What's the idea, Mister?"

"Of what, sir?"

"Signing the log. You weren't officer of the watch."

"Well, sir, the Captain seemed to expect it. I've signed a lot of logs and he's always approved them in the past."

"Hmm—I'll speak to the Captain. Go below."

At the end of his next watch, having received no instructions, Max prepared the log and took it to the Captain. "Sir? Do you want to sign this? Or shall I?"

"Eh?" Blaine looked at it. "Oh, I suppose I had better. Always let a head of department do things his own way if possible. Remember that when you are a skipper, son." He signed it.

That settled it until the Captain started a habit of not being there, first for short periods, then for longer. The time came when he was absent at the end of the watch; Max phoned Mr. Simes. "Sir, the Captain isn't here. What do you want me to do?"

"So what? It's his privilege to leave the control room."

"But Kelly is ready to relieve and the log isn't signed. Shall I sign it? Or shall I phone him?"

"Phone him? Jumping jeepers, no! Are you crazy?"

"What are your orders, sir?"

Simes was silent, then answered, "Print his name, then sign under it 'By direction'—and after this use your head."

They changed to watch-and-watch for the last week. Max continued under the Captain; Kelly assisted Simes. Once the shift was made Blaine became meticulous about being present in the control room and, when Max started to make the first computation, gently pushed him aside. "I had better take over, lad. We're getting closer now."

So Max assisted him—and became horrifyingly aware that the Captain was not the man he must once have been. His knowledge of theory was sound and he knew all the short cuts—but his mind tended to wander. Twice in one computation Max had to remind him diplomatically of details. Yet the Old Man seemed unaware of it, was quite cheerful.

It went on that way. Max began to pray that the Captain would let the new Astrogator make the transition himself—much as he despised Simes. He wanted to discuss his misgivings with Kelly—there was no one else with whom it would have been possible—but Kelly was on the opposite watch with Simes. There was nothing to do but worry.

When the last day arrived he discovered that Captain Blaine neither intended to take the ship through himself nor to let Simes do it; he had a system of his own. When they were all in the Worry Hole the Captain said, "I want to show you all a wrinkle that takes the strain out of astrogating. With no reflections on our dear brother, Dr. Hendrix, while he was a great astrogator, none better—nevertheless he worked too hard. Now here is a method taught me by my own master. Kelly, if you will have the remote controls led out, please."

He had them seat themselves in a half circle, himself, Simes, and Max, around the saddle of the computer, with Kelly in the saddle. Each of them was armed with programming forms and Captain Blaine held the remote-control switches in his lap. "Now the idea is for us each to work a sight in succession, first me, then Mr. Simes, then Mr. Jones. That way we keep the data flowing without strain. All right, lads, start pitching. Transition stations everyone."

They made a dry run, then the Captain stood up. "Call me, Mr. Simes, two hours before transition. I believe you and Mr. Jones will find that this method gives you enough rest in the meantime."

"Yes, sir. But Captain—may I make a suggestion?"

"Eh? Certainly, sir."

"This is a fine system, but I suggest that Kelly be put in the astrogating group instead of Jones. Jones is not experienced. We can put Kovak in the saddle and Lundy on the book."

Blaine shook his head. "No. Accuracy is everything, sir, so we must have our best operator at the computer. As for Mr. Jones, this is how he must get experience—if he gets rattled, you and I can always fill in for him." He started to leave, then added, "But Kovak can alternate with Kelly until I return. Mustn't have anyone getting tired, that way mistakes are made."

"Aye aye, sir."

Simes said nothing more to Max. They started working sights, alternately, using written programming on printed forms. The sights were coming in on a twenty-minute schedule, giving each of them forty minutes for a problem if he cared to take it. Max began to think that the Captain's method did have its points. Certainly Dr. Hendrix had worked himself to death—ships did not wear out but men did.

He had plenty of time to work not only his own problems, but those of Simes. The data came out orally and there was nothing to keep Max from programming Simes' sights in his head and checking on what went into the computer. So far as he could see Simes was doing all right—though of course there was no real strain involved, not yet.

They ate sandwiches and drank coffee where they sat, leaving their seats only for five minutes or so at a time. Captain Blaine showed up twenty minutes early. He smiled and said cheerily, "Everyone happy and relaxed? Now we really get down to it. I have just time for a cup of coffee."

A few minutes later he sat down and took over the control switches from Simes. The sights were coming through on a ten-minute schedule now, still ample time. Max continued to work them all, his own on paper and the others in his head. He was always through in time to catch the data for the next sight, program it mentally and check translations as Lundy thumbed the book. It gave him a running picture of how closely they were in the groove, how much hunting they were having to do in approaching their invisible target. It seemed to him that Simes tended to over-correct and that the Captain was somewhat optimistically under-correcting, but neither was so far out as to endanger the ship.

Maybe he was wrong about the Captain—the Old Man seemed to steady down when it mattered. His own corrections, he was glad to see, the Captain applied without question.

After more than an hour with transition fortyfive. minutes away Captain Blaine looked up and said, "All right, boys, we're getting close. Slam them to us as fast as you can now."

Smythe and Kovak, with Noguchi and Bennett running for them, slipped into high gear; data poured out in a steady stream. Max continued to work every sight, programming his own in his head and calling off figures faster than he wrote them down. He noticed that Simes was sweating, sometimes erasing and starting over. But the figures Simes called out agreed with what Max thought they should be, from his own mental programming. Captain Blaine seemed relaxed, though he had not speeded up materially and sometimes was still using the computer when Max was ready to pour his sight into it.

At one point Simes spoke too rapidly, slurring his figures, Lundy promptly said, "Repeat, sir!"

"Confound it! Clean out your ears!" But Simes repeated. The Captain glanced up, then bent back to his own problem. As soon as the computer was free Captain Blaine called his own figures to Lundy. Max had already set up the Captain's sight in his mind, was subconsciously listening while watching Simes.

An alarm bell rang in his mind. "Captain! I don't check you!"

Captain Blaine stopped. "Eh?"

"That program is wrong, sir."

The Captain did not seem angry. He simply handed his programming board to Simes. "Check me, sir."

Simes glanced quickly at the figures. "I check you, sir!"

Blaine said, "Drop out, Jones. Mr. Simes and I will finish."

"But—"

"Drop out, Mister!"

Max got out of the circle, seething inside. Simes' check of the Captain's set up hadn't meant anything, unless Simes had listened to and remembered (as Max had) the data as it came in. The Captain had transposed an eight and a three in the fifth and sixth decimal places—the set up would look okay unless one knew the correct figures. If Simes had even bothered to check it, he added bitterly.

But Max could not keep from noting and processing the data in his mind. Simes' next sight should catch the Captain's error; his correction should repair it. It would be a big correction, Max knew; traveling just under the speed of light the ship clipped a million miles in less than six seconds.

Max could see Simes hesitate as the lights from his next sight popped up on the computer and Lundy translated them back. Why, the man looked frightened! The correction called for would push the ship extremely close to critical speed—Simes paused, then ordered less than half the amount that Max believed was needed.

Blaine applied it and went on with his next problem. When the answer came out the error, multiplied by time and unthinkable velocity, was more glaring than ever. The Captain threw Simes a glance of astonishment, then promptly made a correction. Max could not tell what it was, since it was done without words by means of the switch in his lap.

Simes licked the dryness from his lips. "Captain?"

"Time for just one more sight," Blaine answered. "I'll take it myself, Mr. Simes."

The data were passed to him, he started to lay his problem out on the form. Max saw him erase, then look up; Max followed his gaze. The pre-set on the chronometer above the computer showed the seconds trickling away. "Stand by!" Blaine announced.

Max looked up. The stars were doing the crawling together that marked the last moments before transition. Captain Blaine must have pressed the second switch, the one that would kick them over, while Max was watching, for the stars suddenly blinked out and were replaced instantaneously by another starry firmament, normal in appearance.

The Captain lounged back, looked up. "Well," he said happily, "I see we made it again." He got up and headed for the hatch, saying over his shoulder, "Call me when you have laid us in the groove, Mr. Simes." He disappeared down the hatch.

Max looked up again, trying to recall from the charts he had studied just what piece of this new sky they were facing. Kelly was looking up, too. "Yes, we came through," Max heard him mutter. "But *where?*"

Simes also had been looking at the sky. Now he swung around angrily. "What do you mean?"

"What I said," Kelly insisted. "That's not any sky I ever saw before."

"Nonsense, man! You just haven't oriented yourself. Everybody knows that a piece of sky can look strange when you first glance at it. Get out the flat charts for this area; we'll find our landmarks quickly enough."

"They are out, sir. Noguchi."

It took only minutes to convince everyone else in the control room that Kelly was right, only a little longer to convince even Simes. He finally looked up from the charts with a face greenish white. "Not a word to anybody," he said. "That's an order—and I'll bust any man who slips. Kelly, take the watch."

"Aye aye, sir."

"I'll be in the Captain's cabin." He went below to tell Blaine that the *Asgard* had come out in unknown space—was lost.

14 — ANYWHERE

Two hours later Max climbed wearily up into the Worry Hole. He had just had a bad half hour, telling the truth as he saw it. Captain Blaine had been disinclined to blame anyone but himself, but had seemed stunned and bewildered. Simes had been nasty. His unstated logic seemed to be that, since it could not possibly be his fault and since it was unthinkable to blame the Captain, it must be Max's fault. Since Max had been relieved some minutes before transition, his theory seemed to be that Max had caused it by making a disturbance as they were approaching the critical instant—joggled their elbows, so to speak.

Mr. Walther had been present, a mute judge. They spoke of matters' outside his profession; he had seemed to be studying their faces. Max had stuck doggedly to his story.

He found Kelly still on watch. Kovak and Smythe were taking spectrograms; Noguchi and Lundy were busy with papers. "Want to be relieved?" he said to Kelly.

Kelly looked troubled. "I'm sorry, but you can't."

"Huh?"

"Mr. Simes phoned while you were on your way up. He says you are not to stand duty until further notice."

"He did? Well, I'm not surprised."

"He also said that you were to stay out of the control room."

Max made a violent statement about Simes. He added, "Well, it was nice while it lasted. Be seeing you."

He turned away but Kelly stopped him. "Don't be in a hurry, Max. He won't be up for a while. I want to know what happened. From the computer I can't tell what goes on."

Max told him, drawing on his memory for the figures. Kelly nodded at last. "That confirms what I've been able to dig out. The Captain flubbed with a transposition—easy to do. Then Simes didn't have the guts to make a big correction when it came around to him. But one more thing you don't know. Neither do they—yet."

"Huh? What?"

"The power room recorder shows it. Guenther had the watch down there and gave it to me over the phone. No, I didn't tell him anything was wrong. I just asked for the record; that's not unusual. By the way, any excitement down below? Passengers blowing their tops?"

"Not when I came up."

"Won't be long. They can't keep this quiet forever. Back to my story—things were already sour but the Captain had one last chance. He applied the correction and a whopping big one. But he applied it with the wrong sign, just backwards."

Profanity was too weak. All Max could say was, "Oh, my!"

"Yeah. Well, there's the devil to pay and him out to lunch."

"Any idea where we are?"

Kelly pointed to Kovak and Smythe at the spectrostellograph. "They're fishing, but no bites. Bright stars first, B-types and O's. But there is nothing that matches the catalogues so far."

Noguchi and Lundy were using a hand camera. Max asked, "What are *they* doing?"

"Photographing the records. All of 'em—programming sheets, the rough data from the chartsmen, the computer tape, everything."

"What good will that do?"

"Maybe none. But sometimes records get lost. Sometimes they even get changed. But not this time. I'm going to have a set of my own."

The unpleasant implications of Kelly's comments were sinking into Max's mind when Noguchi looked up. "That's all, Boss."

"Good." Kelly turned to Max. "Do me a favor. Stick those films in your pocket and take them with you. I want them out of here. I'll pick them up later."

"Well… all right." While Noguchi was unloading the camera Max added to Kelly, "How long do you think it will take to figure out where we are, checking spectra?"

Kelly looked more troubled than ever. "Max, what makes you think there is anything to find?"

"I don't follow you."

"Why should anything out there… " He made a sweeping gesture. "… match up with any charts we've got here?"

"You mean," Max said slowly, "that we might not be in our own galaxy at all? Maybe in another, like the Andromeda Nebula, say?"

"Maybe. But that's not all. Look, Max, I'm no theoretical physicist, that's sure, but so far as I know all that theory says is that when you pass the speed of light you have to go out of your own space, somewhere else. You've become irrelevant and it won't hold you. But *where* you go, unless you are set just right for a Horst congruency, that's another matter. The theory doesn't say. Does it?"

Max's head started to ache. "Gee, I don't know."

"Neither do I. But since we weren't set to duck back into our own space at another point, we may be anywhere. And I mean *anywhere*. We may be in some other spacetime totally unconnected with our own." He glanced up at the strange stars.

Max went below feeling worse than ever. He passed Simes going up; the Astrogator scowled at him but did not say anything. When Max reached his stateroom he put the films in a drawer—then thought about it, removed the drawer and cached them in dead space behind the drawer.

Max stayed in his room and worried. He fretted over being kept out of the control room, wanting very badly himself to check the sky for known stars. B-and O-type stars—well, that was all right, but there were half a dozen other ways. Globular star clusters, now—they'd be easy to identify; snag four of them and you'd know where you were as clear as reading a street sign. Then it would be just a case of fining it down, because you'd know what to look for and where. After which you'd hightail it for the nearest charted congruency, whether it took you a week or a year. The ship couldn't *really* be lost.

But suppose they weren't even in the right galaxy?

The thought dismayed him. If that were the case, they'd never get home before the end of time. It was chased out by another thought—suppose Kelly's suspicion had been correct, that this was an entirely different universe, another system of space and time? What then? He had read enough philosophical fancies to know that there was no theoretical reason for such to be impossible; the Designer might have created an infinity of universes, perhaps all pretty much alike—or perhaps as different as cheese and Wednesday. Millions, billions of them, all side by side from a multidimensional point of view.

Another universe might have different laws, a different speed of light, different gravitational ballistics, a different time rate—why they might get back to find that ten million years had passed and Earth burnt to a cinder!

But the light over his desk burned steadily, his heart pumped as always, obeying familiar laws of hydraulics, his chair pressed up against him—if this was a different sort of space the differences weren't obvious. And if it *was* a different universe, there was nothing to be done about it.

A knock came at the door, he let Kelly in and gave him the chair, himself sitting on the bed. "Any news?"

"No. Golly I'm tired. Got those pix?"

Max took out the drawer, fished around behind it, gave them to Kelly. "Look, Chief, I got an idea."

"Spill it."

"Let's assume that we're in the right galaxy, because—"

"Because if we ain't, there isn't any point in trying!"

"Well, yes. All right, we're in the Milky Way. So we look around, make quick sample star counts and estimate the distance and direction of the center. Then we try to identify spectra of stars in that direction, after deciding what ones we ought to look for and figuring apparent magnitudes for estimated distance. That would…"

"—save a lot of time," Kelly finished wearily. "Don't teach your grandpop how to suck eggs. What the deuce do you think I've been doing?"

"Oh. Sorry."

"Don't be. It's more than our revered boss thought of. While I been trying to work he's been bellyachin' around, finding fault, and trying to get me to say that he was dead right in everything—worrying about himself instead of worrying about his ship. Pfui! By the way, he grabbed the records just like I thought he would—'to show the Captain.' *He* says." Kelly stood up. "I'd better go."

"Don't rush. I'll ring for coffee."

"Running out of my ears now." Kelly took the films from his pocket and looked at them dutifully. "I had Noggy make two shots of everything; this is a double set. That's a good hidey-hole you've got. What say we stick one set in there and let it cool? Never can tell."

"Kelly, you aren't really expecting trouble over those records? Seems to me we've got trouble enough with the ship being lost."

"Huh? Max, you're going to make a good officer some day. But you're innocent. Now I'm a suspenders *and* belt man. I like to take as few chances as possible. Doc Hendrix—rest his soul!—was the same way." Kelly waited until Max had returned the spare set to the space back of the drawer, then started to leave. He paused.

"One thing I forgot to tell you, Max. We happened to come out pretty close to a star and a G-type at that."

"Oh." Max considered it. "Not one we know?"

"Of course not, or I would have said so. Haven't sized it yet, but figuring normal range in the G's we could reach it in not less than four weeks, not more than a year, at high boost. Thought you'd like to know."

"Well, yes. Thanks. But I can't see that it makes much difference."

"No? Doesn't it seem like a good idea to have a Sol-type star, with maybe Earth-type planets around it, not far off?"

"Well..."

"It does to me. The Adam-and-Eve business is rugged at best—and we might be in for a long stay." With that he left.

No steward's mate came to tell Max it was time for dinner; when he noticed that it was past time, he went to the lounge. Most of the passengers were already seated, although some were standing around talking. It was impossible to miss the feeling of unrest in the room. Max saw that the Captain was not at his table, nor was Mr. Walther at his. As he headed for his own table a Mr. Hornsby tried to grab his arm. Max shook him off. "Sorry, sir. I'm in a hurry."

"Wait a minute! I want to ask you..."

"Sorry." He hurried on and sat down. Chief Engineer Compagnon was not at the table, but the usual passengers were present. Max said, "Good evening," and reached for his soup spoon, just to keep busy.

There was no soup to be toyed with, nor were there rolls and butter on the table, although it was ten minutes past the hour. Such things simply did not happen in Chief Steward Dumont's jurisdiction. Come to think about it, Dumont was not in sight.

Mrs. Daigler put a hand on his arm. "Max? Tell me, dear—what is this silly rumor going around?"

Max tried to maintain a poker face. "What rumor, ma'am?"

"You must have heard it! After all, you're in astrogation. They say that the Captain turned the wrong corner or something and that we're falling into a star."

Max tried to give a convincing chuckle. "Who told you that? Whoever it was probably couldn't tell a star from his elbow."

"You wouldn't fool your Aunt Maggie?"

"I can assure you positively that the *Asgard* is not falling into a star. Not even a small star." He turned in his chair. "But it does look like something's fallen into the galley. Dinner is awfully late."

He remained turned, trying to avoid further questions. It did not work. Mr. Arthur called out sharply, "Mr. Jones!"

He turned back. "Yes?"

"Why stall us? I have been informed authoritatively that the ship is lost."

Max tried to look puzzled. "I don't follow you. We seem to be in it."

Mr. Arthur snorted. "You know what I mean! Something went wrong with that whatyoumucallit—transition. We're lost."

Max put on a school-teacherish manner, ticking off points on his fingers. "Mr. Arthur, I assure you that the ship is in absolutely no danger. As for being lost, I assure you just as firmly that if we are, the Captain neglected to tell me so. I was in the control room at transition and he seemed quite satisfied with it. Would you mind telling me who has been spreading this story? It's a serious thing, starting such rumors. People have been known to panic."

"Well… it was one of the crew. I don't know his name."

Max nodded. "I thought so. Now in my experience in space… " He went on, quoting from his uncle. "… I have learned that the only thing faster than light is the speed with which a story can spread through a ship. It doesn't have to have any foundation, it spreads just the same." He looked around again. "I wonder what has happened to dinner? I'd hate to go on watch hungry."

Mrs. Weberbauer said nervously, "Then we are all right, Maxie?"

"We're all right, ma'am."

Mrs. Daigler leaned toward him again and whispered, "Then why are you sweating, Max?"

He was saved by a steward's mate rushing up to the table and starting to deal out plates of soup. Max stopped him when he came around and said quietly, "Jim, where's Dumont?"

Out of the corner of his mouth the waiter said, "Cooking."

"Huh? Where's the chef?"

The steward's mate leaned down and whispered, "Frenchy is boiled as a judge. I guess he couldn't take it. You know."

Max let him go. Mr. Arthur said sharply, "What did he tell you?"

"I was trying to find out what went wrong in the galley," Max answered. "Seems the cook incapacitated himself." He spooned up a mouthful of the soup. "From the taste I'd say he had burned his thumb in this so-called chowder. Pretty bad, isn't it?"

Max was saved from further evasions by the arrival of the First Officer. Mr. Walther went to the Captain's table and banged on a glass with a spoon. "Your attention, please!"

He waited for quiet, then took a paper from his pocket. "I have an announcement to make on behalf of the Captain. Those of you who are familiar with the theory of astrogation are aware that space is changing constantly, due to the motions of the stars, and that consequently no two trips are exactly alike. Sometimes it is necessary, for this reason, to make certain changes in a ship's routing. Such a circumstance has arisen in this present trip and the *Asgard* will be somewhat delayed in reaching her next destination. We regret this, but we can't change the laws of nature. We hope that you will treat it as a minor inconvenience—or even as additional vacation, in the friendly and comfortable atmosphere of our ship. Please remember, too, that the insurance policy accompanying your ticket covers you completely against loss or damage you may be cost through the ship being behind schedule."

He put away the paper; Max had the impression that he had not actually been reading from it. "That is all that the Captain had to say, but I want to add something myself. It has come to my attention that someone has been spreading silly rumors about this minor change in schedule. I am sorry if any of you have been alarmed thereby and I assure you that I will take very strict measures if the originator can be identified." He risked a dignified smile. "But you know how difficult it is to trace down a bit of gossip. In any case, I want to assure you all that the *Asgard* is in no danger of any sort. The old girl was plying space long before any of us were born, she'll still be going strong after we all die of old age—bless her sturdy bones!" He turned and left at once.

Max had listened in open-mouthed admiration. He came from country where the "whopper" was a respected literary art and it seemed to him that he had never heard a lie told with more grace, never seen one interwoven with truth with such skill, in his life. Piece by piece, it was impossible to say that anything the First Officer had said was untrue; taken as a whole it was a flat statement that the *Asgard* was not lost—a lie if he ever heard one. He turned back toward his table mates. "Will someone pass the butter, please?"

Mr. Arthur caught his eye. "And you told us," he said sharply, "that nothing was wrong!"

Mr. Daigler growled, "Lay off him, Arthur. Max did pretty well, under the circumstances."

Mrs. Weberbauer looked bewildered. "But Mr. Walther said that everything was all right?"

Daigler looked at her with compassion. "We're in trouble, Mama Weberbauer. That's obvious. But all we can do is keep calm and trust the ship's officers. Right, Max?"

"I guess that's right, sir."

15 — "THIS ISN'T A PICNIC"

Max kept to his room that evening and the next day, wishing neither to be questioned by passengers nor to answer questions about why he had been relieved of duty. In consequence he missed the riot, having slept through it. He first heard of it when the steward's mate who tended his room showed up with a black eye. "Who gave you the shiner, Garcia?"

"I'm not sure, sir. It happened in the ruckus last night."

"Ruckus? What ruckus?"

"You mean you don't know?"

"This is the first I've heard of it. What happened?"

Garcia Lopez stared at the overhead. "Well—I wouldn't want to say too much. You know how it is—nobody wants to testify against a mate. No?"

"Who asked you to peach on a mate? You don't have to mention names—but what happened?"

"Well, sir. Some of those chicos, they ain't got much sense." Slowly Max learned that the unrest among the crew had been greater than that among the passengers, possibly because they understand more clearly the predicament. Some of them had consulted with Giordano's poor-man's vodka, then had decided to call on the Captain in a body and demand straight talk. The violence had taken place when the master-at-arms had attempted to turn them back at the companionway to "C" deck.

"Anybody hurt?"

"Not what you'd call hurt. Cut up a little. I picked this up… " He touched his eye tenderly. "… from being too anxious to see what was going on. Slats Kovak busted an ankle."

"Kovak! Why would *he* be in it?" It did not make sense that a member of the Worry gang should take part in anything so unreasonable.

"He was coming down, coming off watch, I guess. Maybe he was backing up the constable. Or maybe he just got caught in the swinging doors. Your friend Sam Anderson was sure in the thick of it."

Sam! Max felt sick at heart—Sam in trouble *again!* "You're sure?"

"I was there."

"Uh, he wasn't leading it, was he?"

"Oh, you got me wrong, M—Mr. Jones. He settled it. I never see a man who could use his hands like that. He'd grab two of 'em… *clop!* their heads would come together. Then he would grab two more."

Max decided to come out of hiding and do two things; look up Kovak, find out how he was and what he might need or want, and second, look up Sam. But before he could leave Smythe arrived with a watch list to initial. He found that he was assigned watch-and-watch with Simes—and that he himself was due on watch immediately. He went up, wondering what had caused Simes to relent.

Kelly was in the control room; Max looked around, did not see Simes. "You got it, Chief?"

"Until you relieve me. This is my last watch."

"How's that? Are you his pet peeve now?"

"You could say so. But not the way you think, Max. He drew up a watch list with him and me heel-and-toe. I politely pointed out the guild rules, that I wasn't being paid to take the responsibility of top watch."

"Oh, brother! What did he say?"

"What could he say? He could order me in writing and I could accept in writing, with my objection to the orders entered in the log—and his neck is out a yard. Which left him his choice of putting you back on the list, asking the Captain to split it with him, or turning his cap around and relieving himself for the next few weeks. With Kovak laid up it didn't leave him much choice. You heard about Kovak?"

"Yes. Say, what was that?" Max glanced over where Noguchi was loafing at the computer and lowered his voice. "Mutiny?"

Kelly's eyes grew round. "Why, as I understand it, sir, Kovak slipped and fell down a companionway."

"Oh. Like that, huh?"

"That's what it says in the log."

"Hmm… well, I guess I had better relieve you. What's the dope?"

They were in orbit under power for the nearby G-type star; the orders were entered in the Captain's order book… in Simes' handwriting but with Captain Blaine's signature underneath. To Max it looked shaky, as if the Old Man had signed it under emotional stress. Kelly had already placed them in the groove. "Have we given up trying to find out where we are?" Max asked.

"Oh, no. Orders are to spend as much time as routine permits on it. But I'll lay you seven to two you don't find anything. Max, this is somewhere else entirely."

"Don't give up. How do you know?"

"I feel it."

Nevertheless Max spent the watch "fishing." But with no luck. Spectrograms, properly taken and measured, are to stars what fingerprints are to men; they can be classified and comparisons made with those on file which are most nearly similar. While he found many which matched fairly closely with catalogued spectra, there was always the difference that makes one identical twin not quite like his brother.

Fifteen minutes before the end of the watch he stopped, and made sure that he was ready to be relieved. While waiting he thought about the shenanigan Kelly had pulled to get him back on duty. Good old Kelly! He knew Kelly well enough to know that he must not thank him; to do so would be to attribute to the Chief Computerman a motive which was "improper"—just wink the other eye and remember it.

Simes stomped in five minutes past the hour. He said nothing but looked over the log and records of observations Max had made. Max waited several minutes while growing more and more annoyed. At last he said, "Are you ready to relieve me, sir?"

"All in good time. I want to see first what you've loused up this time." Max kept his mouth shut. Simes pointed at the log where Max had signed it followed by "C.O. o/W." "That's wrong, to start with. Add 'under instruction.'"

Max breathed deeply. "Whose instruction, sir?"

"Mine."

Max hesitated only momentarily before answering, "No, sir. Not unless you are present during my watch to supervise me."

"Are you defying me?"

"No, sir. But I'll take written orders on that point… entered in the log."

Simes closed the log book and looked him slowly up and down. "Mister, if we weren't shorthanded you wouldn't be on watch. You aren't ready for a top watch—and it's my opinion that you won't ever be."

"If that's the way you feel, sir, I'd just as lief go back to chartsman. Or steward's mate."

"That's where you belong!" Simes' voice was almost a scream.

Noguchi had hung around after Lundy had relieved him; they both looked up, then turned their heads away.

Max made no effort to keep his answer private. "Very good, sir. Will you relieve me? I'll go tell the First Officer that I am surrendering my temporary appointment and reverting to my permanent billet."

Max expected a blast. But Simes made a visible effort to control himself and said almost quietly, "See here, Jones, you don't have the right attitude."

Max thought to himself, "What have I got to lose?" Aloud he said, "You're the one who doesn't have the right attitude, sir."

"Eh? What's that?"

"You've been riding me ever since I came to work in the Hole. You've never bothered to give me any instruction and you've found fault with everything I did. Since my probationary appointment it's been four times worse. You came to my room and told me that you were opposed to my appointment, that you didn't want me…"

"You can't prove that!"

"I don't have to. Now you tell me that I'm not fit to stand the watch you've just required me to stand. You've made it plain that you will never recommend me for permanent appointment, so obviously I'm wasting my time. I'll go back to the Purser's gang and do what I can there. Now, will you relieve me, sir?"

"You're insubordinate."

"No, sir, I am not. I have spoken respectfully, stating facts. I have requested that I be relieved—my watch was over a good half hour ago—in order that I may see the First Officer and revert to my permanent billet. As allowed by the rules of both guilds," Max added.

"I won't let you."

"It's my option, sir. You have no choice."

Simes' face showed that he indeed had no choice. He remained silent for some time, then said more quietly, "Forget it. You're relieved. Be back up here at eight o'clock."

"Not so fast, sir. You have stated publicly that I am not competent to take the watch. Therefore I can't accept the responsibility."

"Confound it! What are you trying to do? Blackmail me?

Max agreed in his mind that such was about it, but he answered, "I wouldn't say so, sir. You can't have it both ways."

"Well—I suppose you are competent to stand this sort of watch. There isn't anything to do, actually."

"Very good, sir. Will you kindly log the fact?"

"Huh?"

"In view of the circumstances, sir, I insist on the letter of the rules and ask you to log it."

Simes swore under his breath, then grabbed the stylus and wrote quickly. He swung the log book around. There!"

Max read: "M. Jones is considered qualified to stand a top watch in space, not involving anomaly. (s) R. Simes, Astrogator."

Max noted the reservation, the exception that would allow Simes to keep him from ever reaching permanent status. But Simes had stayed within the law. Besides, he admitted to himself, he didn't want to leave the Worry gang. He comforted himself with the thought that since they were all lost together it might never matter what Simes recommended.

"Quite satisfactory, sir."

Simes grabbed the book. "Now get out. See that you're back here on time."

"Aye aye, sir." Max could not refrain from having the last word, standing up to Simes had gone to his head. "Which reminds me, sir: will you please relieve me on time after this?"

"*What*?"

"Under the law a man can't be worked more than four hours out of eight, except for a logged emergency."

"Go below!"

Max went below, feeling both exultant and sick. He had no taste for fights, never had; they left him with a twisted lump inside. He burst into his room, and almost fell over Sam.

"Sam!"

"The same. What's eating you, boy? You look like the goblins had been chasing you."

Max flopped on his bunk and sighed. "I feel that way, too." He told Sam about the row with Simes.

Sam nodded approval. "That's the way to deal with a jerk like that—insult him until he apologizes. Give him lumps enough times and he'll eat out of your hand."

Max shook his head dolefully. "Today was fun, but he'll find some way to take it out on me. Oh, well!"

"Not so, my lad. Keep your nose clean and wait for the breaks. If a man is stupid and bad-tempered—which he is, I sized him up long ago—if you are smart and keep *your* temper, eventually he leaves himself wide open. That's a law of nature."

"Maybe." Max swung around and sat up. "Sam—you're wearing your shield again."

Sam stuck his thumb under the badge of office of Chief Master-at-Arms. "Didn't you notice?"

"I guess I was spinning too fast. Tell me about it—did the First decide to forgive and forget?"

"Not precisely. You know about that little excitement last night?"

"Well, yes. But I understand that officially nothing happened?"

"Correct. Mr. Walther knows when to pull his punches."

"What did happen? I heard you cracked some skulls together."

"Nothing much. And not very hard. I've seen ships where it would have been regarded as healthy exercise to settle your dinner. Some of the lads got scared and that made them lap up happy water. Then a couple with big mouths and no forehead got the inspiration that it was their right to talk to the Captain about it. Being sheep, they had to go in a flock. If they had run into an officer, he could have sent them back to bed with no trouble. But my unfortunate predecessor happened to run into them and told them to disperse. Which they didn't. He's not the diplomatic type, I'm afraid. So he hollered, 'Hey, Rube!' in his quaint idiom and the fun began."

"But where do you figure? You came to help him?"

"Hardly. I was standing at a safe distance, enjoying the festivities, when I noticed Mr. Walther's bedroom slippers coming down the ladder. Whereupon I waded in and was prominent in the ending. The way to win a medal, Max, is to make sure the general is watching, then act."

Max grinned. "Somehow I hadn't figured you for the hero type."

"Heaven forbid! But it worked out. Mr. Walther sent for me, ate me out, told me that I was a scoundrel and a thief and a nogoodnick—then offered me my shield back if I could keep order below decks. I looked him in the eye, a sincere type look, and told him I would do my best. So here I am."

"I'm mighty pleased, Sam."

"Thanks. Then he looked me in the eye and told me that he had reason to suspect—as if he didn't know!—that there might be a still somewhere in the ship. He ordered me to find it, and then destroy any liquor I found."

"So? How did Mr. Gee take that?"

"Why, Fats and I disassembled his still and took the pieces back to stores, then we locked up his stock in trade. I pleaded with him not to touch it until the ship was out of its mess. I explained that I would break both his arms if he did."

Max chuckled. "Well, I'm glad you're back in good graces. And it was nice of you to come tell me about it." He yawned. "Sorry. I'm dead for sleep."

"I'll vamoose. But I didn't come to tell you, I came to ask a question."

"Huh? What?"

"Have you seen the Skipper lately?"

Max thought back. "Not since transition. Why?"

"Nor has anyone else. I thought he might be spending his time in the Worry Hole."

"No. Come to think, he hasn't been at his table either—at least when I've been in the lounge."

"He's been eating in his cabin." Sam stood up. "Very, very interesting. Mmm… I wouldn't talk about it, Max."

Simes was monosyllabic when Max relieved him. Thereafter they had no more words; Simes acted as if Max did not exist except for the brief formalities in relieving. The Captain did not show up in the control room. Several times Max was on the point of asking Kelly about it, but each time decided not to. But there were rumors around the ship—the Captain was sick, the Captain was in a coma, Walther and the Surgeon had relieved him of duty, the Captain was constantly at his desk, working out a new and remarkable way to get the ship back to where it belonged.

By now it was accepted that the ship was lost, but the time for hysteria had passed; passengers and crew were calm and there seemed to be general consent that the decision to put down around the solar-type star toward which they were headed was the only reasonable decision. They were close enough now that it had been determined that the star did have planets—no G-class star had ever been found to be without planets, but to pick them up on a stereoplate was consoling.

It came to a choice between planet #3 and planet #4. Bolometric readings showed the star to have a surface temperature slightly over 6000° Kelvin, consistent with its spectrum; it was not much larger than Father Sol; calculated surface temperatures for the third and fourth planets gave a probability that the third might be uncomfortably hot whereas number four might be frigid. Both had atmospheres.

A fast hyperboloid swing past both settled the matter. The bolometer showed number three to be too hot and even number four to be tropical. Number four had a moon which the third did not—another advantage for four, for it permitted, by examining the satellite's period, an easy calculation of its mass; from that and its visible diameter its surface gravity was a matter of substitution in classic Newtonian formula… ninety-three percent of Earth-normal, comfortable and rather low in view of its over ten-thousand-mile diameter. Absorption spectra showed oxygen and several inert gases.

Simes assisted by Kelly placed the *Asgard* in a pole-to-pole orbit to permit easy examination—Max, as usual, was left to chew his nails.

The Captain did not come to the control room even to watch this maneuver.

They hung in parking orbit while their possible future home was examined from the control room and stared at endlessly from the lounge. It was in the lounge that Ellie tracked Max down. He had hardly seen her during the approach, being too busy and too tired with a continuous heel-and-toe watch and in the second place with much on his mind that he did not want to have wormed out of him. But, once the orbit was established and power was off, under standard doctrine Simes could permit the watch to be taken by crewmen—which he did and again told Max to stay out of the control room.

Max could not resist the fascination of staring at the strange planet; he crowded into the lounge along with the rest. He was standing back and gazing over heads when he felt his arm grabbed. "Where have you been?"

"Working." He reached out and caressed Chipsie; the spider puppy leaped to his shoulders and started searching him.

"Hmmmph! You don't work all the time. Do you know that I sent *nine* notes to your room this past week?"

Max knew. He had saved them but had not answered. "Sorry."

"Sorry he says. Never mind—Max, tell me all about it." She turned and looked out. "What have they named it? Is there anybody on it? Where are we going to land? *When* are we going to land? Max, aren't you *excited?"*

"Whew! They haven't named it yet—we just call it'the planet' or 'number four.' Kelly wants to name it 'Hendrix.' Simes is hedging; I think he wants to name it after himself. The Captain hasn't made any decision that I know of."

"They ought to name it 'Truth' or 'Hope' or something like that. Where is the Captain, Max? I haven't seen the old dear for *days*."

"He's working. This is a busy time for him, of course." Max reflected that his evasion might be true. "About your other questions, we haven't seen any signs of cities or towns or anything that looks like civilization."

"What do you mean by 'civilization'? Not a lot of dirty old cities surely?"

Max scratched his head and grinned. "You've got me. But I don't see how you could have it, whatever it is, without cities."

"Why not? Bees have cities, ants have cities, challawabs have cities. None of them is civilized. I can think of a lovely civilization that would just sit around in trees and sing and think beautiful thoughts."

"Is that what you want?"

"No, it would bore me to death. But I can think about it, can't I? You didn't say when we were going to land?"

"I don't know. When they decide it's safe."

"I wish they would hurry. Isn't it thrilling? Just like Robinson Crusoe, or Swiss Family Robinson—I can't keep those two straight. Or the first men on Venus."

"They died."

"So they did. But we won't, not on—" She waved her hand at the lovely green and blue and cloudy-white globe. "—not on, uh, I'm going to call it 'Charity' because that's what it looks like."

Max said soberly, "Ellie, don't you realize this is serious?" He kept his voice low in order not to alarm others. "This isn't a picnic. If this place doesn't work out, it might be pretty awful."

"Why?"

"Look, don't quote me and don't talk about it. But I don't think any of us will ever get home again."

She sobered momentarily, then shrugged and smiled. "You can't frighten me. Sure, I'd like to go home—but if I can't, well, Charity is going to be good to us. I know it."

Max shut up.

16 — "—OVER A HUNDRED YEARS—"

The *Asgard* landed on Charity the following day. Eldreth affixed her choice by the statistical process of referring to the planet by that name, assuming that it was official, and repeating it frequently.

When word was passed that landing would commence at noon, ship's time, Max went to the control room and simply assumed that it was his right to be present. Simes looked at him sourly but said nothing—for an evident reason: Captain Blaine was present.

Max was shocked at his appearance. The Captain seemed to have aged ten to fifteen years since the bad transition. In place of his habitual cheerful expression was one that Max had trouble tagging—until he recalled that he had seen it on horses, on horses too old to work but still working—head bent, eyes dull, mute and resigned against a fate both inescapable and unbearable. The old man's skin hung loose, as if he had not eaten for days or weeks. He seemed hardly interested in what was going on around him.

He spoke only once during the maneuver. Just before the chronometer showed noon Simes straightened up from the console and looked at his skipper. Blaine lifted his head and said in a hoarse whisper, "Take her down, Mister."

An Imperial military ship in landing on a strange spot would normally guide a radar-beacon robot down first, then home in on the beacon. But the *Asgard* was a merchant liner; she expected to land nowhere but at ports equipped with beams and beacons and other aids. Consequently the landing was made blind by precomputed radar-automatic and was planned for an open valley selected by photograph. The planet was densely wooded in most areas, choice was limited.

Simes presented a picture of the alert pilot, hands poised at the controls, eyes on the radar screen portraying the view below them, while racked in front of him were comparison photographs, radar and visual. The let down was without incident; starry black sky gave way to deep purple, then to blue. There was not even a jar as the ship touched, for its private gravity inside its Horstian field kept them from feeling impressed acceleration. Max knew they were down when he saw Simes cut in the thrust beams to cradle the ship upright.

Simes said to the microphone, "Power room, start auxiliaries and secure. All hands, dirtside routine, first section." He turned to Blaine. "Grounded, Captain."

Blaine's lips shaped the words, "Very good, sir." He got up and shuffled toward the hatch. When he had gone Simes ordered, "Lundy, take standby watch. The rest of you clear the control room."

Max went down with Kelly. When they reached "A" deck Max said grudgingly, "It was a smart landing I'll have to admit."

"Thanks," said Kelly.

Max glanced at him. "So you calculated it?"

"I didn't say that. I just said, 'Thanks.'"

"So? Well, you're welcome." Max felt his weight pulse and suddenly he was a trifle lighter. "They cut the field. Now we're really down."

He was about to invite Kelly into his room for the inevitable coffee when the ship's speakers sounded: "All hands! All passengers! Report to Bifrost Lounge for an important announcement. Those on watch are ordered to listen in by phone."

"What's up?" asked Max.

"Why wonder? We'll go see."

The lounge was crowded with passengers and crew. First Officer Walther stood near the Captain's table, counting the crowd with his eyes. Max saw him speak to Bennett, who nodded and hurried away. The large view port was across the lounge from Max; he stretched on his toes and tried to see out. All he could see was hilltops and blue sky.

There was a lessening of the murmur of voices; Max looked around to see Bennett preceding Captain Blaine through the crowd. The Captain went to his table and sat down; the First Officer glanced at him, then cleared his throat loudly. "Quiet, please."

He went on, "I've called you together because Captain Blaine has something he wants to say to you." He stopped and stepped back respectfully.

Captain Blaine slowly stood up, looked uncertainly around. Max saw him square his thin shoulders and lift his head. "Men," he said, his voice suddenly firm and strong. "My guests and friends—" he went on, his voice sinking. There was a hush in the lounge, Max could hear the Captain's labored breathing. He again asserted control of himself and continued, "I have brought you… I have brought you as far as I can… " His voice trailed off. He looked at them for a long moment, his mouth trembling. It seemed impossible for him to continue. The crowd started to stir.

But he did continue and they immediately quieted. "I have something else to say," he began, then paused. This pause was longer, when he broke it his voice was a whisper. "I'm sorry. God keep you all." He turned and started for the door.

Bennett slipped quickly in front of him. Max could hear him saying quietly and firmly: "Gangway, please. Way for the Captain." No one said anything until he was gone, but a woman passenger at Max's elbow was sobbing softly.

Mr. Walther's sharp, clear voice rang out. "Don't go away, anyone! I have additional announcements to make." His manner ignored what they had all just seen. "The time has come to sum up our present situation. As you can see, this planet is much like our Mother Earth. Tests must be made to be sure that the atmosphere is breathable, and so forth; the Surgeon and the Chief Engineer are making them now. But it seems likely that this new planet will prove to be eminently suitable for human beings, probably even more friendly than Earth.

"So far, we have seen no indications of civilized life. On the whole, that seems a good thing. Now as to our resources—The *Asgard* carries a variety of domestic animals, they will be useful and should be conserved as breeding stock. We have an even wider variety of useful plants, both in the ship's hydroponic gardens and carried as seeds. We have a limited but adequate supply of tools. Most important of all the ship's library contains a fair cross-section of our culture. Equally important, we ourselves have our skills and traditions…"

"Mr. Walther!"

"Yes, Mr. Hornsby?"

"Are you trying to tell us that you are dumping us here?"

Walther looked at him coldly. "No. Nobody is being'dumped' as you put it. You can stay in the ship and you will be treated as a guest as long as the *Asgard*—or you yourself—is alive. Or until the ship reaches the destination on your ticket. If it does. No, I have been trying to discuss reasonably an open secret; this ship is lost."

A voiceless sigh went through the room. All of them knew it, but up till now it had not been admitted officially. The flat announcement from a responsible officer echoed like the sentence of a court.

"Let me state the legal position," Mr. Walther went on. "While this ship was in space you passengers were subject to the authority of the

Captain, as defined by law, and through him you were subject to me and the other ship's officers. Now we have landed. You may go freely… or you may stay. Legally this is an unscheduled stopover; if the ship ever leaves here you may return to it and continue as passengers. That is my responsibility to you and it will be carried out. But I tell you plainly that at present I have no hope to offer that we will ever leave here—which is why I spoke of colonizing. We are lost."

In the rear of the room a woman began to scream hysterically, with incoherent sounds of, "… home! I want to go home! Take me…"

Walther's voice cut through the hubbub. "Dumont! Flannigan! Remove her. Take her to the Surgeon."

He continued as if nothing had happened. "The ship and the ship's crew will give every assistance possible, consistent with my legal responsibility to keep the ship in commission, to aid any of you who wish to colonize. Personally I think…"

A surly voice cut in, "Why talk about 'law'? There is no law here!"

Walther did not even raise his voice. "But there is. As long as this ship is in commission, there is law, no matter how many lightyears she may be from her home port. Furthermore, while I have no authority over any who choose to leave the ship, I strongly advise you to make it your first act dirtside to hold a town meeting, elect officers, and found a constitutional government. I doubt that you can survive otherwise."

"Mr. Walther."

"Yes, Mr. Daigler?"

"This is obviously no time for recriminations…"

"Obviously!"

Daigler grinned wryly. "So I won't indulge, though I could think of some. But it happens that I know something professionally about the economics of colonizing."

"Good! We'll use your knowledge."

"Will you let me finish? A prime principle in maintaining a colony out of touch with its supply base is to make it large enough. It's a statistical matter, too small a colony can be overwhelmed by a minor setback. It's like going into a dice game with too little money: three bad rolls and you're sunk. Looking around me, it's evident that we have much less than optimal minimum. In fact—"

"It's what we have, Mr. Daigler."

"I see that. I'm not a wishful thinker. What I want to know is, can we count on the crew as well?"

Mr. Walther shook his head. "This ship will not be decommissioned as long as there are men capable of manning it. There is always hope, no matter how small, that we may find a way home. It is even possible that an Imperial survey ship might discover us. I'm sorry—no."

"That isn't quite what I asked. I was two jumps ahead of you, I figured you wouldn't let the crew colonize. But can we count on their help? We seem to have about six females, give or take one, who will probably help to carry on the race. That means that the next generation of our new nation is going to be much smaller. Such a colony would flicker and die, by statistical probability—unless every man jack of us works ten hours a day for the rest of his life, just to give our children a better chance of making it. That's all right with me, if we all make an all-out try. But it will take all the manpower we have to make sure that some young people who aren't even born yet get by thirty years from now. Will the crew help?"

Mr. Walther said quietly, "I think you can count on it."

"Good enough."

A small, red-faced man whose name Max had never learned interrupted. "Good enough, my eye! I'm going to sue the company, I'm going to sue the ship's officers individually. I'm going to shout it from the… " Max saw Sam slipping through the crowd to the man's side, the disturbance stopped abruptly.

"Take him to the Surgeon," Mr. Walther said wearily. "He can sue us tomorrow. The meeting is adjourned."

Max started for his room. Eldreth caught up with him. "Max! I want to talk with you."

"All right." He started back toward the lounge.

"No, I want to talk privately. Let's go to your room."

"Huh? Mrs. Dumont would blow her top, then she'd tell Mr. Walther."

"Bother with all that! Those silly rules are dead. Didn't you listen at the meeting?"

"You're the one who didn't listen."

He took her firmly by the arm, turned her toward the public room. They ran into Mr. and Mrs. Daigler coming the other way. Daigler said, "Max? Are you busy?"

"Yes," answered Eldreth.

"No," said Max.

"Hmm… you two had better take a vote. I'd like to ask Max some questions. I've no objection to your being with us, Eldreth, if you will forgive the intrusion.

She shrugged. "Oh, well, maybe you can handle him. I can't."

They went to the Daiglers' stateroom, larger and more luxurious than Max's and possessing two chairs. The two women perched on the bed, the men took the chairs. Daigler began, "Max, you impress me as a man who prefers to give a straight answer. There are things I want to know that I didn't care to ask out there. Maybe you can tell me."

"I will if I can."

"Good. I've tried to ask Mr. Simes, all I get is a snottily polite brush off. I haven't been able to get in to see the Captain—after today I see that there wouldn't have been any point anyhow. Now, can you tell me, with the mathematics left out, what chance we have to get home? Is it one in three, or one in a thousand—or what?"

"Uh, I couldn't answer it that way."

"Answer it your own way."

"Well, put it this way. While we don't know where we are, we know positively where we aren't. We aren't within, oh, say a hundred lightyears of any explored part of the Galaxy."

"How do you know? It seems to me that's a pretty big space to be explored in the weeks since we got off the track."

"It sure is. It's a globe twelve hundred trillion miles thick. But we didn't have to explore it, not exactly."

"Then how?"

"Well, sir, we examined the spectra of all first magnitude stars in sight—and a lot more. None of them is in our catalogues. Some are giants that would be first magnitude anywhere within a hundred lightyears of them—they'd be certain to be in the catalogues if a survey ship had ever been that close to them. So we are absolutely certain that we are a long, long way from anywhere that men have ever been before. Matter of fact, I spoke too conservatively. Make it a globe twice as thick, eight times as big, and you'd still be way over on the conservative side. We're *really* lost."

"Mmm… I'm glad I didn't ask those questions in the lounge. Is there any possibility that we will ever know where we are?"

"Oh, sure! There are thousands of stars left to examine. Chief Kelly is probably shooting one this minute."

"Well, then, what are the chances that we will eventually find ourselves?"

"Oh, I'd say they were excellent—in a year or two at the outside. If not from single stars, then from globular star clusters. You realize that the Galaxy is a hundred thousand lightyears across, more or less, and we can see only stars that are fairly close. But the globular clusters make good landmarks, too." Max added the mental reservation, *if we aren't in the wrong galaxy*. There seemed no point in burdening them with that dismaying possibility.

Daigler relaxed and took out a cigar. "This is the last of my own brand, but I'll risk smoking it now. Well, Maggie, I guess you won't have to learn how to make soap out of wood ashes and hog drippings after all. Whether it's one year or five, we can sweat it out and go home."

"I'm glad." She patted her ornate coiffure with soft, beautifully manicured hands. "I'm hardly the type for it."

"But you don't understand!"

"Eh? What's that, Max?"

"I didn't say we could get back. I just said I thought it was fairly certain we would find out where we are."

"What's the difference? We find out, then we go home."

"No, because we *can't* be less than a hundred lightyears from explored space."

"I don't see the hitch. This ship can do a hundred lightyears in a split second. What was the longest leap we made this cruise? Nearly five hundred lightyears, wasn't it?"

"Yes, but—" Max turned to Eldreth. "You understand? Don't you?"

"Well, maybe. That folded-scarf thing you showed me?"

"Yes, yes. Mr. Daigler, sure the *Asgard* can transit five hundred lightyears in no time—or any other distance. But *only* at calculated and surveyed congruencies. We don't know of any within a hundred lightyears, at least… and we won't know of any even if we find out where we are because we know where we *aren't*. Follow me? That means that the ship would have to travel at top speed for something over a hundred years and maybe much longer, just for the first leg of the trip."

Mr. Daigler stared thoughtfully at his cigar ash, then took out a pen knife and cut off the burning end. "I'll save the rest. Well, Maggie, better study up on that homemake soap deal. Thanks, Max. My father was a farmer, I can learn."

Max said impulsively, "I'll help you, sir."

"Oh yes, you did tell us that you used to be a farmer, didn't you? You should make out all right." His eyes swung to Eldreth. "You know what I would do, if I were you kids? I'd get the Captain to marry you right away. Then you'd be all set to tackle colonial life right."

Max blushed to his collar and did not look at Ellie. "I'm afraid I can't. I'm a crew member, I'm not eligible to colonize."

Mr. Daigler looked at him curiously. "Such devotion to duty. Well, no doubt Ellie can take her pick among the single men passengers."

Eldreth smoothed her skirt demurely. "No doubt."

"Come, Maggie. Coming, Eldreth?"

17 — CHARITY

"Charityville" was a going concern within a week. It had a mayor, Mr. Daigler, a main street, Hendrix Avenue, even its first wedding, performed by the mayor in the presence of the villagers—Mr. Arthur and little Becky Weberbauer. The first cottage, now building, was reserved for the newlyweds. It was a log cabin and a very sloppy job, for, while there were those among them who had seen pictures or had even seen log cabins, there was no one who had ever built one before.

There was an air of hope, of common courage, even of gaiety in the new community. The place was fragrant with new starts, forward-looking thoughts. They still slept in the ship and breakfasted there, then carried their lunches and labored mightily, men and women alike, through the short day—Charity spun on her axis in twenty-one-plus hours. They returned at nightfall, dined in the ship, and some found energy to dance a bit before going to bed.

Charity seemed to be all that her name implied. The days were balmy, the nights were mild—and beautiful beyond anything yet found in the Galaxy. Its star (they simply called it "the Sun") was accompanied by more comets than had yet been seen around any star. A giant with a wide tail stretched from zenith to western horizon, diving at their Sun. Another, not yet so grand but awesome enough to have caused watchers for the end of the world on Earthly hilltops, approached from the north, and two more decorated the southern sky with lace of icy fire.

Concomitant with comets was, necessarily, an equal abundance of meteors. Every night was a shower of falling stars, every day ended like Solar Union Day with a display of fireworks.

They had seen no dangerous animals. Some of the settlers reported seeing centaurlike creatures about the size of Shetland ponies, but they seemed timid and had scurried away when discovered. The prevalent life form appeared to be marsupial mammals in various sizes and shapes. There were no birds, but there was another sort of flying life not found elsewhere—jellyfishlike creatures four or five feet high with dangling tendrils, animated balloons. They appeared to have muscular control over their swollen bladders for they could rise and fall, and could even, by some not evident means, go upwind against a gentle breeze—in higher winds they anchored to treetops, or floated free and let the wind carry them.

They seemed curious about Charityville and would hang over a work site, turning slowly around as if to see everything. But they never got within reach. Some of the settlers wanted to shoot one down and examine it; Mayor Daigler forbade it.

There was another animal too—or might be. They were called "peekers" because all that anyone had seen was something that ducked quickly behind a rock or tree when anyone tried to look. Between the possibly mythical peeker and the ubiquitous balloons the colonists felt that their new neighbors took a deep but not unfriendly interest in what they were doing.

Maggie Daigler—she was "Maggie" to everyone now—had put away her jewels, drawn dungarees from ship's stores, and chopped off her hair. Her nails were short and usually black with grime. But she looked years younger and quite happy.

In fact, everyone seemed happy but Max.

Ellie was avoiding him. He cursed himself and his big mouth thrice daily and four times at night. Sure, Daigler had spoken out of turn—but was that any reason for him to open his mouth and put his foot in it? Of course, he had never figured on marrying Ellie—but shucks, maybe they were stuck here forever. "Probably," not "maybe," he corrected. The ban on joining the colony would be let up in time—in which case, what was the sense in getting in bad with the only eligible girl around?

An astrogator ought to be a bachelor but a farmer needed a wife. Mighty nice to have some one cooking the turnip greens and jointing a chicken while a man was out in the fields. He ought to know—Maw had let it slide often enough. Ellie wouldn't be like Maw. She was strong and practical and with just a little teaching would do all right.

Besides she was about the prettiest thing he ever saw, if you looked at her right.

When Mr. and Mrs. Dumont, by special dispensation, joined the colony it caused him to act. Since the steward and stewardess would have no duties in a ship without passengers no one could reasonably object—but it gave Max an approach. He went to see the First Officer.

"Probationary Apprentice Jones, sir."

Walther glanced up. "I think I'd say 'Assistant Astrogator Jones' if I were you. Closer to the facts. Come in."

"Uh, that's what I wanted to speak with you about, sir."

"So? How?"

"I want to revert to my billet."

"Eh? Why would you rather be a chartsman than an astrogator? And what difference does it make—now?"

"No, sir. I'm electing to resume my permanent appointment, steward's mate third."

Walther looked amazed. "There must be more to this. Explain yourself."

With much stammering Max explained his trouble with Simes. He tried to be fair and finished with the dismal feeling that he had sounded childish. Walther said, "You're sure about this? Mr. Simes has said nothing to me about you."

"He wouldn't, sir. But it's true. You can ask Kelly."

Walther thought for a while. "Mr. Jones, I wouldn't attach too much importance to this. At your age these conflicts of personality often seem more serious than they are. My advice is to forget it and do your work. I'll speak to Mr. Simes about his keeping you out of the control room. That isn't proper and I am surprised to hear it."

"No, sir."

"'No, sir' what?"

"I want to return to steward's mate."

"Eh? I don't understand you."

"Because, sir, I want to join the colony. Like Chief Steward Dumont."

"Oh… A light begins to dawn." Walther slapped the desk emphatically. "Absolutely no! Under no circumstances."

"Sir?"

"Please understand me. This is not discrimination. If you were a steward's mate and nothing else, I would consider your request—under the special circumstances which I believe pertain. But you are an astrogator. You know our situation. Dr. Hendrix is dead. Captain Blaine—well, you have seen him. He may recover, I cannot plan on it. Mr. Jones, as long as there is any faint hope that this ship will ever lift again, as long as we have crew to work her, no astrogator, no chartsman, no computerman will be relieved from duty for any reason whatsoever. You see that, don't you?"

"I guess so, sir. Uh, aye aye, sir."

"Good. By the way, keep this to yourself, but as soon as the colony can get along without us temporarily, I want the ship placed in a parking orbit so that you specialists can maintain a search. You can't work very well through this atmosphere, can you?"

"No, sir. Our instruments were designed for open space."

"So we must see that you get it." The First Officer sat silent, then added, "Mr. Jones—Max, isn't it? May I speak to you man to man?"

"Uh? Certainly, sir."

"Mmm… Max, this is none of my business, but treat it as fatherly advice. If you have an opportunity to marry—and want to—you don't have to join the colony to do it. If we stay, it won't matter in the long run whether you are crew or a charter member of the village. If we leave, your wife goes with you."

Max's ears burned. He could think of nothing to say.

"Hypothetical question, of course. But that's the proper solution." Walther stood up. "Why don't you take the day off? Go take a walk or something. Fresh air will do you good. I'll speak to Mr. Simes."

Instead, Max went looking for Sam, did not find him in the ship, discovered that he had gone dirtside. He followed him down and walked the half mile to Charityville.

Before he reached the building that was being worked on he saw a figure separate itself from the gang. He soon saw that it was Eldreth. She stopped in front of him, a sturdy little figure in dirty dungarees. She planted her feet and set fists on her hips.

"Uh, howdy, Ellie."

"Up to your old tricks! Avoiding me. Explain yourself."

The injustice of it left him stuttering. "But… Now see here, Ellie, it's not that way at all. You've been…"

"A likely story. You sound like Chipsie caught with her hand in a candy dish. I just wanted to tell you, you reluctant Don Juan, that you have nothing to worry about. I'm not marrying anyone this season. So you can resume the uneven tenor of your ways."

"But, Ellie… " he started desperately.

"Want me to put it in writing? Put up a bond?" She looked fiercely at him, then began to laugh, wrinkling her nose. "Oh, Max, you large lout, you arouse the eternal maternal in me. When you are upset your face gets as long as a mule's. Look, forget it."

"But, Ellie… Well, all right."

"Pals?"

"Pals."

She sighed. "I feel better. I don't know why, but I don't like to be on the outs with you. Where were you going?"

"Uh, nowhere. Taking a walk."

"Fine. I'll go too. Half a sec while I gather in Chipsie." She turned and called, "Mister Chips! Chipsie!"

"I don't see her."

"I'll get her." She ran off, to return quickly with the spider puppy on her shoulder and a package in her hand. "I picked up my lunch. We can split it."

"Oh, we won't be gone that long. Hi, Chipsie baby."

"Hi, Max. Candy?"

He dug into a pocket, found a sugar cube that he had saved several days ago for the purpose; the spider puppy accepted it gravely and said, "Thank you."

"Yes, we will," Ellie disagreed, "because some of the men saw a herd of those centaur ponies the other side of that ridge. It's quite a hike."

"I don't think we ought to go that far," he said doubtfully. "Won't they miss you?"

"I've been doing my share. See my callouses?" She stuck out a grimy paw. "I told Mr. Hornsby that I was suddenly come down with never-get-overs and he would have to find somebody else to hold while he hammered."

He was pleased to give in. They went up rising ground and into an arroyo and soon were in a grove of primitive conifers. Mr. Chips jumped down from Ellie's shoulders and scurried up a tree. Max stopped. "Hadn't we better catch her?"

"You worry too much. Chipsie wouldn't run away. She'd be scared to death. Chipsie! Here, honey!"

The spider puppy hustled through branches, got directly above them, dropped a cone on Max. Then she laughed, a high giggle. "See? She just wants to play."

The ridge was high and Max found that his hillbilly's wind had been lost somewhere among the stars. The arroyo meandered slowly upwards. He was still woodsman enough to keep a sharp eye out for landmarks and directions. At weary last they topped the crest. Ellie paused. "I guess they're gone," she said disappointedly, staring out over flatter country below them. "No! Look over there. See them! About two dozen little black dots."

"Uh huh. Yeah."

"Let's go closer. I want a good look."

"I wonder if that's smart? We're a far piece from the ship and I'm not armed."

"Oh, they're harmless."

"I was thinking of what else might be in these woods."

"But we're already in the woods, and all we've seen are the hobgoblins." She referred to the balloonlike creatures, two of which had trailed them up the arroyo. The humans had grown so used to their presence that they no longer paid them any attention.

"Ellie, it's time we went back."

"No."

"Yes. I'm responsible for you. You've seen your centaurs."

"Max Jones, I'm a free citizen. You may be starting back; I'm going to have a close look at those underslung cow ponies." She started down.

"Well—Wait a moment. I want to get my bearings." He took a full look around, fixed the scene forever in his mind, and followed her. He was not anxious to thwart her anyhow; he had been mulling over the notion that this was a good time to explain why he had said what he had said to Mr. Daigler—and perhaps lead around to the general subject of the future. He wouldn't go so far as to talk about marriage—though he might bring it up in the abstract if he could figure out an approach.

How did you approach such a subject? You didn't just say, "There go the hobgoblins, let's you and me get married!"

Ellie paused. "There go the hobgloblins. Looks as if they were heading right for the herd."

Max frowned. "Could be. Maybe they talk to them?"

She laughed. "Those things?" She looked him over carefully. "Maxie, I've just figured out why I bother with you."

Huh? Maybe she was going to lead up to it for him. "Why?"

"Because you remind me of Putzie. You get the same puzzled look he does."

"'Putzie?' Who is Putzie?"

"Putzie is the man my father shipped me off to Earth to get me away from—and the reason I crushed out of three schools to get back to Hespera. Only Daddy will probably have shipped him off, too. Daddy is tricky. Come here, Chipsie. Don't go so far."

She continued, "You'll love Putzie. He's nice. Stop it, Chipsie."

Max despised the man already. "I don't like to fret you," he said, "but it's a long way to Hespera."

"I know. Let's not borrow trouble." She looked him over again. "I might keep you in reserve, if you weren't so jumpy."

Before he could think of the right answer she had started down.

The centaurs—it seemed the best name, though the underparts were not much like horses and the parts that stuck up were only vaguely humanoid—clustered near the foot of the hill, not far out from the trees. They weren't grazing, it was hard to tell what they were doing. The two hobgoblins were over the group, hovering as if in interest just as they did with humans. Ellie insisted on going to the edge of the clearing to see them better.

They reminded Max of clowns made up to look like horses. They had silly, simple expressions and apparently no room for a brain case. They appeared to be marsupials, with pouches almost like bibs. Either they were all females or with this species the male had a pouch too. Several little centaurs were cavorting around, in and out the legs of their elders.

One of the babies spied them, came trotting toward them, sniffling and bleating. Behind it the largest adult pulled out of the herd to watch the young one. The colt scampered up and stopped about twenty feet away.

"Oh, the darling!" Ellie said and ran out a few feet, dropped to one knee. "Come here, pet. Come to mama."

Max started for her. "Ellie! Come back here!"

The large centaur reached into its pouch, hauled out something, swung it around its head like a gaucho's throwing rope. "Ellie!"

He reached her just as it let go. The thing struck them, wound around and held them. Ellie screamed and Max struggled to tear it loose—but they were held like Laocoön.

Another line came flying through the air, clung to them. And another.

Mr. Chips had followed Ellie. Now she skittered away, crying. She stopped at the edge of the clearing and shrilled, "Max! Ellie! Come *back*. *Please* back!"

18 — CIVILIZATION

Ellie did not faint nor grow hysterical. After that involuntary scream, her next remark was simply, "Max, I'm sorry. My fault."

The words were almost in his ear, so tightly were they tied together by the clinging ropes. He answered, "I'll get us loose!" and continued to strain at their bonds.

"Don't struggle," she said quietly, "It just makes them tighter. We'll have to talk our way out of this."

What she said was true; the harder he strained the tighter the pythonlike bonds held them. "Don't," Ellie pleaded. "You're making it worse. It's hurting me." Max desisted.

The largest centaur ambled up and looked them over. Its broad simple face was still more ludicrous close up and its large brown eyes held a look of gentle astonishment. The colt approached from the other side and sniffed curiously, bleated in a high voice. The adult bugled like an elk; the colt shied sideways, then rejoined the herd on a dead run.

"Take it easy," Ellie whispered. "I think they were scared that we would hurt the baby. Maybe they'll just look us over and let us go."

"Maybe. But I wish I could get at my knife."

"I'm glad you can't. This calls for diplomacy."

The rest of the herd came up, milled around and looked them over, while exchanging calls that combined bugling, whinnying, and something between a cough and a snort. Max listened. "That's language," he decided.

"Of course. And how I wish I had studied it at Miss Mimsey's."

The largest centaur leaned over them, smoothed at their bonds; they became looser but still held them. Max said sharply, "I think they are going to untie us. Get ready to run."

"Yes, boss."

Another centaur reached into its builtin pouch, took out another of the ropelike things. It dropped to its fore knees, flipped the end so that it curled around Max's left ankle. The end seemed to weld into a loop, hobbling Max as effectively as a bowline knot; Ellie was treated the same way. The biggest centaur then patted their bonds, which fell off and writhed gently on the ground. It picked them up and stuffed them into its pouch.

The centaur which had hobbled them wrapped the ends of their tethers around its upright trunk, they merged into a belt. After an exchange of sour bugle calls with the leader, it patted the leashes… which then stretched like taffy, becoming quite twenty feet long and much more slender. Max pressed his knife on Ellie and said, "Try to cut yourself loose. If you can, then run for it. I'll keep them busy."

"No, Max."

"Yes! Dawggone it, quit being a brat! You've made enough trouble."

"Yes, Max." She took the knife and tried to saw through the strange rope near her ankle. The centaurs made no attempt to stop her, but watched with the same air of gentle astonishment. It was as if they had never seen a knife, had no notion of what one was. Presently she gave up. "No good, Max. It's like trying to slice duraplastic."

"Why, I keep that knife like a razor. Let me try."

He had no better luck. He was forced to stop by the herd moving out—walk or be dragged. He managed to close the knife while hopping on one foot to save his balance. The group proceeded at a slow walk for a few steps, then the leader bugled and the centaurs broke into a trot, exactly like ancient cavalry.

Ellie stumbled at once and was dragged. Max sat down, managed to grab his hobble and hang on while shouting, "Hey! Stop!"

Their captor stopped and looked around almost apologetically. Max said, "Look, stupid. We can't keep up. We're not horses," while helping Ellie to her feet. "Are you hurt, kid?"

"I guess not." She blinked back tears. "If I could lay hands on that hayburning oaf, he'd be hurt—plenty!"

"You skinned your hand."

"It won't kill me. Just tell him to slow down, will you?"

Seeing them on their feet the monster immediately started to trot again. Down they went again, with Max trying to drag them to a halt. This time the leader trotted back from the main herd and consulted their custodian. Max took part, making up in vehemence what he lacked in semantic efficiency.

Perhaps he was effective; their keeper slowed to a fast walk, letting the others go ahead. Another centaur dropped back and became a rear guard. One of the animated balloons, which had continued to hover over the herd, now drifted back and remained over Max and Ellie.

The pace was just bearable, between a fast walk and a dogtrot. The route led across the open, flat floor of the valley and through knee-high grass. The grass saved them somewhat, as the centaur leading them seemed to feel that a fall or two every few hundred yards represented optimum efficiency. He never seemed impatient and would stop and let them get up, but always started off again at a clip brisk for humans. Max and Ellie ceased trying to talk, their throats being burned dry by their panting efforts to keep up. A tiny stream meandered through the bottom of the valley; the centaur jumped easily across it. It was necessary for the humans to wade. Ellie paused in midstream, leaned down and started to drink. Max objected, "Ellie! Don't drink that—you don't know that it's safe."

"I hope it poisons me so I can lie down and die. Max, I can't go much farther."

"Chin up, kid. We'll get out of this. I've been keeping track of where we've gone." He hesitated, then drank also, being terribly thirsty. The centaur let them, then tugged them on.

It was as far again to the rising ground and forest on the other side. They had thought that they were as tired as they could be before they started up hill; they were mistaken. The centaur was agile as a goat and seemed surprised that they found it difficult. Finally Ellie collapsed and would not get up; the centaur came back and stirred her roughly with a three-toed hoof.

Max struck him with both fists. The centaur made no move to retaliate but looked at him with that same stupid astonishment. Their rear guard came up and conversed with it, after which they waited for perhaps ten minutes. Max sat down beside Ellie and said anxiously, "Feeling any better?"

"Don't talk."

Presently the guard edged between them and drove Max back by stepping on him, whereupon the other centaur tugged on Ellie's leash. It contracted and she was forced to scramble to her feet. The centaurs let them rest twice after that. After an endless time, when the local sun was dropping low in the west, they came out on flat table land, still heavily wooded. They continued through trees for a distance which Max's count of paces told him was under a mile but seemed like ten, then stopped.

They were in a semi-clearing, a space carpeted with fallen needles. Their guard came up to the other centaur and took from him the end of Max's leash, flipped it around the base of a tree, to which it clung. The other centaur did the same with Ellie's leash to another tree about forty feet away. Having done so, they roughly urged the two together, while stopping to stroke their bonds until they were stretched out very thin. It allowed Max and Ellie enough slack that they might have passed each other.

This did not seem to please the centaurs. One of them shifted Max's leash farther back into the surrounding bushes, dragging him with it. This time at the extreme limit allowed by their bonds they were about six feet apart. "What are they doing?" asked Ellie.

"Looks like they don't want us to combine forces."

Finished, the centaurs trotted away. Ellie looked after them, began to sob, then cried openly, tears running down her dirty face and leaving tracks. "Stow it," Max said harshly. "Sniffling will get us nowhere."

"I can't help it," she bawled. "I've been brave all day—at least I've tried to be. I… " She collapsed face down and let herself go.

By getting down prone and stretching Max could just reach her head. He patted her tangled hair. "Take it easy, kid," he said softly. "Cry it out, if you'll feel better."

"Oh, Maxie! Tied up… like a dog."

"We'll see about that." He sat up and examined his tether.

Whatever the ropelike leash was, it was not rope. It had a smooth shiny surface which reminded him more of a snake, though the part that wound around his ankle showed no features; it simply flowed around his ankle and merged back into itself.

He lifted the bight and detected a faint throbbing. He stroked it as he had seen the centaurs do and it responded with flowing pulsations, but it neither shrank nor grew longer, nor did it loosen its grip. "Ellie," he announced, "This thing is *alive*."

She lifted a woebegone face. "What thing?"

"This rope."

"Oh, that! Of course."

"At least," he went on, "if it isn't, it's not really dead." He tried his knife again, there was no effect. "I'll bet if I had a match I could make it cry 'Uncle.' Got an Everlite, Ellie?"

"I don't smoke."

"Neither do I. Well, maybe I can make a fire some other way. Rubbing two sticks together, or something."

"Do you know how?"

"No." He continued stroking and patting the living rope, but, though he always got a response in pulsations, he did not seem to have the right touch; the bond stayed as before. He was continuing this fruitless attempt when he heard his name called. "Max! Ellie!"

Ellie sat up with a jerk. "Chipsie! Oh, Max, she followed us. Come here, darling!"

The spider puppy was high above them in a tree. She looked carefully around, then scurried down, making the last ten feet a flying leap into Ellie's arms. They cuddled and made soft noises, then Ellie straightened up, her eyes shining. "Max, I feel so much better."

"So do I." He added, "Though I don't know why."

The spider puppy announced gravely, "Chipsie follow."

Max reached across and petted her. "Yes, Chipsie did. Good girl!"

Ellie hugged the spider puppy. "I don't feel deserted now, Max. Maybe everything will come out all right."

"Look, Ellie, we're not in too bad a spot. Maybe I'll find the combination to tickle these ropes or snakes or whatever so they'll give up. If I do, we'll sneak back tonight."

"How would we find our way?"

"Don't worry. I watched every foot of the way, every change of direction, every landmark."

"Even in the dark?"

"Easier in the dark. I know these stars—I sure ought to. But suppose we don't get loose; we still aren't licked."

"Huh? I don't relish spending my life tied to a tree."

"You won't. Look—I think these things are just curious about us. They won't eat us, that's sure—they probably live on grass. Maybe they'll get bored and turn us loose. But if they don't, it'll be rough on them."

"Huh? Why?"

"Because of Mr. Walther and George Daigler—and Sam, Sam Anderson; that's why. They're probably beating the bushes for us right now. We are less than ten miles from the ship—five by a straight line. They'll find us. Then if these silly-looking centaurs want to get tough, they'll learn about modern weapons. They and their fool throwing ropes!"

"It might take a long time to find us. Nobody knows where we went."

"Yes," he admitted. "If I had a pocket radio. Or some way to signal. Or even a way to build a fire. But I don't."

"I never thought. It just seemed like going for a stroll in the park."

Max thought darkly that he had tried to warn her. Why, even the hills around home weren't safe if a body didn't keep his eyes peeled... you could run into a mean old bobcat, or even a bear. Person like Ellie never 'ud had enough hard knocks to knock sense into her, that was her trouble.

Presently he admitted that he himself hadn't looked for grief from anything as apparently chuckled-headed and harmless as these centaur things. Anyhow, as Sam would say, no use cryin' over spilt milk when the horse was already stolen.

"Ellie."

"Huh?"

"Do you suppose Chipsie could find her way back?"

"Why, I don't know."

"If she could, we could send a message."

Chipsie looked up. "Back?" she inquired. "Please back. Go home."

Ellie frowned. "I'm afraid Chipsie doesn't talk that well. She'd probably just hiccup and get incoherent."

"I don't mean that. I know Chipsie is no mental giant. I..."

"Chipsie is smart!"

"Sure. But I want to send a written message and a map." He fumbled in a pocket, pulled out a stylus. "Do you have any paper?"

"I'll see." She found a folded paper in a dungaree pocket. "Oh, dear! I was supposed to take this to Mr. Giordano. Mr. Hornsby will be so vexed with me."

"What is it?"

"A requisition for number-ten wire."

"It doesn't matter now." He took the paper, scratched out the memorandum, turned it over and began to draw, stopping to consult the pictures filed in his mind for distances, which way the local sun lay, contours, and other details.

"Max?"

"Quiet, can't you?" He continued to sketch, then added: "URGENT—to First Officer Walther: Eldreth Coburn and self captured by centaurs. Be careful and watch out for their throwing ropes. Respectfully, M. Jones." He handed it to Ellie. "That ought to do it. Is there any way to fasten it to her? I sure don't want her to drop it."

"Mmm... let me see. Turn your back, Max."

"Why?"

"Don't be difficult. Turn your back."

He did so, shortly she said, "All right now." He faced her and she handed him a ribbon. "How's this?"

"Swell!" They managed to tie the ribbon, with the note folded and firmly attached, around Mr. Chips' waist, anchoring it to a middle limb… not too easy as the spider puppy seemed to think it was a game and was ticklish as well.

"There! Stop squirming, Chipsie, and listen. Ellie wants you to go home."

"Home?"

"Yes, home. Go back to the ship."

"Ellie go home?"

"Ellie can't go home."

"No."

"Honey, you've *got* to."

"No."

"Look, Chipsie. You find Maggie and tell her Ellie said to give you some candy. You give Maggie this." She tugged at the tied note.

"Candy?"

"Go home. Find Maggie. Maggie will give you candy."

"Ellie go home."

"Please, Chipsie."

"Ellie," Max said urgently, "something is coming."

Eldreth looked up, saw a centaur coming through the trees. She pointed. "Look, Chipsie! They're coming! They'll catch Chipsie! Go home! Run!"

The spider puppy squealed in terror and scurried for the trees. Once on a branch she looked back and whimpered. "Go home!" screamed Ellie. "Find Maggie!"

Mr. Chips shot a glance at the centaur, then disappeared. They had no time to worry further, the centaur was almost up to them. He glanced at them and went on by; it was what followed the centaur that grabbed their attention. Ellie suppressed a shriek. "Max! They've caught everybody."

"No," he corrected grimly. "Look again." The gathering gloom had caused him to make the same mistake; it seemed that the entire ship's company trotted after the centaur in single file, ankle leashed to ankle by living ropes. But only the first glance gave such an impression. These creatures were more than humanoid—but such degraded creatures had never sailed between the stars.

They shuffled quickly along like well-trained animals. One or two looked at Ellie and Max in passing, but their stares were bovine, incurious. Small children not on leash trotted with their mothers, and once Max was startled to see a wrinkled little head peeping out of a pouch—these man-creatures were marsupials, too.

Max controlled a desire to retch and as they passed out of sight he turned to Ellie. "Gosh!"

"Max," Eldreth said hoarsely, "do you suppose we've died and gone to our punishment?"

"Huh? Don't be silly. Things are bad enough."

"I mean it. That was something right out of Dante's Inferno."

Max was swallowing uneasily and not feeling good-tempered. "Look, you can pretend you're dead if you want to. Me, I'm alive and I mean to stay so. Those things weren't men. Don't let it throw you."

"But they *were* men. Men and women and children."

"No, they weren't. Being shaped like us doesn't make them men. Being a man is something else entirely." He scowled. "Maybe the centaurs are 'men.'"

"Oh, no—"

"Don't be too sure. They seem to run things in this country."

The discussion was cut short by another arrival. It was almost dark and they did not see the centaur until he entered their clearing. He was followed by three of the—Max decided to call them 'men' though he resented the necessity—followed by three men. They were not on leashes. All three were bearing burdens. The centaur spoke to them; they distributed what they carried.

One of them set down a large clay bowl filled with water in the space separating Max and Ellie. It was the first artifact that any human had seen on Charity and did not indicate a high level of mechanical culture, being crudely modeled and clearly not thrown on a potter's wheel; it held water, no more could be said for it. A second porter dumped a double armful of small fruits beside the bowl. Two of them splashed into the bowl, he did not bother to fish them out.

Max had to look twice to see what the third slave was carrying. It looked as if he had three large ovoid balls slung by ropes in each of his hands; second inspection showed them to be animals about the size of opossums which he carried by their tails. He went around the clearing, stopping every few feet and lifting one of his burdens to a lower branch. When he had finished they were surrounded by six small creatures, each hanging by its tail. The centaur followed the slave, Max saw him stroke each animal and press a spot on its neck. In each case the entire body of the little animal lit up, began to shine like a firefly with soft silvery light.

The clearing was softly illuminated thereby—well enough, Max thought, to read large print. One of the hobgoblins balloons came sailing silently between trees and anchored to a point thirty feet above them; it seemed to settle down for the night.

The centaur came over to Max and prodded him with a hoof, snorting inquiringly. Max listened carefully, then repeated the sound. The centaur answered and again Max mimicked. This useless exchange continued for a few phrases, then the centaur gave up and left, his train trotting after him.

Ellie shivered. "Phew!" she exclaimed, "I'm glad they're gone. I can stand the centaurs, a little, but those men… ugh!"

He shared her disgust; they looked less human close up, having hair lines that started where their eyebrows should have been. They were so flatheaded that their ears stuck up above their skulls. But it was not this that had impressed Max. When the centaur had spoken to him Max had gotten his first good look into a centaur's mouth. Those teeth were never meant for munching grain, they were more like the teeth of a tiger—or a shark.

He decided not to mention this. "Say, wasn't that the same one that was leading the herd that caught us?"

"How would I know? They all look alike."

"But they don't, any more than two horses look alike."

"Horses all look alike."

"But… " He stopped, baffled by a city viewpoint at which communication failed. "I think it was the same one."

"I can't see that it matters."

"It might. I'm trying to learn their language."

"I heard you swallowing your tonsils. How did you do that?"

"Oh, you just remember what a sound sounds like, then do it." He threw his head back and made a very plaintive sound.

"What was *that?*"

"A shote stuck in a fence. Little shote by the name of Abner I had once."

"It sounds tragic."

"It was, until I helped him loose. Ellie, I think they've bedded us down for the night." He gestured at the bowl and the fruit beside it. "Like feeding the hogs."

"Don't put it that way. Room service. Room service and maid service and lights. Food and drink." She picked up one of the fruits. It was about the size and shape of a cucumber. "Do you suppose this is fit to eat?"

"I don't think you ought to try it. Ellie, it would be smart not to eat or drink anything until we are rescued."

"Well, maybe we could go hungry but we certainly can't go without water. You die of thirst in a day or two."

"But we may be rescued before morning."

"Maybe." She peeled the fruit. "It smells good. Something like a banana."

He peeled one and sniffed it. "More like a pawpaw."

"Well?"

"Mmm—Look here, I'll eat one. If it hasn't made me sick in a half hour, then you can try one."

"Yes, sir, boss man." She bit into the one she held. "Mind the seeds."

"Ellie, you're a juvenile delinquent."

She wrinkled her nose and smiled. "You say the sweetest things! I try to be."

Max bit into his. Not bad—not as much flavor as a pawpaw, but not bad. Some minutes later he was saying, "Maybe we should leave some for breakfast?"

"All right. I'm full anyway." Ellie leaned over and drank. Without words they had each concluded that the cloying meal required them to risk the water. "There, I feel better. At least we'll die comfortably. Max? Do you think we dare sleep? I'm dead."

"I think they are through with us for the night. You sleep, I'll sit up."

"No, that's not fair. Honest, what good would it do to keep watch? We can't get away."

"Well… here, take my knife. You can sleep with it in your hand."

"All right." She reached across the bowl and accepted it. "Good night, Max. I'm going to count sheep."

"Good night." He stretched out, shifted and got a tree cone out of his ribs, then tried to relax. Fatigue and a full stomach helped, the knowledge of their plight hindered—and that hobgoblin hanging up there. Maybe *it* was keeping watch—but not for their benefit.

"Max? Are you asleep?"

"No, Ellie."

"Hold my hand? I'm *scared.*"

"I can't reach it."

"Yes, you can. Swing around the other way."

He did so, and found that he could reach over his head past the water bowl and clasp her hand. "Thanks, Max. Good night some more."

He lay on his back and stared up through the trees. Despite the half light given by the luminiferous animals he could see stars and the numerous meteor trails crisscrossing the sky. To avoid thinking he started counting them. Presently they started exploding in his head and he was asleep.

The light of the local sun through the trees awakened him. He raised his head. "I wondered how long you would sleep," Eldreth announced. "Look who's here."

He sat up, wincing with every move, and turned around. Mr. Chips was sitting on Ellie's middle and peeling one of the papaya-like fruits.

"Lo, Maxie."

"Hello, Chipsie." He saw that the note was still tied to her. "Bad girl!"

Mr. Chips turned to Ellie for comfort. Tears started to leak out. "No, no," corrected Ellie. "Good girl. She's promised to go find Maggie as soon as she finishes breakfast. Haven't you, dear?"

"Go find Maggie," the spider puppy agreed.

"Don't blame her, Max. Spider puppies aren't nocturnal back home. She just waited until we were quiet, then came back. She couldn't help it. I found her sleeping in my arm."

The spider puppy finished eating, then drank daintily from the bowl. Max decided that it didn't matter, considering who had probably used it before they had. This thought he suppressed quickly. "Find Maggie," Mr. Chips announced.

"Yes, dear. Go straight back to the ship as fast as you can and find Maggie. Hurry."

"Find Maggie. Hurry fast. 'Bye, Maxie." The spider puppy took to the trees and scampered away in the right direction.

"Do you think she'll get there?" asked Max.

"I think so. After all, her ancestors found their way through forests and such for a lot of generations. She knows it's important; we had a long talk."

"Do you really think she understands that much?"

"She understands about pleasing me and that's enough. Max, do you suppose they can possibly reach us today? I don't want to spend another night here."

"Neither do I. If Chipsie can move faster than we can…"

"Oh, she can."

"Then maybe—if they start quickly."

"I hope so. Ready for breakfast?"

"Did Chipsie leave anything?"

"Three apiece. I've had mine. Here."

"Sure you're lying? There were only five when we went to sleep." She looked sheepish and allowed him to split the odd one. While they were eating he noticed a change. "Hey, what became of the oversized lightning bugs?"

"Oh. One of those awful creatures came at dawn and carried them away. I was set to scream but he didn't come close to me, so I let you sleep."

"Thanks. I see our chaperone is with us." The hobgoblin still hung in the tree tops.

"Yes, and there have been peekers around all morning, too."

"Did you get a look at one?"

"Of course not." She stood up, stretched and winced. "Now to see what beautiful surprises this lovely day brings forth." She made a sour face. "The program I would pick is to sit right here and never lay eyes on anything until George Daigler shows up with about a dozen armed men. I'd kiss him. I'd kiss all of them."

"So would I."

Until well past noon Eldreth's chosen schedule prevailed, nothing happened. They heard from time to time the bugling and snorting of centaurs but saw none. They talked in desultory fashion, having already disposed of both hopes and fears, and were dozing in the sunshine, when they suddenly came alert to the fact that a centaur was entering the clearing.

Max felt sure that it was the leader of the herd, or at least that it was the one who had fed and watered them. The creature wasted no time, making it clear with kicks and prods that they were to allow themselves to be leashed for travel.

Never once were they free of the living ropes. Max thought of attacking the centaur, perhaps leaping on his back and cutting his throat. But it seemed most unlikely that he could do it quietly enough; one snort might bring the herd down on them. Besides which he knew no way to get free of their bonds even if he killed the centaur. Better wait—especially with a messenger gone for help.

They were led, falling and being dragged occasionally, along the route taken by the party of slaves. It became apparent that they were entering a large centaur settlement. The path opened out into a winding, well-tended road with centaurs going both directions and branching off onto side roads. There were no buildings, none of the outward marks of a civilized race—but there was an air of organization, of custom, of stability. Little centaurs scampered about, got in the way, and were ordered aside. There was activity of various sorts on both sides of the road and grotesque human slaves were almost as numerous as centaurs, carrying burdens, working in unexplained fashions—some with living-rope bonds, some allowed to run free. They could not see much because of the uncomfortable pace they were forced to maintain.

Once Max noted an activity on his side of the road that he wished to see better. He did not mention it to Ellie, not only because talking was difficult but because he did not wish to worry her—but it had looked like an outdoor butcher shop to him. The hanging carcasses were not centaurs.

They stopped at last in a very large clearing, well filled with centaurs. Their master patted the lines that bound them and thereby caused them to shorten until they were fetched close to his sides. He then took his place in a centaur queue.

A large, grizzled, and presumably elderly centaur was holding court on one side of the "square." He stood with quiet dignity as single centaurs or groups came in succession before him. Max watched with interest so great that he almost lost his fear. Each case would be the cause of much discussion, then the centaur chieftain would make a single remark and the case would be over. The contestants would leave quietly. The conclusion was inescapable that law or custom was being administered, with the large centaur as arbiter.

There was none of the travesties of men in the clearing but there were underfoot odd animals that looked like flattened-out hogs. Their legs were so short that they seemed more like tractor treads. They were mostly mouth and teeth and snuffling snouts, and whatever they came to, if it was not a centaur's hoof, they devoured. Max understood from watching them how the area, although thickly inhabited, was kept so clean; these scavengers were animated street cleaners.

Their master gradually worked up toward the head of the line. The last case before theirs concerned the only centaur they had seen which did not seem in vibrant health. He was old and skinny, his coat was dull and his bones stuck pitifully through his hide. One eye was blind, a blank white; the other was inflamed and weeping a thick ichor.

The judge, mayor, or top herd leader discussed his case with two younger healthy centaurs who seemed to be attending him almost as nurses. Then the boss centaur moved from his position of honor and walked around the sick one, inspecting him from all sides. Then he spoke to him.

The old sick one responded feebly, a single snorted word. The chief centaur spoke again, got what seemed to Max the same answer. The chief backed into his former position, set up a curious whinnying cry.

From all sides the squatty scavengers converged on the spot. They formed a ring around the sick one and his attendants, dozens of them, snuffling and grunting. The chief bugled once; one attendant reached into its pouch and hauled forth a creature curled into a knot, the centaur stroked it and it unwound. To Max it looked unpleasantly like an eel.

The attendant extended it toward the sick centaur. It made no move to stop him, but waited, watching with his one good eye. The head of the slender thing was suddenly touched to the neck of the sick centaur; he jerked in the characteristic convulsion of electric shock and collapsed.

The chief centaur snorted once—and the scavengers waddled forward with surprising speed, swarming over the body and concealing it. When they backed away, still snuffling, there were not even bones.

Max called out softly, "Steady, Ellie! Get a grip on yourself, kid."

She answered faintly, "I'm all right."

19 — A FRIEND IN NEED

For the first time they were turned loose. Their master tickled their bonds, which dropped from their ankles. Max said softly to Ellie, "If you want to run for it, I'll keep them busy."

Ellie shook her head. "No good. They'd have me before I went fifty feet. Besides—I can't find my way back."

Max shut up, knowing that she was right but having felt obliged to offer. The chief centaur inspected them with the characteristic expression of gentle surprise, exchanged bugling comments with their captor. They were under discussion for some time, there appeared to be some matter to be decided. Max got out his knife. He had no plan, other than a determination that no centaur would approach either one of them with that electric-shock creature, or any other menace, without a fight.

The crisis faded away. Their captor flicked their leashes about their ankles and dragged them off. Fifteen minutes later they were again staked out in the clearing they had occupied. Ellie looked around her after the centaur had gone and sighed. "'Be it ever so humble… ' Max, it actually feels good to get back here."

"I know."

The monotony that followed was varied by one thing only: fading hope and mounting despair. They were not treated unkindly; they were simply domestic animals—fed and watered and largely ignored. Once a day they were given water and plenty of the native papayas. After the first night they no longer had the luxury of "artificial" light, nor did the hobgoblin hang over their clearing. But there was no way of escape, short of gnawing off a leg and crawling away.

For two or three days they discussed the possibility of rescue with mounting anxiety, then, having beaten the subject to death they dropped it; it simply added to their distress. Ellie rarely smiled now and she had quit her frivolous back talk; it seemed that it had finally gotten through her armor that this could happen to Eldreth Coburn, only daughter of the rich and almost all-powerful Mr. Commissioner Coburn—a chattel, a barnyard animal of monsters themselves suitable only for zoos.

Max took it a little more philosophically. Never having had much, he did not expect much—not that he enjoyed it. He kept his worst fear secret. Ellie referred to their status as "animals in a zoo" because most of their visitors were small centaurs who came sniffling and bleating around with a curiosity that their elders seemed to lack. He let her description stand because he believed their status worse than that—he thought that they were being fattened for the table.

One week after their capture Eldreth declined to eat breakfast and stayed silent all morning. All that Max could think of to say evoked only monosyllables. In desperation he said, "I'll beat you at three-dee and spot you two starships."

That roused her. "You and who else?" she said scornfully. "And with what?"

"Well, we could play it in our heads. You know—blindfold."

She shook her head. "No good. You'd claim your memory was better than mine and I wouldn't be able to prove you were cheating."

"Nasty little brat."

She smiled suddenly. "That's better. You've been too gentle with me lately—it depresses me. Max, we could make a set."

"How?"

"With these." She picked up one of many tree cones that littered the clearing. "A big one is a flagship. We can pick various sizes and break the thingamajigs off and such."

They both got interested. The water bowl was moved aside so that it no longer occupied the center of the space marked by the limits of their tethers and the no-man's-land between them was brushed free of needles and marked with scratches as boards. The boards had to be side by side; they must stack them in their minds, but that was a common expedient for players with good visualization when using an unpowered set—it saved time between moves.

Pebbles became robots; torn bits of cloth tied to cones distinguished sides and helped to designate pieces. By midafternoon they were ready. They were still playing their first game when darkness forced them to stop. As they lay down to sleep Max said, "I'd better not take your hand. I'd knock over men in the dark."

"I won't sleep if you don't—I won't feel safe. Besides, that gorilla messed up one board changing the water."

"That's all right. I remember where they were."

"Then you can just remember where they all are, Stretch out your arm."

He groped in the darkness, found her fingers. "Night, Max. Sleep tight."

"Good night, Ellie."

Thereafter they played from sunup to sundown. Their owner came once, watched them for an hour, went away without a snort. Once when Ellie had fought him to a draw Max said, "You know, Ellie, you play this game awfully well—for a girl."

"Thank you too much."

"No, I mean it. I suppose girls are probably as intelligent as men, but most of them don't act like it. I think it's because they don't have to. If a girl is pretty, she doesn't have to think. Of course, if she can't get by on her looks, then—well, take you for example. If you..."

"*Oh!* So I'm ugly, Mr. Jones!"

"Wait a minute. I didn't say that. Let's suppose that you were the most beautiful woman since Helen of Troy. In that case, you would... " He found that he was talking to her back. She had swung round, grabbed her knees, and was ignoring him.

He stretched himself to the limit of his tether, bound leg straight out behind him, and managed to touch her shoulder. "Ellie?"

She shook off his hand. "Keep your distance! You smell like an old goat."

"Well," he said reasonably, "you're no lily yourself. You haven't had a bath lately either."

"I know it!" she snapped, and started to sob. "And I hate it. I just... h-h- *hate* it. I look *awful.*"

"No, you don't. Not to. me."

She turned a tear-wet and very dirty face. "Liar."

"Nothing wrong that some soap and water won't fix."

"Oh, if only I had some." She looked at him. "You aren't at your best yourself, Mr. Jones. You need a haircut and the way your beard grows in patches is ghastly."

He fingered the untidy stubble on his chin. "I can't help it."

"Neither can I." She sighed. "Set up the boards again."

Thereafter she beat him three straight games, one with a disgraceful idiot's mate. He looked at the boards sadly when it was over. "And you are the girl who flunked improper fractions?"

"Mr. Jones, has it ever occurred to you, the world being what it is, that women sometimes prefer not to appear too bright?" He was digesting this when she added, "I learned this game at my father's knee, before I learned to read. I was junior champion of Hespera before I got shanghaied. Stop by sometime and I'll show you my cup."

"Is that true? Really?"

"I'd rather play than eat—when I can find competition. But you're learning. Someday you'll be able to give me a good game."

"I guess I don't understand women."

"That's an understatement."

Max was a long time getting to sleep that night. Long after Eldreth was gently snoring he was still staring at the shining tail of the big comet, watching the shooting star trails, and thinking. None of his thoughts was pleasant.

Their position was hopeless, he admitted. Even though Chipsie had failed (he had never pinned much hope on her), searching parties should have found them by now. There was no longer any reason to think that they would be rescued.

And now Ellie was openly contemptuous of him. He had managed to hurt her pride again—again with his big, loose, flapping jaw! Why, he should have told her that she was the prettiest thing this side of paradise, if it would make her feel good—she had mighty little to feel good about these days!

Being captive had been tolerable because of her, he admitted—now he had nothing to look forward to but day after day of losing at three-dee while Ellie grimly proved that girls were as good as men and better. At the end of it they would wind up as an item in the diet of a thing that should never have been born.

If only Dr. Hendrix hadn't died!

If only he had been firm with Ellie when it mattered.

To top it off, and at the moment almost the worst of all, he felt that if he ate just one more of those blasted pawpaws it would gag him.

He was awakened by a hand on his shoulder and a whisper in his ear. "Max!"

"What the—?"

"*Quiet!* Not a sound."

It was Sam crouching over him—Sam!

As he sat up, sleep jarred out of him by adrenalin shock, he saw Sam move noiselessly to where Ellie slept. He squatted over her but did not touch her. "Miss Eldreth," he said softly.

Ellie's eyes opened and stared. She opened her mouth, Max was terrified that she might cry out. Sam hastily signed for silence; she looked at him and nodded. Sam knelt over her, seemed to study something in the shadow-laced moonlight, then took out a hand gun. There was the briefest of low-energy discharges, entirely silent, and Ellie stood up—free. Sam returned to Max. "Hold still," he whispered. "I don't want to burn you." He knelt over Max's bound ankle.

When the gun flared Max felt an almost paralyzing constriction around his ankle, then the thing fell off. The amputated major part contracted and jerked away into the shadows. Max stood up. "How—"

"Not a word. Follow me." Sam led off into the bushes with Ellie behind him and Max following closely. They had gone only twenty yards when there was a whimpering cry of "Ellie!" and the spider puppy landed in Eldreth's arms. Sam turned suddenly.

"Keep her quiet," he whispered, "for your life."

Ellie nodded and started petting the little creature, crooning to it voicelessly. When Chipsie tried to talk, she silenced it, then stuffed it inside her shirt. Sam waited these few moments, now started on without speaking.

They proceeded for several hundred yards as near silently as three people who believe their lives hang on it can manage. Finally Sam stopped. "This is as far as we dare go," he said in a low voice. "Any farther in the dark and I'd be lost. But I'm pretty sure we are outside their sleeping grounds. We'll start again at the first light."

"How did you get here in the dark, then?"

"I didn't. Chips and I have been hiding in thick bushes since midafternoon, not fifty feet from you."

"Oh." Max looked around, looked up at the stars. "I can take us back in the dark."

"You can? It 'ud be a darn good thing. These babies don't stir out at night—I think."

"Let me get in the lead. You get behind Ellie."

It took more than an hour to get to the edge of the tableland. The darkness, the undergrowth, the need for absolute silence, and the fact that Max had to take it slowly to keep his bearings despite his photographic memory all slowed them down. The trip downhill into the valley was even slower.

When they reached the edge of the trees with comparatively flat grassland in front Sam halted them and surveyed the valley by dim moonlight. "Mustn't get caught in the open," he whispered. "They can't throw those snakes too well among trees, but out in the open—oh, brother!"

"You know about the throwing ropes?"

"Sure."

"Sam," whispered Ellie. "Mr. Anderson, why did…"

"Sssh!" he cautioned. "Explanations later. Straight across, at a dogtrot. Miss Eldreth, you set the pace. Max, pick your bearings and guide us. We'll run side by side. All set?"

"Just a minute." Max took the spider puppy from Eldreth, zipping it inside his shirt as she had done. Mr. Chips did not even wake up, but moaned softly like a disturbed baby. "Okay."

They ran and walked and ran again for a half hour or more, wasting no breath on words, putting everything into gaining distance from the centaur community. Knee-high grass and semi-darkness made the going hard. They were almost to the bottom of the valley and Max was straining to spot the stream when Sam called out, "Down! Down flat!"

Max hit dirt, taking it on his elbows to protect Chips; Ellie flopped beside him. Max turned his head cautiously and whispered, "Centaurs?"

"No. Shut up."

A hobgoblin balloon, moving at night to Max's surprise, was drifting across the valley at an altitude of about a hundred feet. Its course would take it past them, missing them by perhaps a hundred yards. Then it veered and came toward them.

It lost altitude and hovered almost over them. Max saw Sam aim carefully, steadying his pistol with both bands. There was momentarily a faint violet pencil from gun to hobgoblin; the creature burst and fell so close by that Max could smell burned meat. Sam returned his weapon and got to his feet. "One less spy," he said with satisfaction. "Let's get going, kids."

"You think those things spy?"

"'Think'? We know. Those polo ponies have this place *organized.* Pipe down and make miles."

Ellie found the stream by falling into it. They hauled her out and waded across, stopping only to drink. On the other bank Sam said, "Where's your left shoe, Miss Eldreth?"

"It came off in the brook."

Sam stopped to search but it was useless; the water looked like ink in the faint light. "No good," he decided. "We could waste the whole night. You're due for sore feet—sorry. Better throw away your other shoe."

It did not slow them until they reached the far ridge beyond which lay Charityville and the ship. Soon after they started up Ellie cut her right foot on a rock. She did her best, setting her jaw and not complaining, but it handicapped them. There was a hint of dawn in the air by the time they reached the top. Max started to lead them down the arroyo that he and Ellie had come up so many year-long days ago. Sam stopped him. "Let me get this straight. This isn't the draw that faces the ship, is it?"

"No, that one is just north of this." Max reconstructed in his mind how it had looked from the ship and compared it with his memory of the photomap taken as the ship landed. "Actually a shoulder just beyond the next draw faces the ship."

"I thought so. This is the one Chips led me up, but I want us to stay in the trees as long as possible. It'll be light by the time we'd be down to the flat."

"Does it matter? There have never been any centaurs seen in the valley the ship is in."

"You mean you never saw any. You've been away, old son. We're in danger now—and in worse danger the closer we get to the ship. Keep your voice down—and lead us to that shoulder that sticks out toward the ship. If you can."

Max could, though it meant going over strange terrain and keeping his bearings from his memory of a small-scale map. It involved "crossing the furrows," too, instead of following a dry water course—which led to impasses such as thirty-foot drops that had to be gone painfully around. Sam grew edgy as the light increased and urged them to greater speed and greater silence even as Ellie's increasingly crippled condition made his demands harder to meet.

"I really am sorry," he whispered after she had to slide and scramble down a rock slope, checking herself with bare and bloody feet. "But it's better to get there on stumps than to let them catch you."
